

GENERAL INFORMATION FOR THE RULES AND REGULATIONS FOR THE CLASSIFICATION OF NAVAL SHIPS

JANUARY 2010

Lloyd's Register is an exempt charity under the UK Charities Act 1993

Lloyd's Register, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as the 'Lloyd's Register Group'. The Lloyd's Register Group assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register Group entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

General Information

1. The 2010 edition of the Rules and Regulations for the Classification of Naval Ships is a complete reprint of the 2009 edition, consisting of 7 books.

General Information for the Rules and Regulations for the Classification of Naval Ships	
Volume 1, Part 1	Regulations
Rules for the Manufacture, Testing and Certification of Materials	
Volume 1, Parts 3-6	Ship Structures
Volume 1, Part 7	Enhanced Structural Assessment (Provisional)
Volume 2, Parts 1-11	Machinery and Engineering Systems
Volume 3, Parts 1-3	Additional Optional Requirements

2. A decimal notation system has been adopted throughout. Five sets of digits cover the divisions, i.e. Part, Chapter, Section, sub-Section and paragraph. The textual cross-referencing within the text is as follows, although the right hand digits may be added or omitted depending on the degree of precision required:
 - (a) In same Chapter, e.g. see 2.1.3 (i.e. down to paragraph).
 - (b) In same Part but different Chapter, e.g. see Ch 3,2.1 (i.e. down to sub-Section).
 - (c) In another Part, e.g. see Pt 5, Ch 1,3 (i.e. down to Section).

The cross-referencing for Figures and Tables is as follows:

 - (a) In same Chapter, e.g. as shown in Fig. 2.3.5 (i.e. Chapter, Section and Figure Number).
 - (b) In same Part but different Chapter, e.g. as shown in Fig. 2.3.5 in Chapter 2.
 - (c) In another Part, e.g. see Table 2.7.1 in Pt 3, Ch 2.

3. The primary changes from the 2009 edition of the Rules are identified in the Guide Book. The effective date of the indicated changes is 1 August 2008, 1 January 2009, 1 April 2009, 1 July 2009 and 1 January 2010.

4. Until the next edition of the Rules and Regulations for the Classification of Naval Ships is published, Rule change Notices and/or Corrigenda, as necessary, will be published on the LR Webstore — <http://www.webstore.lr.org> — and will be available for downloading free of charge. It is not intended at this time to publish hard copies of future Rule Notices to Existing Rules.

5. In this publication a shortened version of the Notice has been reproduced listing all the paragraphs that have been altered since the last edition of the Rules. It is followed by comprehensive Contents list of all books in the set, showing all the titles down to Section level.

Notice – Summary of Changes

Summary of Changes from the 2009 Rules

Effective Date 1 August 2008

<i>Ch</i>	<i>Section</i>	<i>Para</i>	<i>Section Title</i>	<i>Status</i>	<i>Notice</i>
Rules for the Manufacture, Testing and Certification of Materials					
12	–	Whole Chapter	Fabricated Steel Sections	Chapter deleted	1
12	–	Whole Chapter	Welding Qualifications	New Chapter added	1
13	–	Whole Chapter	Welded Steel Machinery Structures	Chapter deleted	1
13	–	Whole Chapter	Requirements for Welded Construction	New Chapter added	1

Effective Date 1 January 2009

<i>Ch</i>	<i>Section</i>	<i>Para</i>	<i>Section Title</i>	<i>Status</i>	<i>Notice</i>

Contents

Volume 1, Part 1, Regulations

PART	1	REGULATIONS
CHAPTER	1	GENERAL REGULATIONS
Sections		1 to 8
CHAPTER	2	CLASSIFICATION REGULATIONS
Section	1	Conditions for Classification
Section	2	Scope of the Rules
Section	3	Character of Classification and Class notations
Section	4	Surveys – General
Section	5	Type Approval/Type Testing/Quality Control System
Section	6	Classification of machinery with [✱]LMC or MCH notation
Section	7	Classification of ship with *IWS notation
Section	8	Classification of ship with operational role: Oil Supply Ship
Section	9	Classification of naval ships using alternative LR's Rules
CHAPTER	3	PERIODICAL SURVEY REGULATIONS
Section	1	General
Section	2	Annual Surveys – Hull, machinery and optional requirements
Section	3	Intermediate Surveys – Hull and machinery requirements
Section	4	Docking Surveys and In-water Surveys
Section	5	Special Survey – Hull requirements
Section	6	Special Survey – Thickness measurement requirements for steel ships
Section	7	Machinery survey – General requirements
Section	8	Turbines – Detailed requirements
Section	9	Oil engines – Detailed requirements
Section	10	Electrical equipment
Section	11	Boilers
Section	12	Steam pipes
Section	13	Screwshafts, tube shafts and propellers
Section	14	Hull planned maintenance, HPMS
Section	15	Machinery planned maintenance and condition monitoring, MPMS, MCM and RCM
Section	16	Classification of ships not built under LR survey
Section	17	Classification of ships built under survey to LR Classification Rules and Regulations other than LR Naval Ship Rules and Regulations

RULES FOR THE MANUFACTURE, TESTING AND CERTIFICATION OF MATERIALS

CHAPTER	1	GENERAL REQUIREMENTS
Section	1	Scope
Section	2	Approval and survey requirements
Section	3	Certification of materials
Section	4	General requirements for manufacture
CHAPTER	2	TESTING PROCEDURES FOR METALLIC MATERIALS
Section	1	General requirements for testing
Section	2	Tensile tests
Section	3	Impact tests
Section	4	Ductility tests for pipes and tubes
Section	5	Embrittlement tests
Section	6	Crack tip opening displacement tests
Section	7	Bend tests
Section	8	Corrosion tests

Contents

CHAPTER	3	ROLLED STEEL PLATES, STRIP, SECTIONS AND BARS
Section	1	General requirements
Section	2	Normal strength steels for ship and other structural applications
Section	3	Higher strength steels for ship and other structural applications
Section	4	Steels for boilers and pressure vessels
Section	5	Steels for machinery fabrications
Section	6	Ferritic steels for low temperature service
Section	7	Austenitic and duplex stainless steels
Section	8	Plates with specified through thickness properties
Section	9	Bars for welded chain cables
Section	10	High strength quenched and tempered steels for welded structures
 CHAPTER	 4	 STEEL CASTINGS
Section	1	General requirements
Section	2	Castings for ship and other structural applications
Section	3	Castings for machinery construction
Section	4	Castings for crankshafts
Section	5	Castings for propellers
Section	6	Castings for boilers, pressure vessels and piping systems
Section	7	Ferritic steel castings for low temperature service
Section	8	Stainless steel castings
Section	9	Steel castings for container corner fittings
 CHAPTER	 5	 STEEL FORGINGS
Section	1	General requirements
Section	2	Forgings for ship and other structural applications
Section	3	Forgings for shafting and machinery
Section	4	Forgings for crankshafts
Section	5	Forgings for gearing
Section	6	Forgings for turbines
Section	7	Forgings for boilers, pressure vessels and piping systems
Section	8	Ferritic steel forgings for low temperature service
Section	9	Austenitic stainless steel forgings
 CHAPTER	 6	 STEEL PIPES AND TUBES
Section	1	General requirements
Section	2	Seamless pressure pipes
Section	3	Welded pressure pipes
Section	4	Ferritic steel pressure pipes for low temperature service
Section	5	Austenitic stainless steel pressure pipes
Section	6	Boiler and superheater tubes
 CHAPTER	 7	 IRON CASTINGS
Section	1	General requirements
Section	2	Grey iron castings
Section	3	Spheroidal or nodular graphite iron castings
Section	4	Iron castings for crankshafts
 CHAPTER	 8	 ALUMINIUM ALLOYS
Section	1	Plates, bars and sections
Section	2	Aluminium alloy rivets
Section	3	Aluminium alloy castings
Section	4	Aluminium/steel transition joints
 CHAPTER	 9	 COPPER ALLOYS
Section	1	Castings for propellers
Section	2	Castings for valves, liners and bushes
Section	3	Tubes

Contents

CHAPTER 10	EQUIPMENT FOR MOORING AND ANCHORING
Section 1	Anchors
Section 2	Stud link chain cables for ships
Section 3	Stud link mooring chain cables
Section 4	Studless mooring chain cables
Section 5	Short link chain cables
Section 6	Steel wire ropes
Section 7	Fibre ropes
CHAPTER 11	APPROVAL OF WELDING CONSUMABLES
Section 1	General
Section 2	Mechanical testing procedures
Section 3	Electrodes for manual and gravity welding
Section 4	Wire-flux combinations for submerged-arc automatic welding
Section 5	Wires and wire-gas combinations for manual, semi-automatic and automatic welding
Section 6	Consumables for use in electro-slag and electro-gas welding
Section 7	Consumables for use in one-side welding with temporary backing materials
Section 8	Consumables for welding austenitic and duplex stainless steels
Section 9	Consumables for welding aluminium alloys
CHAPTER 12	WELDING QUALIFICATIONS
Section 1	General qualification requirements
Section 2	Welding Procedure Qualification Tests for Steels
Section 3	Specific requirements for stainless steels
Section 4	Welding procedure tests for non-ferrous alloys
Section 5	Welder qualification tests
CHAPTER 13	REQUIREMENTS FOR WELDED CONSTRUCTION
Section 1	General welding requirements
Section 2	Specific requirements for ship hull and machinery
Section 3	Specific requirements for fabricated steel sections
Section 4	Specific requirements for fusion welded pressure vessels
Section 5	Specific requirements for pressure pipework
Section 6	Repair of existing ships by welding
Section 7	Austenitic and duplex stainless steel – Specific requirements
CHAPTER 14	PLASTICS MATERIALS
Section 1	General requirements
Section 2	Tests on polymers, resins, reinforcements and associated materials
Section 3	Testing procedures
Section 4	Plastics pipes and fittings
Section 5	Control of material quality for composite construction

Volume 1, Parts 3 to 6, Ship Structures

PART 3	DESIGN PRINCIPLES AND CONSTRUCTIONAL ARRANGEMENTS
CHAPTER 1	GENERAL
Section 1	Rules application
Section 2	Direct calculations
Section 3	Equivalents
Section 4	Information required
Section 5	Definitions
Section 6	Building tolerances and associated repairs
Section 7	Inspection and testing

Contents

CHAPTER	2	SHIP DESIGN
Section	1	General
Section	2	Rule structural concept
Section	3	Main hull structure
Section	4	Bulkhead arrangements
Section	5	Fore and aft end arrangements
Section	6	Machinery space arrangements
Section	7	Superstructures, deckhouses, bulwarks, sponsons and appendages
Section	8	Pillars and pillar bulkheads
CHAPTER	3	SHIP CONTROL SYSTEMS
Section	1	General
Section	2	Rudders
Section	3	Stabiliser arrangements
Section	4	Rudder horns and appendages
Section	5	Fixed and steering nozzles, bow and stern thrust units, ducted propellers
Section	6	Waterjet propulsion systems
CHAPTER	4	CLOSING ARRANGEMENTS AND OUTFIT
Section	1	Introduction
Section	2	Hatches and miscellaneous openings on the weather deck
Section	3	Doors and accesses on weather decks
Section	4	Side lights and windows
Section	5	Ventilators
Section	6	Air pipes
Section	7	Scuppers and sanitary discharges
Section	8	Bulwarks, guard rails and other means for the protection of crew and embarked personnel
Section	9	Lagging and lining of structure
CHAPTER	5	ANCHORING, MOORING, TOWING, BERTHING, LAUNCHING, RECOVERY AND DOCKING
Section	1	General
Section	2	Equipment Number
Section	3	Service area factors
Section	4	Anchors
Section	5	Anchor cable
Section	6	Moorings ropes
Section	7	Towing arrangements
Section	8	Windlass and capstan design and testing
Section	9	Structural details
Section	10	Launch and recovery, berthing and docking arrangements
CHAPTER	6	STRUCTURAL PROCEDURES FOR THE DESIGN, CONSTRUCTION AND LIFETIME CARE OF SHIPS
Section	1	General
Section	2	Structural Design Assessment
Section	3	Fatigue Design Assessment
Section	4	Construction Monitoring
Section	5	Ship Event Analysis
Section	6	Enhanced Scantlings
Section	7	Protective Coating in Water Ballast Tanks
Section	8	Hull Condition Monitoring
Section	9	Ship Emergency Response Service

Contents

PART	4	MILITARY DESIGN AND SPECIAL FEATURES
CHAPTER	1	MILITARY DESIGN
Section	1	General requirements
Section	2	Survivability
Section	3	Military distinction notations
Section	4	Military design guidance
Section	5	Military design requirements
Section	6	Magazine design and construction
Section	7	Design guidance for nuclear, biological and chemical defence
Section	8	Design guidance for the reduction of radiated noise underwater due to sea-inlets or other openings
CHAPTER	2	MILITARY LOAD SPECIFICATION
Section	1	General requirements
Section	2	External blast
Section	3	Internal blast
Section	4	Fragmentation protection
Section	5	Underwater explosion (shock)
Section	6	Whipping
Section	7	Residual strength
Section	8	Strengthening requirements for beach landing operations
Section	9	Military installation and operational loads
Section	10	Aircraft operations
CHAPTER	3	SPECIAL FEATURES
Section	1	General
Section	2	Vehicle decks and fixed ramps
Section	3	Bow doors
Section	4	Side, stern doors and other shell openings
Section	5	Movable decks, lifts, internal and external ramps
PART	5	ENVIRONMENTAL LOADS
CHAPTER	1	GENERAL
Section	1	Introduction
Section	2	Direct calculations
Section	3	Model experiments
CHAPTER	2	ENVIRONMENTAL CONDITIONS
Section	1	General
Section	2	Wave environment
Section	3	Air environment
Section	4	Guidance for ice environment
CHAPTER	3	LOCAL DESIGN LOADS
Section	1	Introduction
Section	2	Motion response
Section	3	Loads on shell envelope
Section	4	Impact loads on external plating
Section	5	Local design loads for decks and bulkheads
Section	6	Other local loads
Section	7	Ice loads
CHAPTER	4	GLOBAL DESIGN LOADS
Section	1	General
Section	2	Still water global loads
Section	3	Global hull girder loads
Section	4	Extreme hull girder loads
Section	5	Residual strength hull girder loads
Section	6	Loading guidance information

Contents

PART	6	HULL CONSTRUCTION IN STEEL
CHAPTER	1	GENERAL
Section	1	Application
Section	2	General requirements
CHAPTER	2	DESIGN TOOLS
Section	1	General
Section	2	Structural design
Section	3	Buckling
Section	4	Vibration control
Section	5	Dynamic loading
CHAPTER	3	SCANTLING DETERMINATION
Section	1	General
Section	2	Minimum structural requirements
Section	3	NS1 scantling determination
Section	4	NS2 and NS3 scantling determination
Section	5	Shell envelope plating
Section	6	Shell envelope framing
Section	7	Single bottom structures
Section	8	Double bottom structures
Section	9	Bulkheads and deep tanks
Section	10	Deck structures
Section	11	Superstructures, deckhouses and bulwarks
Section	12	Pillars and pillar bulkheads
Section	13	Machinery and raft seatings
Section	14	Strengthening for bottom slamming
Section	15	Strengthening for wave impact loads above waterline
CHAPTER	4	HULL GIRDER STRENGTH
Section	1	General
Section	2	Hull girder strength
Section	3	Extreme Strength Assessment, ESA
Section	4	Residual Strength Assessment, RSA
CHAPTER	5	STRUCTURAL DESIGN FACTORS
Section	1	Structural design factors
Section	2	Scantling determination for NS1 ships
Section	3	Scantling determination for NS2 and NS3 ships
CHAPTER	6	MATERIAL AND WELDING REQUIREMENTS
Section	1	General
Section	2	Materials
Section	3	Requirements for welded construction
Section	4	Welded joints and connections
Section	5	Construction details
Section	6	Inspection and testing procedures

Volume 1, Part 7, Enhanced Structural Assessment (Provisional)

PART	7	ENHANCED STRUCTURAL ASSESSMENT
CHAPTER	1	GENERAL
Section	1	General
Section	2	Total Load Assessment, TLA
Section	3	Structural Design Assessment, SDA

Contents

CHAPTER	2	TOTAL DESIGN LOADS
Section	1	General
Section	2	Nomenclature and design factors
Section	3	Design load combinations
Section	4	Design load systems for longitudinally effective components
Section	5	Design load systems for structural components or longitudinally ineffective material
CHAPTER	3	TOTAL LOAD ASSESSMENT, TLA
Section	1	Introduction
Section	2	Structural resistance
Section	3	Stress analysis model
Section	4	Structural design factors

Volume 2, Parts 1-11, Machinery and Engineering Systems

PART	1	GENERAL REQUIREMENTS
CHAPTER	1	GENERAL REQUIREMENTS FOR CLASSIFICATION OF ENGINEERING SYSTEMS
Section	1	Scope
Section	2	Engineering system classification provisions
Section	3	Engineering system designation
Section	4	Engineering system classification principles
Section	5	Acceptance criteria
Section	6	Routes to conformance
Section	7	Certification of materials
Section	8	Quality assurance scheme for machinery
Section	9	Type approval system (for information)
CHAPTER	2	REQUIREMENTS FOR DESIGN, CONSTRUCTION, INSTALLATION AND SEA TRIALS OF ENGINEERING SYSTEMS
Section	1	Scope
Section	2	General provisions
Section	3	Particulars to be submitted
Section	4	Operating conditions
Section	5	Machinery space arrangements
Section	6	Diesel engines
Section	7	Turbo-chargers
Section	8	Gas turbines
Section	9	Steam turbines
Section	10	Gearing
Section	11	Shafting systems
Section	12	Propellers
Section	13	Water jet units
Section	14	Thrusters
Section	15	Steering systems
Section	16	Sea trials
Section	17	Failure Mode and Effects Analysis (FMEA)
Section	18	Fin stabilisers
Section	19	Fired galley arrangements
CHAPTER	3	REQUIREMENTS FOR FUSION WELDING OF PRESSURE VESSELS AND PIPING
Section	1	General
Section	2	Manufacture and workmanship of fusion welded pressure vessels
Section	3	Repairs to welds on fusion welded pressure vessels
Section	4	Post weld heat treatment of pressure vessels
Section	5	Welded pressure pipes
Section	6	Non-Destructive Examination
CHAPTER	4	SPARE GEAR FOR MACHINERY INSTALLATIONS
Section	1	General

Contents

CHAPTER 5 REQUIREMENTS FOR MACHINERY AND ENGINEERING SYSTEMS OF UNCONVENTIONAL DESIGN

Section 1 Requirements for machinery and engineering systems of unconventional design

PART 2 PRIME MOVERS

CHAPTER 1 DIESEL ENGINES

Section 1 General requirements
 Section 2 Particulars to be submitted
 Section 3 Materials
 Section 4 Crankshaft design
 Section 5 Construction and welded structures
 Section 6 Safety arrangements on engines
 Section 7 Starting arrangements
 Section 8 Piping systems
 Section 9 Control and monitoring
 Section 10 Alarms and safeguards for emergency diesel engines
 Section 11 Mass produced engines
 Section 12 Mass produced turbo-chargers
 Section 13 Type testing procedure for crankcase explosion relief valves
 Section 14 Type testing procedure for crankcase oil mist detection and alarm equipment
 Section 15 Electronically controlled engines

CHAPTER 2 GAS TURBINES

Section 1 General requirements
 Section 2 Particulars to be submitted
 Section 3 Materials
 Section 4 Design and construction
 Section 5 Piping systems
 Section 6 Starting arrangements
 Section 7 Control, alarm and safety systems
 Section 8 Planned maintenance and condition monitoring procedures, and 'upkeep by exchange'

CHAPTER 3 STEAM TURBINES

Section 1 General requirements
 Section 2 Particulars to be submitted
 Section 3 Materials
 Section 4 Design and construction
 Section 5 Emergency arrangements
 Section 6 Piping systems
 Section 7 Control and monitoring

PART 3 TRANSMISSION SYSTEMS

CHAPTER 1 GEARING

Section 1 Scope
 Section 2 Principles
 Section 3 Acceptance criteria
 Section 4 Design and construction
 Section 5 Plans and particulars to be submitted
 Section 6 Materials
 Section 7 Design
 Section 8 Sub-systems for gearing
 Section 9 Control and monitoring

CHAPTER 2 SHAFTING SYSTEMS

Section 1 General requirements
 Section 2 Particulars to be submitted
 Section 3 Materials
 Section 4 Design and construction
 Section 5 Control and monitoring

Contents

PART	4	PROPULSION DEVICES
CHAPTER	1	PROPELLERS
Section	1	Scope
Section	2	Principles
Section	3	Acceptance criteria
Section	4	Routes to conformance
Section	5	Plans and particulars
Section	6	Materials
Section	7	Propeller design
Section	8	Propeller tolerances
Section	9	Piping systems
Section	10	Control and monitoring
CHAPTER	2	WATER JET SYSTEMS
Section	1	Scope
Section	2	Particulars to be submitted
Section	3	Materials
Section	4	Design and construction
Section	5	Piping systems
Section	6	Control and monitoring
Section	7	Electrical systems
CHAPTER	3	THRUSTERS
Section	1	General requirements
Section	2	Particulars to be submitted
Section	3	Materials
Section	4	Design and construction
Section	5	Piping systems
Section	6	Control and monitoring
Section	7	Electrical systems
CHAPTER	4	PODDED PROPULSION UNITS
Section	1	Scope
Section	2	General requirements
Section	3	Functional capability
Section	4	Materials
Section	5	Structure design and construction requirements
Section	6	Machinery design and construction requirements
Section	7	Electrical equipment
Section	8	Control engineering arrangements
Section	9	Testing and trials
Section	10	Installation, maintenance and replacement procedures
PART	5	SHAFT VIBRATION AND ALIGNMENT
CHAPTER	1	TORSIONAL VIBRATION
Section	1	General requirements
Section	2	Details to be submitted
Section	3	Design
Section	4	Measurements
CHAPTER	2	AXIAL VIBRATION
Section	1	General requirements
Section	2	Details to be submitted
Section	3	Design
Section	4	Measurements
CHAPTER	3	LATERAL VIBRATION
Section	1	General requirements
Section	2	Details to be submitted
Section	3	Measurements

Contents

CHAPTER	4	SHAFT ALIGNMENT
Section	1	General requirements
Section	2	Details to be submitted
Section	3	Shaft alignment calculations

PART 6 STEERING SYSTEMS

CHAPTER	1	STEERING GEAR
Section	1	General requirements
Section	2	Particulars to be submitted
Section	3	Materials
Section	4	Performance
Section	5	Design and construction
Section	6	Steering control systems
Section	7	Electrical power circuits and equipment
Section	8	Monitoring and alarms
Section	9	Alternative sources of power and emergency operation

PART 7 PIPING SYSTEMS

CHAPTER	1	PIPING DESIGN REQUIREMENTS
Section	1	Scope
Section	2	General
Section	3	Assessment
Section	4	Materials
Section	5	Pipe connections
Section	6	Carbon and low alloy steel piping and components
Section	7	Copper and copper alloy piping and components
Section	8	Cast iron piping and components
Section	9	Stainless steel piping and components
Section	10	Aluminium piping and components
Section	11	Plastic piping and components
Section	12	Valves
Section	13	Flexible hoses
Section	14	Expansion pieces
Section	15	Pumps
Section	16	Testing
Section	17	Guidance notes on metal pipes for water service
Section	18	Heat exchangers

CHAPTER	2	SHIP PIPING SYSTEMS
Section	1	General requirements
Section	2	Construction and installation
Section	3	Drainage of compartments, other than machinery spaces
Section	4	Drainage of machinery spaces
Section	5	Size of dewatering suction pipes
Section	6	Drainage units on dewatering service and their connections
Section	7	Pipe systems and their fittings
Section	8	Cross flooding arrangements
Section	9	Additional requirements relating to fixed pressure fire-extinguishing systems
Section	10	Air, overflow and sounding pipes

Contents

CHAPTER 3 MACHINERY PIPING SYSTEMS

Section	1	General requirements
Section	2	Oil fuel – General requirements
Section	3	Oil fuel burning arrangements
Section	4	Oil fuel pumps, pipes, fittings, tanks, etc.
Section	5	Steam piping systems
Section	6	Boiler feed water and condensate systems
Section	7	Engine cooling water systems
Section	8	Lubricating oil systems
Section	9	Control, supervision and monitoring of equipment
Section	10	Multi-engined ships
Section	11	Electrical equipment cooling arrangements

CHAPTER 4 AIRCRAFT/HELICOPTER/VEHICLE FUEL PIPING AND ARRANGEMENTS

Section	1	General requirements
Section	2	Refuelling facilities
Section	3	Pump rooms

CHAPTER 5 SHIP TYPE PIPING SYSTEMS

Section	1	General requirements
Section	2	Construction and installation
Section	3	System arrangements
Section	4	Control arrangements
Section	5	Failure Mode and Effects Analysis
Section	6	Testing and trials
Section	7	Chilled water systems
Section	8	High pressure compressed air systems
Section	9	Low pressure compressed air systems
Section	10	High pressure sea-water systems
Section	11	Hydraulic power actuating systems

PART 8 PRESSURE PLANT

CHAPTER 1 STEAM RAISING PLANT AND ASSOCIATED PRESSURE VESSELS

Section	1	General requirements
Section	2	Cylindrical shells and drums subject to internal pressure
Section	3	Spherical shells subject to internal pressure
Section	4	Dished ends subject to internal pressure
Section	5	Conical ends subject to internal pressure
Section	6	Standpipes and branches
Section	7	Boiler tubes subject to internal pressure
Section	8	Headers
Section	9	Flat surfaces and flat tube plates
Section	10	Flat plates and ends of vertical boilers
Section	11	Furnaces subject to external pressure
Section	12	Boiler tubes subject to external pressure
Section	13	Tubes welded at both ends and bar stays for cylindrical boilers
Section	14	Construction
Section	15	Mounting and fittings for cylindrical and vertical boilers, steam generators, pressurised thermal liquid and pressurised hot water heaters
Section	16	Mountings and fittings for water tube boilers
Section	17	Hydraulic tests
Section	18	Control and monitoring

Contents

CHAPTER 2 OTHER PRESSURE VESSELS

Section	1	General requirements
Section	2	Cylindrical shells and drums subject to internal pressure
Section	3	Spherical shells subject to internal pressure
Section	4	Dished ends subject to internal pressure
Section	5	Dished ends for Class 3 pressure vessels
Section	6	Conical ends subject to internal pressure
Section	7	Standpipes and branches
Section	8	Construction
Section	9	Mountings and fittings
Section	10	Hydraulic tests
Section	11	Plate heat exchangers

PART 9 CONTROL ENGINEERING

CHAPTER 1 CONTROL ENGINEERING SYSTEMS

Section	1	General engineering systems
Section	2	Essential features for control, alarm and safety systems
Section	3	Unattended machinery space(s) – UMS notation
Section	4	Machinery operated from a centralised control station – CCS notation
Section	5	Integrated computer control – ICC notation
Section	6	Trials

PART 10 ELECTRICAL ENGINEERING

CHAPTER 1 ELECTRICAL ENGINEERING

Section	1	General requirements
Section	2	Main source of electrical power
Section	3	Emergency and alternative sources of electrical power
Section	4	External source of electrical power
Section	5	Supply and distribution
Section	6	System design – Protection
Section	7	Switchgear and control gear assemblies
Section	8	Rotating machines
Section	9	Converter equipment
Section	10	Electric cables and busbar trunking systems (busways)
Section	11	Batteries
Section	12	Equipment – Heating, lighting and accessories
Section	13	Electrical equipment for the use in explosive gas atmospheres or in the presence of combustible dusts
Section	14	Navigation and manoeuvring systems
Section	15	Electric propulsion
Section	16	Fire safety systems
Section	17	Crew and embarked personnel emergency safety systems
Section	18	Ship safety systems
Section	19	Lightning conductors
Section	20	Testing and trials
Section	21	Spare gear

PART 11 SUPPORT SYSTEMS

CHAPTER 1 MADE AND FRESH WATER SYSTEMS

Section	1	General requirements
Section	2	Construction and installation
Section	3	System arrangements
Section	4	Control and monitoring and electrical power arrangements
Section	5	Testing and trials

Contents

CHAPTER 2 HEATING, VENTILATION AND COOLING ARRANGEMENTS

Section	1	General requirements
Section	2	Construction and installation
Section	3	System arrangements
Section	4	Control and monitoring and electrical power arrangements
Section	5	Testing and trials

CHAPTER 3 WASTE SYSTEMS

Section	1	General requirements
Section	2	Construction and installation
Section	3	System arrangements
Section	4	Treatment of solid waste matter
Section	5	Control and monitoring and electrical power arrangements
Section	6	Testing and trials

Volume 3, Parts 1-3, Additional Optional Requirements

PART 1 ADDITIONAL SEA GOING FEATURES

CHAPTER 1 ICE NAVIGATION – FIRST YEAR ICE CONDITIONS

Section	1	General requirements
Section	2	Hull strengthening requirements
Section	3	Machinery and engineering systems

CHAPTER 2 INTEGRATED PROPULSION SYSTEMS

Section	1	General requirements
Section	2	Machinery arrangements
Section	3	Control arrangements

CHAPTER 3 DYNAMIC POSITIONING SYSTEMS

Section	1	General
Section	2	Class notation DP(CM)
Section	3	Class notation DP(AM)
Section	4	Class notation DP(AA)
Section	5	Class notation DP(AAA)
Section	6	Performance Capability Rating (PCR)
Section	7	Testing

CHAPTER 4 BRIDGE NAVIGATIONAL ARRANGEMENTS

Section	1	General requirements
Section	2	Physical conditions
Section	3	Workstations
Section	4	Systems
Section	5	Integrated Bridge Navigation Systems – IBS notation
Section	6	Trials

CHAPTER 5 PROPULSION AND STEERING MACHINERY REDUNDANCY

Section	1	General requirements
Section	2	Failure Mode and Effects Analysis (FMEA)
Section	3	Machinery arrangements
Section	4	Control arrangements
Section	5	Separate machinery spaces ★ (star) Enhancement
Section	6	Testing and trials

CHAPTER 6 MANOEUVRING ASSESSMENT

Section	1	General
Section	2	Assessment for LMA notation
Section	3	Assessment for LNMA notation
Section	4	Verification trials
Section	5	Guidelines on conducting ship verification trials

Contents

CHAPTER 7 REPLENISHMENT AT SEA (RAS) SYSTEMS

Section	1	General requirements
Section	2	Principles
Section	3	Acceptance criteria
Section	4	Design and construction
Section	5	Plans and particulars to be submitted
Section	6	Ship and arrangement requirements
Section	7	Ship operating system requirements
Section	8	RAS station requirements
Section	9	Transfer of liquids
Section	10	Transfer of solids
Section	11	Transfer of personnel
Section	12	RAS equipment
Section	13	Testing and trials
Section	14	Survey through life

PART 2 ADDITIONAL ENVIRONMENT AND SAFETY FEATURES

CHAPTER 1 NOISE AND VIBRATION LEVELS IN PERSONNEL SPACES

Section	1	General requirements
Section	2	Noise
Section	3	Vibration
Section	4	Testing
Section	5	Survey reporting
Section	6	Excessive noise and vibration
Section	7	Survey requirements
Section	8	Referenced standards

CHAPTER 2 ENVIRONMENTAL PROTECTION

Section	1	General requirements
Section	2	Environmental Protection (EP) class notation
Section	3	Supplementary characters
Section	4	Survey requirements

CHAPTER 3 PROVISION REFRIGERATION

Section	1	General requirements
Section	2	Construction and installation
Section	3	Refrigerating machinery and refrigerant storage compartment arrangements
Section	4	Refrigerant detection systems
Section	5	Control and monitoring and electrical power arrangements
Section	6	Personnel safety equipment and systems
Section	7	Testing and trials

PART 3 SAFETY EQUIPMENT AND ARRANGEMENTS

CHAPTER 1 GENERAL REQUIREMENTS

Section	1	Scope
Section	2	General information
Section	3	Definitions
Section	4	Integration for EER Notation
Section	5	Acceptance criteria
Section	6	Route to conformance

Contents

CHAPTER 2 FIRE PROTECTION

Section	1	Scope
Section	2	Classification requirements for fire protection systems
Section	3	Plans and particulars
Section	4	General requirements
Section	5	Fire prevention
Section	6	Fire detection
Section	7	Fire extinction
Section	8	Fire and by-product containment
Section	9	Personnel fire hazards
Section	10	System interaction
Section	11	Command and control
Section	12	Structural integrity

CHAPTER 3 ESCAPE AND EMERGENCY ACCESS

Section	1	Scope
Section	2	Classification requirements for escape and emergency access
Section	3	Plans and particulars
Section	4	General requirements
Section	5	Escape of personnel
Section	6	Emergency access

CHAPTER 4 LIFE-SAVING AND EVACUATION ARRANGEMENTS

Section	1	Scope
Section	2	Requirements for life-saving and evacuation arrangements
Section	3	Plans and particulars
Section	4	General requirements
Section	5	Evacuation of personnel
Section	6	Personnel protection
Section	7	Rescue of personnel
Section	8	Command and control

CHAPTER 5 SAFETY OF NAVIGATION AND COMMUNICATION

Section	1	Scope
Section	2	Classification requirements for safety of navigation and communication systems
Section	3	Plans and particulars
Section	4	General requirements
Section	5	Safety of communication
Section	6	Safety of navigation
Section	7	Safety of navigating and communication equipment arrangements

CHAPTER 6 POLLUTION PREVENTION

Section	1	Scope
Section	2	Requirements for pollution prevention arrangements
Section	3	Plans and particulars
Section	4	Prevention of pollution by oil and garbage
Section	5	Prevention of pollution by sewage and pollution of the air from ships

RULES AND REGULATIONS FOR THE CLASSIFICATION OF NAVAL SHIPS

VOLUME 1

JANUARY 2010

RULES AND REGULATIONS FOR THE CLASSIFICATION OF NAVAL SHIPS

VOLUME 1 PART 1
REGULATIONS

JANUARY 2010

A guide to the Rules

and published requirements

Rules and Regulations for the Classification of Naval Ships

Introduction

The Rules are published as a complete set, individual Parts are, however, available on request. A comprehensive List of Contents is placed at the beginning of each Part.

Numbering and Cross-References

A decimal notation system has been adopted throughout. Five sets of digits cover the divisions, i.e. Part, Chapter, Section, sub-Section and paragraph. The textual cross-referencing within the text is as follows, although the right hand digits may be added or omitted depending on the degree of precision required:

- (a) In same Chapter, e.g. see 2.1.3 (i.e. down to paragraph).
- (b) In same Part but different Chapter, e.g. see Ch 3,2.1 (i.e. down to sub-Section).
- (c) In another Part, e.g. see Pt 5, Ch 1,3 (i.e. down to Section).

The cross-referencing for Figures and Tables is as follows:

- (a) In same Chapter, e.g. as shown in Fig 2.3.5 (i.e. Chapter, Section and Figure Number).
- (b) In same Part but different Chapter, e.g. as shown in Fig. 2.3.5 in Chapter 2.
- (c) In another Part, e.g. see Table 2.7.1 in Pt 3, Ch 2.

Rules updating

The Rules are generally published annually and changed through a system of Notices. Subscribers are forwarded copies of such Notices when the Rules change.

Current changes to Rules that appeared in Notices are shown with a black rule alongside the amended paragraph on the left hand side. A solid black rule indicates amendments and a dotted black rule indicates corrigenda.

Rules programs

LR has developed a suite of Calculation Software that evaluates Requirements for Ship Rules, Special Service Craft Rules and Naval Ship Rules. For details of this software please contact LR.

Direct calculations

The Rules require direct calculations to be submitted for specific parts of the ship structure or arrangements and these will be assessed in relation to LR's own direct calculation procedures. They may also be required for ships of unusual form, proportion or speed, where intended for the carriage of special cargoes or for special restricted service and as supporting documentation for arrangements or scantlings alternative to those required by the Rules.

CHAPTER	3	PERIODICAL SURVEY REGULATIONS
Section	1	General
	1.1	Frequency of surveys
	1.2	Surveys for damage or alterations
	1.3	Unscheduled surveys
	1.4	Documentation
	1.5	Definitions
	1.6	Preparation for survey and means of access
	1.7	Repairs
	1.8	Thickness measurement at surveys
Section	2	Annual Surveys – Hull, machinery and optional requirements
	2.1	General
	2.2	Hull
	2.3	Machinery
	2.4	Other notations
Section	3	Intermediate Surveys – Hull and machinery requirements
	3.1	General
	3.2	Hull
	3.3	Machinery
Section	4	Docking Surveys and In-water Surveys
	4.1	General
	4.2	Docking Surveys
	4.3	In-water Surveys
Section	5	Special Survey – Hull requirements
	5.1	General
	5.2	Preparation
	5.3	Examination and testing – General
	5.4	Examination and testing – Additional items for steel ships
	5.5	Examination and testing – Additional items for composite ships
Section	6	Special Survey – Thickness measurement requirements for steel ships
	6.1	General
	6.2	Thickness measurement reporting
Section	7	Machinery survey – General requirements
	7.1	Annual, Intermediate and Docking Survey
	7.2	Complete Survey
Section	8	Turbines – Detailed requirements
	8.1	Complete Survey
	8.2	Turbine condition monitoring (TCM)
Section	9	Oil engines – Detailed requirements
	9.1	Complete Survey
Section	10	Electrical equipment
	10.1	Annual and Intermediate Surveys
	10.2	Complete Surveys
Section	11	Boilers
	11.1	Frequency of survey
	11.2	Scope of surveys
Section	12	Steam pipes
	12.1	Frequency of survey
	12.2	Scope of surveys

Section	13	Screwshafts, tube shafts and propellers
	13.1	Frequency of surveys
	13.2	Normal surveys
	13.3	Screwshaft Condition Monitoring (SCM)
	13.4	Modified Survey
	13.5	Partial Survey
Section	14	Hull planned maintenance, HPMS
	14.1	Introduction
	14.2	Master list items
	14.3	Scheme Approval
	14.4	Roles and Responsibilities
Section	15	Machinery planned maintenance and condition monitoring, MPMS, MCM and RCM
	15.1	Introduction
	15.2	Master list items
	15.3	The planned maintenance approach
	15.4	Basic requirements for approval of MPMS, MCM and RCM schemes
	15.5	Conditions of operation
	15.6	Breakdown or corrective maintenance

■ Section 1

1.1 Lloyd's Register (hereinafter referred to as 'LR'), which is recognised under the laws of the United Kingdom as a corporate body and a charity established for the benefit of the community, was founded in 1760. It was established for the purpose of producing a faithful and accurate classification of merchant shipping. It now primarily produces classification Rules.

1.2 Classification services are delivered to clients by a number of other members of the Lloyd's Register Group, including: Lloyd's Register EMEA, Lloyd's Register Asia, Lloyd's Register North America, Inc., and Lloyd's Register Central and South America Limited.

1.3 The Lloyd's Register Group (hereinafter referred to as 'the LR Group') comprises charities, other forms of organisation and non-charitable companies, with the latter supporting the charities in their main goal of enhancing the safety of life and property, at sea, on land and in the air, for the benefit of the public and the environment.

■ Section 2

2.1 LR remains the sole classification society in the LR Group. LR is managed by a Board of Trustees (hereinafter referred to as 'the Board').

The Board has:

appointed a Classification Committee and determined its powers and functions and authorised it to delegate certain of its powers to a Classification Executive and Devolved Classification Executives;
appointed Technical Committees and determined their powers, functions and duties.

2.2 The LR Group has established National and Area Committees in the following:

Countries:

Australia (via Lloyd's Register Asia)
Canada (via Lloyd's Register North America, Inc.)
China (via Lloyd's Register Asia)
Egypt (via Lloyd's Register EMEA)
Federal Republic of Germany
(via Lloyd's Register EMEA)
France (via Lloyd's Register EMEA)
Italy (via Lloyd's Register EMEA)
Japan (via Lloyd's Register)
New Zealand (via Lloyd's Register Asia)
Poland (via Lloyd's Register (Polska) Sp zoo)
Spain (via Lloyd's Register EMEA)
United States of America (via Lloyd's Register North America, Inc.)

Areas:

Benelux (via Lloyd's Register EMEA)
Central America (via Lloyd's Register Central and
South America Ltd)
Nordic Countries (via Lloyd's Register EMEA)
South Asia (via Lloyd's Register Asia)
Asian Shipowners (via Lloyd's Register Asia)
Greece (via Lloyd's Register EMEA)

General Regulations

Volume 1, Part 1, Chapter 1

Section 3

■ Section 3

3.1 LR's Technical Committee is at present composed of a maximum of 80 members which includes:

Ex officio members:

- Chairman and Chief Executive Officer of LR
- Chairman of the Classification Committee of LR

Members Nominated by:

- Technical Committee 2
- Royal Institution of Naval Architects 2
- Institution of Engineers and Shipbuilders in Scotland 2
- Institute of Marine, Engineering, Science and Technology 1
- Institute of Materials, Minerals and Mining 2
- Honourable Company of Master Mariners 1
- Institution of Engineering and Technology 1
- Institute of Refrigeration 1
- Welding Institute 2
- Shipbuilders' and Shiprepairers' Association 1
- The Society of Consulting Marine Engineers and Ship Surveyors 2
- Community of European Shipyards Associations 1
- Society of Maritime Industries 1
- European Marine Equipment Council 1
- Chamber of Shipping 1
- Greek Shipping Co-operation Committee 1
- International Association of Oil and Gas Producers 1

3.2 In addition to the foregoing:

- (a) Each National or Area Committee may appoint a representative to attend meetings of the Technical Committee.
- (b) A maximum of five representatives from National Administrations may be co-opted to serve on the Technical Committee. Representatives from National Administrations may also be elected as members of the Technical Committee under one of the categories identified in 3.1.
- (c) Further persons may be co-opted to serve on the Technical Committee by the Technical Committee.

3.3 All elections are subject to confirmation by the Board.

3.4 The function of the Technical Committee is to consider:

- (a) any technical issues connected with LR's marine business;
- (b) any proposed alterations in the existing Rules;
- (c) any new Rules for classification;

Where changes to the Rules are necessitated by mandatory implementation of International Conventions, Codes or Unified Requirements adopted by the International Association of Classification Societies these may be implemented by LR without consideration by the Technical Committee.

3.5 The term of office of the Chairman and of all members of the Technical Committee is five years. Members may be re-elected to serve an additional term of office with the approval of the Board. The term of office of the Chairman may be extended with the approval of the Board.

3.6 In the case of continuous non-attendance of a member, the Technical Committee may withdraw membership.

3.7 Meetings of the Technical Committee are convened as often and at such times and places as is necessary, but there is to be at least one meeting in each year. Urgent matters may be considered by the Technical Committee by correspondence.

3.8 Any proposal involving any alteration in, or addition to, Part 1, Chapter 1 of Rules for Classification is subject to approval of the Board. All other proposals for additions to or alterations to the Rules for Classification other than Part 1, Chapter 1, will following consideration and approval by the Technical Committee either at a meeting of the Technical Committee or by correspondence, be recommended to the Board for adoption.

3.9 The Technical Committee is empowered to:

- (a) appoint sub-Committees or panels; and
- (b) co-opt to the Technical Committee, or to its sub-Committees or panels, representatives of any organisation or industry or private individuals for the purpose of considering any particular problem.

General Regulations

Volume 1, Part 1, Chapter 1

Sections 4 & 5

■ Section 4

4.1 LR's Naval Ship Technical Committee is at present composed of a maximum of 50 members and includes:

Ex officio members

- Chairman and Chief Executive Officer of LR

Member nominated by:

- Naval Ship Technical Committee;
- The Royal Navy and the UK Ministry of Defence;
- UK Shipbuilders, Ship Repairers and Defence Industry;
- Overseas Navies, Governments and Governmental Agencies;
- Overseas Shipbuilders, Ship Repairers and Defence Industries;

4.2 All elections are subject to confirmation by the Board.

4.3 All members of the Naval Ship Technical Committee are to hold security clearance from their National Authority for the equivalent of NATO CONFIDENTIAL. All material is to be handled in accordance with NATO Regulations or, for non-NATO countries, an approved equivalent. No classified material shall be disclosed to any third party without the consent of the originator.

4.4 The term of office of the Naval Ship Technical Committee Chairman and of all members of the Naval Ship Technical Committee is five years. Members may be re-elected to serve an additional term of office with the approval of the Board. The term of the Chairman may be extended with the approval of the Board.

4.5 In the case of continuous non-attendance of a member, the Naval Ship Technical Committee may withdraw membership.

4.6 The function of the Naval Ship Technical Committee is to consider technical issues connected with Naval Ship matters and to approve proposals for new Naval Ship Rules, or amendments to existing Naval Ship Rules.

4.7 Meetings of the Naval Ship Technical Committee are convened as necessary but there will be at least one meeting per year. Urgent matters may be considered by the Naval Ship Technical Committee by correspondence.

4.8 Any proposal involving any alteration in, or addition to, Part 1, Chapter 1 of Rules for Classification of Naval Ships is subject to approval of the Board. All other proposals for additions to or alterations to the Rules for Classification of Naval Ships, other than Part 1, Chapter 1, will following consideration and approval by the Naval Ship Technical Committee, either at a meeting of the Naval Ship Technical Committee or by correspondence, be recommended to the Board for adoption.

4.9 The Naval Ship Technical Committee is empowered to:

- (a) appoint sub-Committees or panels; and
- (b) co-opt to the Naval Ship Technical Committee, or to its sub-Committees or panels, representatives of any organisation or industry or private individuals for the purpose of considering any particular problem.

■ Section 5

5.1 LR has the power to adopt, and publish as deemed necessary, Rules relating to classification and has (in relation thereto) provided the following:

- (a) Except in the case of a special directive by the Board, no new Regulation or alteration to any existing Regulation relating to classification or to class notations is to be applied to existing ships.
- (b) Except in the case of a special directive by the Board, or where changes necessitated by mandatory implementation of International Conventions, Codes or Unified Requirements adopted by the International Association of Classification Societies are concerned, no new Rule or alteration in any existing Rule is to be applied compulsorily after the date on which the contract between the ship builder and shipowner for construction of the ship has been signed, nor within six months of its adoption. The date of 'contract for construction' of a ship is the date on which the contract to build the ship is signed between the prospective shipowner and the ship builder. This date and the construction number (i.e. hull numbers) of all the vessels included in the contract are to be declared by the party applying for the assignment of class to a newbuilding. The date of 'contract for construction' of a series of sister ships, including specified optional ships for which the option is ultimately exercised, is the date on which the contract to build the series is signed between the prospective shipowner and the ship builder. In this section a 'series of sister ships' is a series of ships built to the same approved plans for classification purposes, under a single contract for construction. The optional ships will be considered part of the same series of sister ships if the option is exercised not later than 1 year after the contract to build the series was signed. If a contract for construction is later amended to include additional ships or additional options, the date of 'contract for construction' for such ships is the date

General Regulations

Volume 1, Part 1, Chapter 1

Sections 5 to 8

on which the amendment to the contract is signed between the prospective shipowner and the ship builder. The amendment to the contract is to be considered as a 'new contract'. If a contract for construction is amended to change the ship type, the date of 'contract for construction' of this modified vessel, or vessels, is the date on which the revised contract or new contract is signed between the Owner, or Owners, and the shipbuilder. Where it is desired to use existing approved ship or machinery plans for a new contract, written application is to be made to LR. Sister ships may have minor design alterations provided that such alterations do not affect matters related to classification.

- (c) All reports of survey are to be made by surveyors authorised by members of the LR Group to survey and report (hereinafter referred to as 'the Surveyors') according to the form prescribed, and submitted for the consideration of the Classification Committee.
- (d) Information contained in the reports of classification and statutory surveys will be made available to the relevant owner, National Administration, Port State Administration, P&I Club, hull underwriter and, if authorised in writing by that owner, to any other person or organisation.
- (e) Notwithstanding the general duty of confidentiality owed by LR to its client in accordance with the LR Rules, LR clients hereby accept that, LR will participate in the IACS Early Warning System which requires each IACS member to provide its fellow IACS members and Associates with relevant technical information on serious hull structural and engineering systems failures, as defined in the IACS Early Warning System (but not including any drawings relating to the ship which may be the specific property of another party), to enable such useful information to be shared and utilised to facilitate the proper working of the IACS Early Warning System LR will provide its client with written details of such information upon sending the same to IACS Members and Associates.
- (f) Information relating to the status of classification and statutory surveys and suspensions/withdrawals of class together with any associated conditions of class will be made available as required by applicable legislation or court order.
- (g) A Classification Executive consisting of senior members of LR's Classification Department staff shall carry out whatever duties that may be within the function of the Classification Committee that the Classification Committee assigns to it.

Section 6

6.1 No LR Group employee is permitted under any circumstances, to accept, directly or indirectly, from any person, firm or company, with whom the work of the employee brings the employee into contact, any present, bonus, entertainment or honorarium of any sort whatsoever which is of more than nominal value or which might be construed to exceed customary courtesy extended in accordance with accepted ethical business standards.

Section 7

7.1 LR has the power to withhold or, if already granted, to suspend or withdraw any ship from class (or to withhold any certificate or report in any other case), in the event of non-payment of any fee to any member of the LR Group.

Section 8

8.1 When providing services LR does not assess compliance with any standard other than the applicable LR Rules, international conventions and other standards agreed in writing.

8.2 In providing services, information or advice, the LR Group does not warrant the accuracy of any information or advice supplied. Except as set out herein, LR will not be liable for any loss, damage or expense sustained by any person and caused by any act, omission, error, negligence or strict liability of any of the LR Group or caused by any inaccuracy in any information or advice given in any way by or on behalf of the LR Group even if held to amount to a breach of warranty. Nevertheless, if the Client uses LR's services or relies on any information or advice given by or on behalf of the LR Group and as a result suffers loss, damage or expense that is proved to have been caused by any negligent act, omission or error of the LR Group or any negligent inaccuracy in information or advice given by or on behalf of the LR Group, then a member of the LR Group will pay compensation to the client for its proved loss up to but not exceeding the amount of the fee (if any) charged for that particular service, information or advice.

8.3 Notwithstanding the previous clause, the LR Group will not be liable for any loss of profit, loss of contract, loss of use or any indirect or consequential loss, damage or expense sustained by any person caused by any act, omission or error or caused by any inaccuracy in any information or advice given in any way by or on behalf of the LR Group even if held to amount to a breach of warranty.

8.4 Any dispute about LR's services is subject to the exclusive jurisdiction of the English courts and will be governed by English law.

■ Introduction

Definition of Hull Naval Class

Naval Ship Classification may be regarded as the development and worldwide implementation of published Rules and Regulations, which, in conjunction with proper care and conduct on the part of the Owner, will provide for:

1. the structural strength and the watertight integrity of all essential parts of the hull and its appendages; this includes compliance with a suitable damage stability standard accepted by LR;
2. the operation and functioning of associated systems installed for operational requirements relating to the ship type; and
3. the effectiveness of other defined features and systems which have been built into the ship in order to establish and maintain basic conditions on board whereby appropriate stores, fuels, equipment and personnel can be safely carried whilst the ship is at sea, at anchor, or moored in harbour.

A naval ship is said to be in Class when the Rules and Regulations which pertain to it have been complied with, or, compliance, equivalent to the Rules, has been ascertained.

LR maintains these provisions by way of periodical visits by its Surveyors to the ship as defined in the Regulations in order to ascertain that the vessel currently complies with those Rules and Regulations. Records of any defects found, or modifications carried out, between visits by LR surveyors, which may affect Classification, are to be maintained. Any defects found are to be reported to LR with the minimum of delay. The records will form the basis of remedial action, where necessary for maintenance of Class.

Military Distinctions

Military Distinction notations are awarded by LR as shown in Part 4 of these Rules. LR requires demonstration of the capability of the ship to withstand specified hostile military action without loss of capability. It is the responsibility of the navy or designer to specify and quantify the weapon performance and scenarios to be studied. A Military Distinction notation is awarded by LR on the basis that the assessment presented has been conducted in accordance with agreed procedures and the ship constructed in a manner that reflects the design requirements.

LR is to be informed of any incident of the ship sustaining damage. Such ships are to be made available for survey thereafter at the earliest possible opportunity.

Options

The handling of safety matters such as ship's stability, life saving appliances, pollution prevention arrangements and structural fire protection, fire detection and extinction arrangements is the prerogative of the Owner and his delegated Naval Authority. However, where these matters are delegated to LR they will be undertaken in accordance with agreed procedures and appropriate class notations will be assigned and entered into the *Register Book*.

Machinery Naval Class

Where agreed Naval Ship Classification will provide for the safety and reliability of propulsion, steering and other essential auxiliary engineering systems, including the arrangements for lifting appliances. When Machinery Naval Class is adopted, the aspects included in the definition of Hull Naval Class also apply.

Transfer of Information

To achieve naval class it is imperative to ensure that communication between LR, the Owner, Navy, Prime Contractor, Designer and Builder is effective. In designing, building and maintaining a ship to class it is essential that liaison between the various parties involved is assured. In particular, formal written contracts are essential for commercial reasons between the contractors, but an additional responsibility rests with all participants to ensure that naval class leads to a transparency of information during construction and thereafter.

■ Section 1

Conditions for Classification

1.1 Framework of Classification

1.1.1 The *Rules and Regulations for the Classification of Naval Ships* (hereinafter referred to as the Rules for Naval Ships), are applicable to those types of ship which are defined in 2.1.

Classification Regulations

Volume 1, Part 1, Chapter 2

Section 1

1.1.2 The Rules do not, unless stated or implied in the Class notation, provide for special distributions or concentrations of loading associated with the operation of the ship. LR may require additional strengthening to be fitted in any ship which may be subjected to severe stresses due to particular features in the design or operation, or where it is desired to make provision for exceptional loading conditions. In such cases particulars and details of the required loadings are to be submitted for consideration.

1.1.3 Compliance with the Rules does not relieve the designer of his responsibilities for compliance with the specification and the requirements for the overall design and in-service performance of the ship.

1.1.4 New ships built in accordance with the Rules, or in accordance with requirements equivalent thereto, will be assigned a Class and will continue to be classed so long as they are found, upon examination at the prescribed surveys, to be maintained in accordance with the requirements of the Rules.

1.1.5 In addition to confirming compliance with the Rules, LR will, in conjunction with the Naval Authority, require to be satisfied that the ship is suitable for the geographical or other limits or conditions of the service requested.

1.1.6 Preparations required to permit a ship with a service area restriction specifying some service limitation to undertake duties that take the ship beyond the specified service restriction, either from port of building to its service area or from one service area to another, are to be in accordance with arrangements agreed by LR prior to the voyage.

1.1.7 Any damage, defect, breakdown or grounding, which affect the conditions for which a Class has been assigned, must be reported to LR. (Note that some ships have a grounding condition included for Class).

1.1.8 Where LR is acting on behalf of the Naval Authority, any relevant requirements of the Naval Authority are to be identified and advised to LR in writing.

1.1.9 It is a requirement of classification that a suitable subdivision and stability standard, specified by the Naval Authority, is adopted and complied with. LR will provide advice on this aspect at the request of the Owner/Naval Authority. Where the Naval Authority, or its designated agency, approves the arrangements for compliance with the required stability and subdivision standards a copy of the following documentation is to be submitted:

- approval documentation issued by the Naval Authority stating that arrangements have been examined against the required standard and are acceptable.
- accepted arrangements of openings, closing appliances, vents, etc., such that the limits of the watertight integrity may be defined at the design draught. From these limits the pressure heads for watertight structure and watertight/weathertight closing requirements for openings, etc., can be identified.

Alternatively, Lloyd's Register (hereinafter referred to as 'LR') will approve the arrangements against the required standards.

1.1.10 It is a requirement of classification that fire safety arrangements are to comply with and be maintained in compliance with specified standard(s). The specified standard(s) and on-going certification regime are to be notified to LR by the Naval Authority in writing. LR will provide advice on this aspect at the request of the Owner/Naval Authority, see also 3.9 for the **FIRE** notation.

1.1.11 It is a requirement of classification that lifting appliance arrangements are to comply with and be maintained in compliance with specified standard(s). The specified standard(s) and on-going certification regime are to be notified to LR by the Naval Authority in writing. LR will provide advice on this aspect at the request of the Owner/Naval Authority, see also 3.9 for the **LAP** or **LA** notation.

1.1.12 It is a requirement of classification that magazine safety arrangements are to comply with and be maintained in compliance with specified standard(s). The specified standard(s) and on-going certification regime are to be notified to LR by the Naval Authority in writing. LR will provide advice on this aspect at the request of the Owner/Naval Authority.

1.1.13 Where an on board computer system having longitudinal strength capability, which is required by the Rules, is provided on a new ship, or newly installed on an existing ship, then the system is to be certified in respect of longitudinal strength in accordance with the document entitled *Approval of Longitudinal Strength and Stability Calculation Programs*, see also Pt 5, Ch 4.6.

1.2 Application

1.2.1 Except in the case of a special directive by LR no new Regulation or alteration to any existing Regulation relating to the character of Classification or to Class notations is to be applied to existing ships.

1.2.2 At the discretion of LR, ship types which are specifically covered by LR's *Rules and Regulations for the Classification of Ships* or other LR's Rules and Regulations for Classification may be considered for classification in accordance with these Rules and Regulations. See 9.1.1.

1.3 Interpretation of the Rules

1.3.1 The interpretation of the Rules is the sole responsibility, and at the sole discretion, of LR.

1.4 Owner's responsibilities

1.4.1 The Owner is to give LR Surveyors every facility and necessary access to carry out their survey duties. The Owner should familiarise himself with the relevant LR's Rules and, where appropriate, arrange that all sub-contractors, suppliers of components, materials or equipment do the same.

Classification Regulations

Volume 1, Part 1, Chapter 2

Sections 1 & 2

1.4.2 The survey procedures undertaken by LR when providing services are on the basis of periodical visits involving both monitoring and direct survey. LR's Surveyors may not be in continual attendance. As construction, outfitting and refitting are continuous processes, the Builder has the overall responsibility to his client to ensure and document that the requirements of the Rules, approved drawings and any agreed amendments made by the attending LR Surveyors, have been complied with.

1.4.3 Where the Navy/Owner identifies standards, conducts audits or issues certificates, and the responsibility has not been delegated to LR, LR is to be advised of the identity of the Naval Authority and is to be furnished with all appropriate standards and to have full access to the Naval Authority at all times.

1.5 Documentation

1.5.1 It is acknowledged that the Owner may wish to retain the originals of Certificates issued by LR, however, naval ships are required to carry the following documentation on board so that the attending Surveyor is able to carry out his duties (certified copies of Certificates are acceptable):

- (a) Endorsable Certificate of Class.
- (b) C11(N) – Record of watertight and weathertight closing arrangements.
- (c) Approved Stability information and damage control plan and the following as applicable.
- (d) Lifting Appliances Certificate.
- (e) Pollution record of equipment.
- (f) Tonnage Certificate.
- (g) Safety Equipment record of equipment.
- (h) Fire control plan.

1.6 Pre-Contract and Through-Life advice

1.6.1 LR will provide advice on the potential conditions of Classification for a naval ship, so that the Owner may specify design, construction and operation parameters that satisfy the requirements for Classification whilst being consistent with the intended application. A number of optional matters can be incorporated into the Conditions for Classification of the ship (see 3.9.9 to 3.9.12 and Ch 3.2.4). LR will also advise on Alterations and Additions and other matters which may affect the Conditions for Classification, and to liaise with the Owner on any other matter of concern for the purpose of assisting the Owner in establishing the parameters applicable to the ship's operational needs.

Section 2

Scope of the Rules

2.1 Applicable ship types

2.1.1 The Rules are applicable to naval ships designed and constructed for the purpose of carrying and operating naval systems. For the purposes of Classification, naval ships can be grouped into four categories as follows:

(a) NS1 ships

This category covers ships used for the deployment of aircraft or equipment and ships which may be used as centres of command. Designed for world wide operation and usually supported by ships from the NS2 category. Typically it will cover ships above 140 m in length with a deep displacement of 10000 tonnes or more. It will include aircraft carriers, helicopter and amphibious support ships, and assault ships.

(b) NS2 ships

This category covers ships used to defend NS1 ships as part of a task force or act as independent units. They may have a variety of sole or multiple roles including air defence, anti submarine, sea defence, shore support and will be designed for world wide operation.

Typically it will cover ships of length 70 m to 140 m with displacements of 1300 tonnes to 20000 tonnes. NS2 ships may be described as cruisers, frigates, destroyers, corvettes or similar.

(c) NS3 ships

This category covers ships that have a front line role but are not covered by the above descriptions. This category includes a variety of ships typically below 1500 tonnes displacement. They may operate independently or as part of a task force and are usually designed and constructed for specific roles such as mine sweeping, beach landings, coastal defence or fast patrol duties. A restricted service area may be specified.

(d) NSA ships

This category covers auxiliary naval ships used for the support of civil and naval operations. They may have a variety of roles including the movement of military and other personnel, ammunition, vehicles, stores and fuels and the transfer of such to other naval ships. They do not have a defined offensive role but may have a limited self-defence capability. In general, the ships will comply with LR's Rules for Ships and any relevant requirements in Ch 3,17 and satisfy as far as practicable the requirements of the International Conventions applicable to the ship type. Any deviation from the applicable International Convention requires agreement with the Navy or Naval Authority and where applicable the National Administration. A Design and Operating Scenario Statement declared by the Navy stating the role of the ship in terms of the carriage of equipment, personnel, stores and fuels is to be acceptable to LR. The assignment of the NSA ship type notation is dependent on the ship being in Machinery Naval Class with the ~~NS~~LMC, ~~NS~~ LMC, ~~NS~~ LMC or MCH notations.

There are special requirements for hovercraft, mine-sweepers, landing ships, which are to be designed in accordance with the appropriate sections of relevant LR's Rules and Regulations.

Classification Regulations

Volume 1, Part 1, Chapter 2

Sections 2 & 3

2.2 Definitions

For the purpose of the Rules and Class notations, the definitions given in 2.2.1 to 2.2.13 will apply.

2.2.1 Clear water. Water having sufficient depth to permit the normal development of wind generated waves.

2.2.2 Designer. The organisation which provides the design and constructional plans.

2.2.3 Fetch. The extent of clear water across which a wind has blown before reaching the ship.

2.2.4 Maximum speed. Maximum speed is the speed, in knots, achieved at the maximum continuous power for which the ship is certified in smooth water.

2.2.5 Mono-hull ship. A mono-hull ship is a ship whose single hull may be of displacement form or of a semi-planing or planing form subject to some support by hydrodynamic lift.

2.2.6 Naval Authority. An authority or authorities nominated by the Owner responsible for providing regulation associated with procurement and support of the ship. The Naval Authority may also be responsible for identifying appropriate standards, auditing and certification. The Naval Authority could be a Government department, Statutory Authority, LR or an independent organisation with appropriate standing.

2.2.7 Navy. The operator of the ship. The Navy may also be the Owner.

2.2.8 Owner. Generally, this will be the government department responsible for naval procurement and support. In certain circumstances, the Navy may operate ships chartered from other Owners, in which case the Owner as defined in these regulations is to be agreed with LR on a case by case basis.

2.2.9 Client. LR's point of contact with the organisation contracting it to undertake work.

2.2.10 Operational envelope. The operational envelope defines the ship's service in terms of operational speeds, wave heights, displacements, service area, temperatures, motions, flight deck operations and radar, and is to be provided by the Owner.

2.2.11 Reasonable weather. Reasonable weather is defined as wind strengths of force six or less on the Beaufort scale, associated with:

- (a) Sea states within the operational envelope which are sufficiently moderate to ensure that green water is taken on board at infrequent intervals only or not at all.
- (b) Motions such as do not impair the efficient operation of the ship.

2.2.12 Sheltered water. Water where the fetch is six nautical miles or less.

2.2.13 Stability information. Documents required for stability certification. The form of information is to be specified by the Naval Authority.

Section 3 Character of Classification and Class notations

3.1 General

3.1.1 This Section details the character symbols, Class notations which comprise the Class assigned to naval ships.

3.1.2 The character symbols identify whether the ship is built under LR Class and survey, the suitability for sea-going service, the provision of anchor handling equipment and the rules used for the construction of the ship. The character symbols are described in 3.2.

3.1.3 The Class notations detail the particular features of the ship which are required to be especially considered in order to verify where additional care has been taken in particular aspects of the design of the ship. These Class notations are subject to an approval process in order to satisfy Classification requirements.

3.1.4 Optional notations detail particular features of the ship which may not form part of the hull approval process required for Classification. Typically they include details of military design features, machinery and safety/environmental aspects of the vessel.

3.1.5 The following are examples of character symbols, and Class notations as they would appear in the *Register Book*:

- ⊗ 100A1 NS2 Frigate, SA1, AIR
- ⊗ LMC, SCM, SDA, ESA1, RSA2, Ice Class 1C
- ⊗ MD, SEA, EER.

3.2 Character symbols

3.2.1 All ships, when Classed, will be assigned a character of Classification comprising one or more character symbols as applicable, e.g. ⊗100A1.

3.2.2 A full list of character symbols for which a ship may be eligible is as follows:

- ⊗ This distinguishing mark will be assigned, at the time of Classing, to new ships constructed under Special Survey, in compliance with the Rules, and to the satisfaction of LR.
- 100 This character figure will be assigned to all ships considered suitable for sea-going service for Hull Naval Class.
- A This character letter will be assigned to all ships which have been built or accepted into Class in accordance with the Rules and Regulations, and which are maintained in good and efficient condition.

Classification Regulations

Volume 1, Part 1, Chapter 2

Section 3

- 1** This character figure will be assigned to:
- (a) Ships having on board, in good and efficient condition, anchoring and/or mooring equipment in accordance with the Rules.
 - (b) Ships Classified for a specific service, having on board, in good and efficient condition, anchoring and/or mooring equipment approved by the Committee as suitable and sufficient for the particular service.
- E** This character letter will be assigned to ships on which LR has agreed that anchoring and mooring equipment need not be fitted in view of their particular service.

3.2.3 For Classification purposes either the character figure **1** or the character letter **E** is to be assigned.

3.2.4 In cases where the anchoring and/or mooring equipment is found to be seriously deficient in quality or quantity, the Class of the ship will be liable to be withheld.

3.2.5 The Navy or Naval Authority may specify alternative or additional standards/requirements relating to the application of a character symbol or Class notation. Where these alternative or additional standards/requirements have been agreed by LR and a formal process for approval, construction, testing and verification throughout life has been established, this feature will be recognised by the addition of **(NS)** to a character symbol or Class notation. The alternative or additional requirements of the Navy or Naval Authority are to be clearly defined and referenced in the Classification Certificates and any required registers such as the register of lifting appliances. The following are examples of character symbols and Class notations that may recognise Navy or Naval Authority requirements as they may appear in the *Register Book*:

- A(NS)** Ship built or accepted into Naval Class in accordance with LR's Rules and Regulations for assignment of the **A** character and defined Navy or Naval Authority requirements.
- ⌘LMC(NS)** Propelling and essential auxiliary machinery constructed, installed and tested under Special Survey in accordance with LR's Rules and Regulations for assignment of **⌘LMC** Class notation and defined Navy or Naval Authority requirements.
- LA(NS)** Lifting appliances designed and built in accordance with LR's *Code for Lifting Appliances in a Marine Environment* (LAME) or equivalent standard for assignment of **LA** Class notation and additional defined requirements of the Navy or Naval Authority.
- FIRE(NS)** Fire protection functional requirements are in accordance with LR's requirements for assignment of **FIRE** Class notation and additional requirements of the Navy or Naval Authority.

3.2.6 Proposals to apply the additional Navy or Naval Authority recognition symbol **(NS)** to a character symbol or Class notation are to be made to LR with details of the Navy or Naval Authority requirements together with proposed processes for approval, construction, testing and verification throughout life.

3.3 Class notations

3.3.1 When considered necessary by LR, or when requested by an Owner and agreed by LR, a Class notation will be appended to the character of Classification assigned to the ship. The Class notation may consist of any of the following:

- (a) a ship type notation, see 3.4;
- (b) a service area notation, see 3.5;
- (c) a hull girder strength notation, see 3.6;
- (d) military distinction notations, see 3.7;
- (e) machinery and engineering systems notations, see 3.8;
- (f) other notations, see 3.9.

3.4 Ship type notations

3.4.1 The ship type notation will be recorded in the appropriate *Register Book* indicating the primary purpose for which the ship has been designed and constructed.

3.4.2 A list of ship type notations for which a ship may be eligible is:

- NS1** This notation will be assigned to NS1 category naval ships, as defined in Section 2.1.1(a).
- NS2** This notation will be assigned to NS2 category naval ships, as defined in Section 2.1.1(b).
- NS3** This notation will be assigned to NS3 category naval ships, as defined in Section 2.1.1(c).
- NSA** This notation will be assigned to NSA category naval ships, as defined in Section 2.1.1(d).

3.4.3 The ship type notation will be followed by a description which indicates the operational role for which the ship is designed and the hull form type, if of unusual form. The following are examples of the description of the ship's role:

Destroyer
Cruiser
Helicopter Carrier
Aircraft Carrier
Frigate
Corvette
Amphibious Assault Ship
Amphibious Transport Dock
Landing Craft
Landing Ship Dock
Minehunter
Minelayer
Mine-sweeper
Patrol ship
Fast Attack Craft
Fast Strike Craft
Fast Patrol Craft
Offshore Patrol Vessel.

Classification Regulations

Volume 1, Part 1, Chapter 2

Section 3

3.4.4 The **NSA** ship type notation will be followed by a description which indicates the operational role for which the ship is designed and operated. The following are examples of the description of an **NSA** ship's role:

- Replenishment Ship
- Oil Supply Ship
- Landing Ship Dock
- Survey Ship
- Stores Replenishment Ship
- Transport Dock
- Ro-Ro Ship
- Troop Carrier
- Vehicle Carrier
- Landing Craft
- Air Cushioned Support Vehicle.

3.4.5 **Design and Operating Scenario Statement:** This is required for **NSA** ships and is to detail the civil and naval support functions of the ship. The statement is to include but is not limited to the following:

- (a) Types and volumes of stores, equipment, fuels and ordnance to be carried on board.
- (b) The number of crew and embarked personnel to be carried on board.
- (c) International Conventions that will be applied to the ship; and any National Administration requirements that will be applied together with details of any exemptions that are being considered.
- (d) National Administration and their involvement in approval and operation in service.
- (e) Naval Ship Class notations that will be applied to the ship.
- (f) The Rules used for design and construction of the hull structure and machinery systems.
- (g) Proposed survey periodicity.
- (h) Installed combat systems.
- (j) Installed handling equipment for stores and equipment.
- (k) Design survivability of the ship.
- (l) Operational modes of the ship.

The statement is to be submitted at the time of submitting the Request for LR Services form and LR will advise acceptance of the contents of the statement before proceeding with detailed analysis of other plans and information required for classification purposes.

3.5 Service area notations

3.5.1 All ships classed under the Rules will be assigned a service area notation **SA** followed by a number or letter, e.g. **SA1**.

3.5.2 Service area notations listed below are available. The definitive extents of the service areas are shown in Fig. 2.2.2 in Pt 5, Ch 2 and Table 2.2.3 in Pt 5, Ch 2.

SA1 Service Area 1 covers ships having unrestricted world wide operation. **SA1** includes operation in all other service areas.

SA2 Service Area 2 is primarily intended to cover ships designed to operate in tropical and temperate regions. This service area excludes operating in sea areas for which a **SA1** notation is required.

SA3 Service Area 3 is primarily intended to cover ships designed to operate in tropical regions. This service area excludes operating in sea areas for which a **SA1** or **SA2** notation is required.

SA4 Service Area 4 covers ships designed to operate in Sheltered water, as defined in 2.2.12. This service area excludes operating in sea areas for which a **SA1**, **SA2** or **SA3** notation is required.

SAR Service Area Restricted covers ships that are designed to operate in a predetermined and contiguous area of operation.

3.5.3 More details of the service areas and extents are given in Pt 5, Ch 2.

3.6 Hull strength notations

3.6.1 The following notations are available for naval ships with regard to global hull girder strength aspects:

ESA1 Extreme Strength Assessment. This notation will be assigned if it has been demonstrated that the extreme hull girder strength meets the requirements of a specified performance level with calculations performed using a simple elastic type analysis.

ESA2 Extreme Strength Assessment. This notation will be assigned if it has been demonstrated that the extreme hull girder strength meets the requirements of a specified performance level with calculations performed using an elasto-plastic type analysis.

RSA1 Residual Strength Assessment. This notation will be assigned if it has been demonstrated that the residual hull girder strength after the ship has sustained structural damage meets the requirements of a specified performance level with calculations performed using a simple elastic type analysis.

RSA2 Residual Strength Assessment. This notation will be assigned if it has been demonstrated that the residual hull girder strength after the ship has sustained structural damage meets the requirements of a specified performance level with calculations performed using an elasto-plastic type analysis.

RSA3 Residual Strength Assessment. This notation will be assigned if it has been demonstrated that the residual hull girder strength after the ship has sustained structural damage meets the requirements of a specified performance level with calculations performed using a 3D non-linear finite element analysis.

TLA Total Load Assessment. This notation will be assigned if the scantlings have been verified using a total load approach.

SDA Structural Design Assessment. This notation will be assigned when direct calculations in accordance with agreed procedures have been applied.

FDA Fatigue Design Assessment. This notation will be assigned when an appraisal has been made of the fatigue performance of the structure in accordance with agreed procedures.

Classification Regulations

Volume 1, Part 1, Chapter 2

Section 3

3.7 Military Distinction notations

3.7.1 Military Distinction notations may be assigned if a particular feature relating to military loads has been incorporated in the design. The requirements for all the Military distinction notations are given in Part 4.

⊠ MD This military distinction notation will be assigned when military aspects of the ship have been constructed under LR's Special Survey and in accordance with LR's Rules and Regulations.

⊠ MD This military distinction notation will be assigned when military aspects of the ship have been constructed under LR's Special Survey in accordance with plans approved by the Naval Authority in accordance with Rules and Regulations equivalent to those of LR.

MD This military distinction notation will be assigned when military aspects of the ship have been assessed by the Naval Authority in accordance with the Rules and Regulations equivalent to those of LR.

In particular, the following confidential notations are available, and will be known only to the Owner and LR.

EB1 External air blast notation. This confidential notation indicates that the ship is capable of meeting the structural requirements to withstand an external blast compatible with a specified performance level using the rule loads and structural design methodology.

EB2 External air blast notation. This confidential notation indicates that the ship is capable of meeting the structural requirements to withstand an external blast compatible with a specified performance level using the rule loads and an elasto-plastic structural design methodology.

EB3 External air blast notation. This confidential notation indicates that the ship is capable of meeting the structural requirements to withstand an external blast compatible with a specified performance level using the rule loads and an finite element structural design methodology.

EB4 External air blast notation. This confidential notation indicates that the ship is capable of meeting the structural requirements to withstand an external blast compatible with a specified performance level using a full 3D non-linear code for the loads and/or structural design.

IB1 Internal air blast notation. This confidential notation indicates that the ship is capable of meeting the structural requirements to prevent the spread of an internal blast compatible with a specified performance level in accordance with rules requirements.

IB2 Internal air blast notation. This confidential notation indicates that the ship is capable of meeting the structural requirements to prevent the spread of an internal blast compatible with a specified performance level in accordance with rules requirements, supplemented by additional testing or analysis work.

FP1 Fragmentation protection notation. This confidential notation indicates that the ship is capable of meeting the local structural requirements to withstand a defined fragmentation threat compatible with a specified performance level using the rule structural requirements.

FP2 Fragmentation protection notation. This confidential notation indicates that the ship is capable of meeting the local structural requirements to withstand a defined fragmentation threat compatible with a specified performance level using fragmentation penetration algorithms.

SP Small arms protection. This confidential notation indicates that the ship is capable of meeting the local strengthening requirements to withstand an attack from a defined small arms threat compatible with a specified performance level.

SH1 Shock enhancement notation. This confidential notation indicates that the ship is capable of meeting the local structural requirements to withstand an underwater shock compatible with a specified performance level. The strength calculations are performed using a simplified approach.

SH2 Shock enhancement notation. This confidential notation indicates that the ship is capable of meeting the local structural requirements to withstand an underwater shock compatible with a specified performance level. The strength calculations are performed using a finite element modal in which the shock pulse is modelled using a suitable boundary element.

SH3 Shock enhancement notation. This confidential notation indicates that the ship is capable of meeting the local structural requirements to withstand an underwater shock compatible with a specified performance level. The strength calculations are performed using a hydrocode in which the shock pulse is modelled by attaching a volume of fluid to the structural model.

WH1 Whipping assessment notation. This confidential notation is known only to the Owner and indicates that the ship is capable of meeting the global structural requirements to withstand an underwater shock compatible with a specified performance level using a simple elastic type analysis.

WH2 Whipping assessment notation. This confidential notation is known only to the Owner and indicates that the ship is capable of meeting the global structural requirements to withstand an underwater shock compatible with a specified performance level using an elasto-plastic type analysis.

WH3 Whipping assessment notation. This confidential notation is known only to the Owner and indicates that the ship is capable of meeting the global structural requirements to withstand an underwater shock compatible with a specified performance level using a 3D non-linear finite element analysis.

NOTES

1. Star Endorsement (★) may be assigned to this notation where the arrangements on board are in accordance with stated National Administration requirements.
2. Double Star Endorsement (★★) may be assigned to this notation where the arrangements on board are in accordance with the requirements of ANEP-77 NATO *Naval Ship Code* (NSC).

ELS Quality of electrical power supplies		

Classification Regulations

Volume 1, Part 1, Chapter 2

Section 3

3.8 Machinery and Engineering Systems notations

3.8.1 The following class notations are associated with the machinery construction and arrangement, and may be assigned:

⊠ LMC This notation will be assigned when the propelling and essential auxiliary machinery has been constructed, installed and tested under Special Survey and in accordance with LR's Rules and Regulations.

⊡ LMC This notation will be assigned when the propelling and essential auxiliary machinery has been constructed under the survey of a recognised authority in accordance with the Rules and Regulations equivalent to those of LR. In addition the whole of the machinery will be required to have been installed and tested under Special Survey in accordance with LR's Rules and Regulations.

[⊠] LMC This notation will be assigned when the propelling arrangements, steering systems, pressure vessels and the electrical equipment for essential systems have been constructed, installed and tested under LR's Special Survey and are in accordance with LR's Rules for Naval Ships. Other items of machinery for propulsion and electrical power generation including propulsion gearing arrangements and other auxiliary machinery for essential services that are in compliance with LR's Rules and supplied with the manufacturer's certificate will be acceptable under this notation. The system arrangements of propelling and essential auxiliary machinery are required to be appraised by LR, and found to be acceptable to LR. See 3.10.2.

LMC This notation (without ⊠) will be assigned when the propelling and essential auxiliary machinery has neither been constructed nor installed under Special Survey, but the existing machinery, its installation and arrangement has been tested and found acceptable. This notation is assigned to existing ships in service accepted or transferring into LR class.

MCH This notation will be assigned when the propelling and essential auxiliary machinery has been installed and tested under LR's survey requirements and found to be acceptable to LR. Items of machinery and equipment for propelling and auxiliary machinery for essential services supplied with the manufacturer's certificate will be acceptable under this class notation. The system arrangements of propelling and essential auxiliary machinery are required to be appraised by LR, and found to be acceptable to LR. See 3.10.3.

SCM **Screwshaft Condition Monitoring.** This notation may be assigned when oil lubricated screwshaft arrangements with approved oil glands are fitted and the requirements of Ch 3,13.3 are complied with.

TCM **Turbine Condition Monitoring.** This notation will be assigned when the main propulsion steam turbines are provided with approved vibration monitoring equipment and the requirements of Ch 3,8.2 are complied with.

PMR This notation will be assigned where the main propulsion systems are arranged such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems. It also denotes that the installation has been arranged, installed and tested in accordance with LR's Rules.

PMR* This notation will be assigned where the main propulsion systems are arranged such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and where the machinery is installed in separate compartments such that, in the event of the loss of one compartment, the ship will retain availability of propulsion power. It also denotes that the installation has been arranged, installed and tested in accordance with LR's Rules.

SMR This notation will be assigned where the steering systems for manoeuvring are arranged so that steering capability will continue to be available in the event of a single failure in the steering gear equipment or loss of power supply or control system for any steering system. It also denotes that the installation has been arranged, installed and tested in accordance with LR's Rules.

SMR* This notation will be assigned where the steering systems for manoeuvring are arranged so that steering capability will continue to be available in the event of a single failure in the steering gear equipment or loss of power supply or control system for any steering system and where the steering systems are installed in separate compartments such that, in the event of the loss of one compartment, steering capability will continue to be available. It also denotes that the installation has been arranged, installed and tested in accordance with LR's Rules.

PSMR This notation will be assigned where the main propulsion and steering systems are configured such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and retain steering capability. It also denotes that the installation has been arranged, installed and tested in accordance with LR's Rules.

PSMR* This notation will be assigned where the main propulsion and steering systems are configured such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and retain steering capability. The propulsion and steering arrangements are to be installed in separate compartments such that in the event of the loss of one compartment, the ship will retain availability of propulsion power and manoeuvring capability. It also denotes that the installation has been arranged, installed and tested in accordance with LR's Rules.

Classification Regulations

Volume 1, Part 1, Chapter 2

Section 3

L	This character will be added to the PMR , SMR , PSMR and * notations to indicate a limited capability.	RAS(BV)	This notation will be assigned where a vessel has replenishment at sea systems that enable operations abeam and VERTREP. It also denotes that the installation and arrangements are in accordance with LR's Rules.
ELS	This notation will be assigned where both the quality and integrity of on board electrical power supplies meet the requirements of a relevant and acceptable Naval Standard, such as NATO Standardization Agreement (STANAG) 1008. It also denotes that the installation has been arranged, installed and tested in accordance with LR Rules.	RAS(A)	This notation will be assigned where a vessel has replenishment at sea systems that enable operations astern only. It also denotes that the installation and arrangements are in accordance with LR's Rules.
AG1	This notation will be assigned where the design of gearing for propulsion and/or auxiliary purposes has used enhanced analysis methods to provide detailed knowledge of the reliability of the gear elements and where noise excitation is required to be minimised for anticipated service conditions.	RAS(V)	This notation will be assigned where a vessel has replenishment at sea systems that enable operations VERTREP only. It also denotes that the installation and arrangements are in accordance with LR's Rules.
AG2	This notation will be assigned where the design of gearing for propulsion and/or auxiliary purposes has in addition to the requirements for AG1, used three dimensional finite element analysis for determining the flexibility of the geometry of the mating gears.	RAS(B)	This notation will be assigned where a vessel has replenishment at sea systems that enable operations abeam only. It also denotes that the arrangements are in accordance with LR's Rules.
AP1	This notation will be assigned to fast ships and craft where the propellers require an enhanced assessment of the manufacturing tolerances to control cavitation and noise characteristics.	(NT)	This notation will be assigned in addition to a RAS() notation where a vessel complies with NATO replenishment at sea requirements.
AP2	This notation will be assigned where ships have propellers that are required to have reduced noise characteristics and have had an enhanced assessment of the manufacturing tolerances.	PRM	This notation may be assigned when the provision refrigeration machinery and systems have been arranged, installed and tested in accordance with LR's Rules.
MPMS	This notation will be assigned where the machinery installation has an approved planned maintenance scheme that incorporates preventive maintenance procedures and the requirements of Ch 3,15 are complied with.	3.8.2	The following class notations are associated with the machinery control and automation, and may be assigned:
MCM	This notation will be assigned where an approved planned maintenance scheme for machinery incorporates condition monitoring techniques that are acceptable to LR and the requirements of Ch 3,15 are complied with.	UMS	This notation may be assigned when the arrangements are such that the ship can be operated with the Machinery Spaces Unattended. It denotes that the control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.
RCM	This notation will be assigned where an approved planned maintenance scheme for machinery incorporates a reliability centred maintenance analysis that is acceptable to LR and the requirements of Ch 3,15 are complied with.	CCS	This notation may be assigned when the arrangements are such that the machinery may be operated with continuous supervision from a Centralised Control Station. It denotes that the control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.
RAS(ABV)	This notation will be assigned where a vessel has replenishment at sea systems that enable operations astern, abeam and VERTREP. It also denotes that the installation and arrangements are in accordance with LR's Rules.	ICC	This notation may be assigned when the arrangements are such that the control and supervision of the ship operational functions are computer based. It denotes that the control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.
RAS(AB)	This notation will be assigned where a vessel has replenishment at sea systems that enable operations abeam and astern only. It also denotes that the installation and arrangements are in accordance with LR's Rules.	IP	This notation may be assigned to a ship classed with LR when the arrangements of the machinery are such that the propulsion equipment and all the essential auxiliary machinery is integrated with the power unit for operation under all normal sea-going and manoeuvring conditions. The system is to be bridge controlled and the propulsion equipment is to incorporate an emergency means of propulsion in the event of failure in the prime mover. It also denotes that the machinery and control equipment have been arranged, installed and tested in accordance with LR's Rules.
RAS(AV)	This notation will be assigned where a vessel has replenishment at sea systems that enable operations astern and VERTREP. It also denotes that the installation and arrangements are in accordance with LR's Rules.		

Classification Regulations

Volume 1, Part 1, Chapter 2

Section 3

3.8.3 The following class notations are associated with dynamic positioning arrangements, and may be assigned:

DP(CM) This notation may be assigned when a ship is fitted with centralised remote manual controls for position keeping and with position reference system(s) and environmental sensor(s). It denotes that the control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

DP(AM) This notation may be assigned when a ship is fitted with automatic main and manual standby controls for position keeping and with position reference system(s) and environmental sensor(s). It denotes that the machinery and control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

DP(AA) This notation may be assigned when a ship is fitted with automatic main and automatic standby controls for position keeping and with position reference system(s) and environmental sensor(s). It denotes that the machinery and control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

DP(AAA) This notation may be assigned when a ship is fitted with automatic main and automatic standby controls for position keeping together with an additional/emergency automatic control unit located in a separate compartment and with position reference systems and environmental sensors. It denotes that the machinery and control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

PCR The class notation will be supplemented with a Performance Capability Rating (PCR). This rating indicates the calculated percentage of time that a ship is capable of holding heading and position under a standard set of environmental conditions (North Sea).

3.8.4 The following class notations are associated with navigation safety, and may be assigned:

NAV1 This notation will be assigned when the bridge layout and level of equipment are such that the ship is considered suitable for safe periodic operation under the supervision of a single watchkeeper on the bridge. It denotes that the navigational installation has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

IBS This notation will be assigned where an integrated bridge system is fitted to provide electronic chart display, track planning and automatic track following, centralised navigation information display, and bridge alarm management. It denotes that the integrated bridge system has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto. For assignment of this notation, in addition to satisfying LR Rules, or equivalent thereto, for navigational function integration:

- (a) the layout of the bridge and the equipment located on the bridge is to satisfy the requirements of a relevant Naval, International or National ergonomic or human-centred design standard, or an acceptable equivalent, to the satisfaction of LR; or

- (b) the notation **NAV1** is also to be assigned; or
- (c) where the bridge is not intended to operate a periodic one man watch, the layout of the bridge and the equipment on the bridge are to satisfy the requirements for the assignment of the notation **NAV1** to the satisfaction of LR with the exception of requirements identified by LR Rules that may be relaxed in such cases.

3.8.5 Machinery and Engineering Systems class notations will not be assigned to ships where the hulls are not classed or intended to be classed with LR.

3.8.6 Other class notations may be assigned where the machinery and engineering systems are in accordance with the requirements of the additional features included in Volume 3 of the Rules.

3.9 Other notations

3.9.1 Mandatory operational notation.

AIR Mandatory notation for ships that operate aircraft in accordance with the requirements of Pt 4, Ch 2,10 for the landing, manoeuvring and parking areas.

3.9.2 **LA.** This special feature Class notation is mandatory where the vessel has fitted onboard lifting appliances which are considered by LR to be essential for it to fulfil its primary operational role (e.g. Aircraft lifts on aircraft carriers, Landing platform dock stern ramp) and that there are no alternative means of operation. The lifting appliance is to be designed, built and surveyed in accordance with LR's *Code for Lifting Appliances in a Marine Environment* (LAME).

3.9.3 **LAP.** This optional special feature Class notation will be assigned to the ship in respect of the lifting appliances fitted which are designed and built in accordance with LR's *Code for Lifting Appliances in a Marine Environment* (LAME) or equivalent standard, but where it is not mandated by the LA notation, see 3.9.2. This notation will be assigned in association with a register of lifting appliances listing the appliances covered. The register, which is to be attached to the Classification Certificate, is the responsibility of the designer/Owner and should include the following lifting appliances, where fitted as appropriate:

- (a) Bow, side and stern doors serving as ramps and/or serve to provide watertight integrity of the ship.
- (b) Vehicle ramps.
- (c) Movable decks.
- (d) Stores lifts and munitions lifts.
- (e) Cranes.
- (f) Davits.
- (g) Replenishment at sea positions.
- (h) Engineers lifting positions.
- (i) Eye plates and securing devices.
- (k) Miscellaneous lifting positions.
- (l) Towed body attachments.

The notation will be retained so long as the appliances are found upon examination by LR at the prescribed surveys to be maintained in accordance with the standard.

Classification Regulations

Volume 1, Part 1, Chapter 2

Section 3

3.9.4 LI Loading Instrument. This notation will be assigned where an approved loading instrument has been installed either as a Class or Owner's requirement.

3.9.5 CM Construction Monitoring complements the **SDA** and **FDA** notations and will be assigned when the controls in construction tolerances have been applied and verified.

3.9.6 SEA(HSS-n), SEA(VDR), SEA(VDR-n) Ship Event Analysis. At the Owner's request, and in order to enhance safety and awareness onboard during ship operation, provisions can be made for a hull surveillance system that monitors the hull girder stresses and motions of the ship and warns the ship's personnel that these levels or the frequency and magnitude of slamming motions are approaching a level where corrective action is advisable. The extension -n signifies the number of fitted strain gauges if connected to the system. The following option extensions will be added to the notation:

- L** The display and recording of the relevant strength information.
- M** The display and recording of the ship's motion.
- N** The facility to display and record navigational information.
- VDR** An interface with the ships voyage data recorder system to enable the recording of hull stress, ship motion and hull pressure information.

3.9.7 ES Enhanced Scantlings. Available where scantlings in excess of the approved Rule minimum requirements are fitted at defined locations. For example, the note **ES+1** will indicate that an extra 1 mm has been fitted to the hull envelope plating (i.e. deck, side and bottom).

3.9.8 SERS Ship Emergency Response Service. This service, offered by LR provides a rapid computer assisted analysis of a damaged ship's stability and damaged longitudinal strength in the event of a casualty to the ship. Where an Owner adopts this service, the notation **SERS**, 'Ship is registered with LR's Ship Emergency Response Service' is available.

3.9.9 EER Escape, Emergency Access, Evacuation and Rescue. This notation will be assigned to naval ships which demonstrate compliance with all the requirements for **FIRE**, **ESC** and **LSAE** notations. It also denotes that the systems and their arrangements have been integrated in such a manner so as to support safe and effective task performance.

3.9.10 FIRE Fire Protection. This notation will be assigned to naval ships which are shown to have levels of fire protection that incorporate the functional requirements and objectives of the applicable IMO International Conventions or *ANEP-77 NATO Naval Ship Code* (NSC) and that have been accepted by LR in accordance with LR's Rules.

3.9.11 ESC Escape and Emergency Access. This notation will be assigned to naval ships which demonstrate levels of personnel safety in the event of a 'prepare to evacuate' situation and emergency access arrangements that incorporate the functional requirements and objectives of the applicable IMO International Convention or *ANEP-77 NATO Naval Ship Code* (NSC) and that have been accepted by LR

in accordance with LR's Rules. Where the requirements of the NSC are to be applied for an **ESC ★★** notation, the **LSAE★★** notation must also be applied.

3.9.12 LSAE Life-saving and Evacuation Arrangements. This notation will be assigned to naval ships which demonstrate the provision of life-saving and rescue equipment on board that incorporates the functional requirements and objectives of the applicable IMO International Conventions or *ANEP-77 NATO Naval Ship Code* (NSC) and that have been accepted by LR in accordance with LR's Rules. Where the requirements of the NSC are to be applied for an **LSAE★★** notation, the **ESC★★** notation must also be applied.

3.9.13 SNC Safety of Navigation and Communication. This notation will be assigned to naval ships which demonstrate levels of safety of navigation and communication arrangements on board that incorporate the functional requirements and objective of the applicable IMO International Conventions and that have been accepted by LR in accordance with LR's Rules.

3.9.14 POL Pollution Prevention. This notation will be assigned to naval ships which demonstrate that the pollution prevention arrangements on board that incorporate the functional requirements and objectives of the applicable IMO International Conventions and that have been accepted by LR in accordance with LR's Rules.

3.9.15 Ice Class notation. An appropriate class notation for navigation in ice may be assigned when the hull structural and machinery installation are such that the ship may be operated in defined ice conditions, see below. The notation denotes that the hull structural arrangements and machinery installation have been designed, constructed, installed and tested in accordance with LR's Rules or its equivalent thereto. The Class notations available are described below:

- (a) **Ice Class 1AS.** This strengthening is for ships intended to navigate in first year ice conditions equivalent to unbroken level ice with a thickness of 1,0 m.
- (b) **Ice Class 1A.** This strengthening is for ships intended to navigate in first year ice conditions equivalent to unbroken level ice with a thickness of 0,8 m.
- (c) **Ice Class 1B.** This strengthening is for ships intended to navigate in first year ice conditions equivalent to unbroken level ice with a thickness of 0,6 m.
- (d) **Ice Class 1C.** This strengthening is for ships intended to navigate in first year ice conditions equivalent to unbroken level ice with a thickness of 0,4 m.

If operation in first year is defined by the operational requirement as an emergency feature then special consideration will be given to the use of fully plastic design criteria for the shell plating. In such cases the ice class notation will be annotated with *.

3.9.16 LMA. This notation will be assigned where the ship's manoeuvring capability has been assessed in conjunction with engine and propulsion performance. It denotes that the manoeuvring performance has been verified through trials in accordance with LR's Rules.

Classification Regulations

Volume 1, Part 1, Chapter 2

Section 3

3.9.17 CEPAC. This notation will be assigned where the noise and vibration levels in crew and embarked personnel spaces have been assessed and meet acceptance criteria for comfort. It denotes that the noise and vibration levels have been measured and reported in accordance with LR's Rules. Numerals **1** or **2** following the **CEPAC** notation indicate the acceptance criteria to which the noise and vibration levels have been assessed.

3.9.18 EP. This notation will be assigned where the environmental protection arrangements for prevention of pollution of the sea and of the air demonstrate compliance with the Rules. Supplementary characters **A** Anti-fouling coatings, **B** Ballast water management, **F** Protected fuel tanks, **G** Grey water, **N** Oxides of nitrogen in exhaust emissions, **R** Refrigeration systems, **S** Oxides of sulphur in exhaust emissions and **O** Oily bilge water reflect compliance with additional requirements.

3.9.19 EP. This notation will be assigned when the environmental protection arrangements are in accordance with the requirements of another recognised classification society and are broadly equivalent to the LR Environmental Protection Rule requirements. Prior to assignment of the notation, an audit, in accordance with the requirements in Vol 3, Pt 2, Ch 2.4.1.3 and 4.1.4 of the Rules, is to be undertaken by LR to confirm that the necessary Environmental Protection procedures are in place and implemented effectively.

3.9.20 HPMS. This notation will be assigned where the hull structure has an approved planned maintenance scheme that incorporates maintenance and inspections by authorised ship's staff and the requirements of Ch 3,14 are complied with.

3.9.21 SD Special Duties Notation. A special duties notation will be recorded in the *Register Book* indicating that the ship has been designed, modified or arranged for special duties other than those implied by the type notation. Ships with special duties notations are not thereby prevented from performing any other duties for which they may be suitable.

3.9.22 PCWBT Protective Coating in Water Ballast Tanks. This notation will be assigned to indicate that the ship's water ballast tanks are coated and that the coating remains efficient and well maintained.

3.9.23 *IWS. This notation (In-water Survey) may be assigned to a ship where the applicable LR requirements are complied with, see Section 7 and Ch 3,4.3.

3.10 Application notes

3.10.1 Propelling and essential auxiliary machinery includes machinery, equipment and systems installed for the ship to be under seagoing conditions and that are necessary for the following:

- (a) Maintaining the watertight and weathertight integrity of the hull and spaces within the hull.
- (b) The safety of the ship, machinery and personnel on board.

- (c) The functioning and dependability of propulsion, steering, electrical, ship type and support systems.
- (d) The operation and functioning of control engineering systems for the monitoring and safety of propulsion, steering, ship type and support systems.
- (e) The operation and functioning of emergency machinery and equipment.
- (f) The operation and functioning of machinery and equipment for harbour use and that can also be used while the vessel is at sea.

3.10.2 Manufacturer's certificate for assignment of the **[X]LMC** notation. Acceptance of the manufacturer's certificate for items of machinery for propulsion (including propulsion gearing with single input/output arrangements) and for electrical power generation and for other auxiliary machinery for essential services is subject to the following:

- (a) The vessel is an NS3 ship or an NSA ship of less than 500 gross tonnage or is a ship of 500 gross tonnage or greater and is not required to comply with international conventions applicable to a ship with unrestricted service.
- (b) Propulsion power is provided by oil engines or gas turbines which have been type approved to LR's requirements for marine application.
- (c) Electrical power is provided by generators driven by oil engines or gas turbines which have been type approved to LR's requirements for marine application.
- (d) The design and manufacture standards for all machinery and associated systems are the applicable LR's Rules.
- (e) The machinery and equipment is manufactured under a recognised quality control system.
- (f) Propellers, propulsion shafting and multiple input/output gearboxes are not included within the scope of propulsion arrangements for acceptance of a manufacturer's certificate.

See Section 6.

3.10.3 Manufacturer's certificate for assignment of the **MCH** notation. Acceptance of the manufacturer's certificate for propelling and essential auxiliary machinery is subject to the following:

- (a) The ship is an NS3 ship or an NSA ship of less than 500 gross tonnage or is a ship of 500 gross tonnage or greater and is not required to comply with international conventions applicable to a ship with unrestricted service.
- (b) Propulsion power is provided by oil engines or gas turbines which have been type approved to LR's requirements for marine application.
- (c) Electrical power is provided by generators driven by oil engines or gas turbines which have been type approved to LR's requirements for marine application.
- (d) The power of any engine or gas turbine is less than 2,250 kW and the cylinder bore of any diesel engine is not greater than 300 mm.
- (e) The design standards for machinery and associated systems are the applicable LR's Rules or other marine standards acceptable to LR.
- (f) The machinery and equipment is manufactured under a recognised quality control system.

See Section 6.

Classification Regulations

Volume 1, Part 1, Chapter 2

Sections 3 & 4

3.10.4 **Gross tonnage** of a vessel is to be determined for the purposes of these Rules, by the following formula:

$$GT = K_1 V$$

where:

V = total volume of all enclosed spaces in the vessel in cubic metres and includes gun turrets, radar domes, masts, etc.

$$K_1 = 0,2 + 0,02 \log_{10} V.$$

Section 4 Surveys – General

4.1 New construction

Plan Appraisal

4.1.1 When it is intended to build a ship for Classification with LR, constructional plans and all particulars relevant to the hull, equipment and machinery, as detailed in the Rules, are to be submitted for the approval of LR before the work is commenced. Critical Areas (see Ch 3,1.5.3) will be identified at this stage. Any additional plans submitted will not be subject to appraisal or approval without separate agreement. Any subsequent modifications or additions to the scantlings, arrangements or equipment shown on the approved plans are also to be submitted for approval, under separate arrangements.

4.1.2 Where the proposed construction of any part of the hull or machinery is of novel design, or involves the use of unusual material, or where experience has not sufficiently justified the principle or mode of application involved, special tests or examinations before and during service may be required. In such cases a suitable notation may be entered in the *Register Book*.

4.1.3 The materials used in the construction of hulls and machinery intended for Classification are to be of good quality and free from defects and are to comply with the requirements of the Rules. Material is to be manufactured by works approved by LR. Alternatively, tests to the satisfaction of LR will be required to demonstrate the suitability of the material.

4.1.4 Copies of the latest approved plans, essential certificates and records, required loading and other instruction manuals are to be readily available for use when required by LR's Surveyors and are thereafter required to be kept on board.

4.1.5 If requested LR will check intact and damage stability calculations and approve the Stability information in accordance with a standard acceptable to the Naval Authority and LR.

4.1.6 **Fire Protection – FIRE.** The arrangements for fire protection, detection and extinction are to be examined to ensure that the following fire protection objectives have been satisfied:

- (a) **Fire Prevention Objective.** The ship is to be designed and equipped so as to reduce the risk of the occurrence of fire or explosion, taking due account of its operational role.
- (b) **Fire Detection Objective.** The ship is to be designed and equipped, as far as is practicable, to detect any potentially hazardous fire or explosion.
- (c) **Fire Extinguishing Objective.** The ship is to be equipped, so far as is practicable, so that all detected fires can be safely and effectively extinguished.
- (d) **Containment Objective.** The ship is to be arranged, so far as is practicable, to limit the spread of fire, smoke and toxic by-products to the space of origin.
- (e) **Personnel Hazard Objective.** All reasonable measures are to be taken to prevent hazards to personnel as a result of fire.
- (f) **System Interaction Objective.** The possibility of fire protection measures or systems causing fire related, or non-fire related hazards is to be kept to a level that is as low as is reasonably practicable.
- (g) **Command and Control Objective.** Suitable means are to be provided to ensure any active fire control measures can be safely and effectively orchestrated.
- (h) **Structural Integrity Objective.** Sufficient structural integrity is to be maintained following a fire so as to prevent the whole or partial collapse of the ship's structures due to strength deterioration by heat.

4.1.7 Pollution Prevention – POL (Optional)

The arrangements for prevention of pollution of the sea and air from the ship are to be examined to ensure that the following MARPOL Regulations have been complied with:

- (a) MARPOL Annex I (Prevention of Pollution by Oil)
- (b) MARPOL Annex V (Prevention of Pollution by Garbage)
- (c) MARPOL Annex IV (Prevention of Pollution by Sewage)
- (d) MARPOL Annex VI (Prevention of Air Pollution)

4.1.8 Life-Saving and Evacuation – LSAE

The arrangements for life-saving and evacuation are to be examined to ensure that the following life-saving and evacuation objectives have been satisfied:

- (a) **Evacuation Objective.** Arrangements are to be provided to enable personnel to evacuate the ship safely and in a time acceptable to the Naval Authority.
- (b) **Personnel Protection Objective.** Evacuated personnel are to be kept protected until such time as they can be rescued from the survival craft.
- (c) **Rescue Objective.** The ship is to be suitably equipped to rescue personnel from the water.
- (d) **Command and Control Objective.** The ship is to be equipped and manned so that command of all evacuation and life-saving situations can be maintained.

4.1.9 Escape and Emergency Access – ESC

The arrangements for escape and emergency access are to be examined to ensure the following escape of personnel and emergency access objectives have been satisfied:

- (a) **Escape of Personnel Objective.** The ship is to be arranged so that all spaces have means of safe and effective escape for personnel to a designated place of safety, during reasonably foreseeable emergency situations.

Classification Regulations

Volume 1, Part 1, Chapter 2

Section 4

- (b) **Emergency Access Objective.** The ship is to be arranged so that personnel can access all areas with necessary equipment, for damage control and fire-fighting purposes and exercises.

4.1.10 Safety of Navigation and Communications – SNC. The arrangements for the safety of navigation and communications are to be examined to ensure the following safety of navigation and communication objectives have been satisfied:

- (a) **Communication Objective.** The ship is to be capable of communication to avert unnecessary danger to itself and other ships in the vicinity during normal and emergency conditions.
- (b) **Safety of Navigation Objective.** The ship is to be arranged with the necessary equipment to facilitate safe and effective navigation.
- (c) **Equipment Arrangements Objective.** All navigation and communications equipment is to be arranged to allow safe and effective task performance.

4.1.11 Escape, Emergency Access, Evacuation and Rescue – ERR. The arrangements for the integration of the requirements for compliance with the **FIRE, ESC** and **LSAE** notations are to be examined to ensure that the arrangements support safe and effective task performance.

4.2 Survey

4.2.1 The Surveyor is to be satisfied that the capability, organisation and facilities of the Builder are such that acceptable standards can be obtained for the construction of the ship and machinery.

4.2.2 In addition to 4.1.3, the hull construction of ships is to be controlled by a documented quality control system covering the Builder's management, organisation and relevant construction processes and inspection procedures.

4.2.3 New ships intended for Classification are to be built under Naval Class Special Survey. The Surveyors are to be satisfied that the materials, workmanship and arrangements are in accordance with the Rules. Any items found not to be in accordance with the Rules or the approved plans, or any material, workmanship or arrangements found so to be, are to be rectified or concession sought from LR.

4.2.4 For compliance with 4.2.3 LR will consider methods of survey and inspection for hull construction which formally include procedures involving the shipyard management, organisation and quality systems.

4.2.5 The Surveyor will prepare a report C11(N) record of hull and superstructure watertight, weathertight arrangements and closing appliances.

4.2.6 The date of completion of the Special Survey during construction of ships built under LR's supervision will normally be taken as the date of build to be entered in the *Register Book*. If the period between launching and commissioning is, for any reason, unduly prolonged, the dates of launching and completion or commissioning may be separately indicated in the *Register Book*.

4.2.7 When a ship, upon completion, is not immediately commissioned but is laid-up for a period, LR, upon application by the Owner, prior to the ship proceeding to sea, will direct an examination to be made by LR's Surveyors which may include a survey in dry-dock. If, as the result of such survey, the hull and machinery is reported in all respects free from deterioration, in compliance with the Rules, the subsequent Special Survey will date from the time of such examination.

4.3 Existing ships

4.3.1 Classification of ships not built under LR survey. The requirements of LR for the Classification of ships which have not been built under LR's Survey are indicated in Ch 3,16. Special consideration will be given to ships that have been designed, constructed and maintained to appropriate standards recognised by the Naval Authority, and to ships transferring Class to LR from another recognised Classification Society who have appropriate Naval Ship Rules.

4.3.2 Classification of ships built under survey to Classification Rules and Regulations other than LR Naval Ship Rules and Regulations. The requirements of LR for the Classification of ships and craft which have not been built under LR's Survey to LR's Rules are indicated in Ch 3,17.

4.3.3 Reclassification. When reclassification or Class reinstatement is desired for a ship for which the Class previously assigned by LR has been withdrawn or suspended, LR will direct that a survey, appropriate to the age of the ship and the circumstances of the case, be carried out by LR's Surveyors. If, at such survey, the ship be found or placed in a good and efficient condition in accordance with the Rules and Regulations, LR will be prepared to consider reinstatement of the original Class or the assignment of such other Class as may be deemed necessary. The date of any reclassification will be recorded in the Supplement to the *Register Book*. When the original classification was not to the Rules for Naval Ships, then it will be necessary to demonstrate compliance with the additional requirements of these Rules.

4.3.4 LR reserves the right to decline an application for Classification or reclassification where the prior history or condition of the ship indicates this to be appropriate.

4.4 Damages, repairs and alterations

4.4.1 All repairs to hull, equipment and machinery which may be required in order that a ship may retain Class, see 1.1.7, are to be carried out to the satisfaction of LR's Surveyors. When repairs are effected at a location where the services of a Surveyor to LR are not available, the repairs are to be surveyed by LR Surveyors at the earliest opportunity thereafter.

Classification Regulations

Volume 1, Part 1, Chapter 2

Section 4

4.4.2 Any damage in association with wastage over the allowable limit (including buckling, grooving, detachment or fracture), or extensive areas of wastage over the allowable limits, which affects or, in the opinion of the Surveyor, will affect the ship's structural, watertight or weathertight integrity, is to be promptly and thoroughly repaired. Areas to be considered include, (where fitted):

- side shell frames, their end attachments or adjacent shell plating;
- deck structure and deck plating;
- bottom structure and bottom plating;
- side structure and side plating;
- inner bottom structure and inner bottom plating;
- inner side structure and inner side plating;
- watertight or oiltight bulkheads;
- hatch covers or hatch coamings.

For locations where adequate repair facilities are not available, consideration may be given to allow the ship to proceed directly to a repair facility. This may require discharging stores/equipment and/or temporary repairs for the intended voyage.

4.4.3 When at any survey the Surveyor considers repairs to be immediately necessary, either as a result of damage, or wear and tear, they are to communicate their recommendations at once to the Owner, or his representative. When such recommendations are not complied with, immediate notification is to be given to LR's London Office by the Surveyor.

4.4.4 When at any survey it is found that any damage, defect, or breakdown (see 1.1.7) is of such a nature that it does not require immediate permanent repair, but is sufficiently serious to require rectification by a prescribed date in order to maintain Class, a suitable Condition of Class is to be imposed by the Surveyors and recommended for consideration. This condition may be designated as an operational defect, under the Owner's control, but LR needs to be kept advised as to proposed actions. The technical impact of any deficiency on the operational needs of the ship must be considered by the surveyor in liaison with the Owner/Naval Authority before a decision is made with regard to corrective action.

4.4.5 If a ship which is Classed with LR is to leave harbour limits or protected waters under tow, the Owner is to advise LR of the circumstances prior to her departure.

4.4.6 If a ship which is Classed with LR is taken in tow whilst at sea, the Owner is to advise LR of the circumstances at the first practicable opportunity.

4.4.7 Plans and particulars of any proposed alterations (Mods. or A's and A's) to the approved scantlings and arrangements of the hull, machinery and engineering systems are to be submitted by the Owners or Builders or their representatives for approval by LR and such alterations are to be carried out to the satisfaction of LR's Surveyors.

4.5 Existing ships – Periodical Surveys

4.5.1 **Annual Surveys** are to be held on all ships within three months, before or after each anniversary of the completion, commissioning or Special Survey. The date of the last Annual Survey will be recorded in the Supplement to the *Register Book*. This survey may include optional requirements.

4.5.2 **Intermediate Surveys** are to be held on all ships instead of the third or fourth Annual Survey after completion, commissioning or Special Survey. The date of the last Intermediate Survey will be recorded in the Supplement to the *Register Book*.

4.5.3 The Owner should notify LR whenever a ship can be examined in dry-dock or on a slipway. An inspection of the underwater hull and its appendages is to be carried out not less than twice every six years. The maximum period between inspections of the hull and its appendages in dock or in-water is not to exceed three and a half years. Consideration may be given at the discretion of LR to any special circumstances justifying an extension of the maximum periods between inspections. A **Docking Survey** is to be carried out concurrently with the Special Survey. The required Docking Survey is considered to coincide with the Special Survey when held within the six months prior to the due date of the Special Survey. See 4.5.5.

4.5.4 The date of the last Docking Survey will be recorded in the Supplement to the *Register Book*.

4.5.5 Classification details and Survey requirements for **In-water Surveys** are given in Section 7 and Ch 3,4.3 respectively. An In-water Survey can be carried out in lieu of a Docking Survey for inspection of the underwater hull and appendages between the Docking Surveys that are to be carried out concurrently with the Special Survey. The date of the last In-water Survey will be recorded in the Supplement to the *Register Book*, preceded with the notation ***IWS**.

4.5.6 All ships classed with LR are also to be subjected to **Special Surveys**. These Surveys become due at six-yearly intervals, the first one six years from the date of build or date of Special Survey for Classification as recorded in the *Register Book*, and thereafter six years from the date recorded in the Supplement to the *Register Book* for the previous Special Survey. Consideration can be given, at the discretion of LR, to any exceptional circumstances justifying an extension of hull Classification beyond the sixth year. If an extension is agreed the next period of hull Classification will start from the due date of the Special Survey before the extension was granted.

4.5.7 Special surveys may be commenced at the fifth Annual Survey or anniversary, as appropriate, after completion, commissioning, or previous Special Survey, and be progressed during the succeeding year with a view to completion by the due date of the Special Survey.

4.5.8 Special Surveys which are commenced prior to their due date are not to extend over a period greater than twelve months, except with the prior approval of LR.

Classification Regulations

Volume 1, Part 1, Chapter 2

Section 4

4.5.9 Ships which have satisfactorily passed a Special Survey will have a record entered in the Supplement to the *Register Book* indicating the date. Where the Special Survey is completed more than three months before the due date, the new record of Special Survey will be the final date of survey. In all other cases the date recorded will be the sixth anniversary.

4.5.10 At the request of an Owner, LR may agree that the Special Survey of the hull be carried out on the Continuous Survey basis, all compartments of the hull being opened for survey and testing, in rotation, with an interval of six years between consecutive examinations of each part. In general, approximately one sixth of the Special Survey is to be completed each year and all the requirements of the particular hull Special Survey must be completed at the end of the six-year cycle. Ships which have satisfactorily completed the cycle will have a record entered in the Supplement to the *Register Book* indicating the date of completion which will not be later than six years from the last assigned date of Complete Survey of the hull.

4.5.11 If any examination during Continuous Survey reveals defects, further parts are to be opened up and examined as considered necessary by the Surveyor, and the defects are to be made good to his satisfaction.

4.5.12 Alternative arrangements for survey periodicity will be considered by LR upon request. Requests from the Owner, at build or during service, need to be supported by adequate evidence of satisfactory performance before survey periodicity can be changed. These requests could be based upon Reliability Centred Maintenance or other forms of condition monitoring.

4.5.13 Machinery is to be submitted to the surveys detailed in Ch 3,7 to 13.

4.5.14 Complete Surveys of machinery become due at six-yearly intervals, the first one six years from the date of build or date of first classification as recorded in the *Register Book*, and thereafter six years from the date recorded in the Supplement to the *Register Book* for the previous Complete Survey. Consideration can be given at the discretion of LR to any exceptional circumstances justifying an extension of machinery class to a maximum of three months beyond the sixth year. If an extension is agreed to, the next period of machinery class will start from the due date of Complete Survey of machinery before extension was granted. Surveys which are commenced prior to their due date are not to extend over a period greater than 12 months, except with the prior approval of LR. On satisfactory completion of a survey, an appropriate record will be made in the Supplement to the *Register Book*. Where the complete survey is completed more than three months before the due date, the new date recorded will be the final date of survey. In all other cases the date recorded will be the sixth anniversary. See also 4.5.20.

4.5.15 Upon application by an Owner, LR may agree to the extension of the survey requirements for main propulsion machinery, which, by the nature of the ship's normal service, do not attain the number of running hours recommended by the machinery manufacturer for major overhauls within the survey periods given in 4.5.14.

4.5.16 When, at the request of an Owner, it has been agreed by LR that the Complete Survey of the machinery may be carried out on the Continuous Survey basis, the various items of machinery are to be opened for survey in rotation, so far as is practicable, to ensure that the interval between consecutive examinations of each item will not exceed six years. In general, approximately one-sixth of the machinery is to be examined each year. A record indicating the date of satisfactory completion of the Continuous Survey cycle will be made in the Supplement to the *Register Book*. See also 4.5.20.

4.5.17 Upon application by an Owner, LR may agree to an arrangement whereby, subject to certain conditions, some items of machinery may be examined by the qualified naval engineering personnel responsible to the Marine Engineer Officer of the ship, followed by a limited confirmatory survey and annual audit of maintenance and repairs records. Particulars of this arrangement may be obtained from LR's London Office. Where an approved planned maintenance scheme is in operation the confirmatory surveys of machinery may be held at annual intervals, at which time the records will be checked and the operation of the scheme verified. Particulars of this arrangement may also be obtained from LR's London Office.

4.5.18 Where condition monitoring techniques are applied, LR, upon application by the Owner, will be prepared to amend applicable Periodical Survey requirements where details of the equipment are submitted and found satisfactory. Where machinery installations are accepted for this method of survey, it will be a requirement that an Annual Survey be held, at which time monitored records will be analysed and the machinery examined under working conditions. An acceptable lubricating oil trend analysis programme may be required as part of the condition monitoring procedures.

4.5.19 Where machinery installations include a 'lifed item' (an item of machinery, component or equipment necessary for the safety and reliability of propulsion, steering or other essential auxiliary engineering system) which is subject to an overhaul and/or ultimate life limitation, i.e. a period (expressed in operating hours or cycles and/or calendar time) at which the item is to be overhauled or scrapped, the life limitations are to be observed and take precedence over the periodicity of 4.5.14 and 4.5.16 where the life limitation is less than the survey periodicity. Examples may include rolling bearing elements, gas turbines, turbo-chargers, flexible couplings and gear box elements. The manufacturer's maintenance and service instructions are to be strictly observed. Where machinery installations include a 'lifed item' details will be noted in the classification records as a Memorandum (Machinery) record.

4.5.20 Where propulsion and auxiliary machinery is maintained using an approved 'upkeep by exchange' system, the Marine Engineer Officer is to maintain records of all exchanges carried out. At the first convenient opportunity after exchange, a running test on load is to be witnessed by a LR Surveyor (this may typically be the time of Annual Survey). Where prime movers are maintained by an 'upkeep of exchange' system, details will be noted in the classification records as a Memorandum (Machinery) record.

Classification Regulations

Volume 1, Part 1, Chapter 2

Section 4

4.5.21 Boiler surveys, examination of steam pipes and Screwshaft Surveys are to be carried out as stated in Pt 1, Ch 3, 11 and 12 of these Regulations. On satisfactory completion, appropriate records will be made in the Supplement to the *Register Book*.

4.5.22 Where the ship is fitted with a dynamic positioning system, the system is to be examined and tested annually in accordance with the requirements of Ch 3, 2.3.15. In addition a Special Survey is to be carried out at intervals not exceeding five years in accordance with Ch 3, 7.2.9.

4.6 Certificates

4.6.1 When survey reports have been received from the Surveyors and approved by LR, a Certificate of First Entry of Classification, signed by the Chairman, or the Deputy Chairman and Chairman of the Sub-Committee of Classification, will be issued to the Builders or Owners.

4.6.2 A Certificate of Class valid indefinitely subject to endorsement for Annual and Intermediate Surveys, as appropriate, will also be issued to the Owners and a certified copy placed on board. A new certificate will be issued when no further endorsement spaces remain.

4.6.3 LR's Surveyors will issue provisional (interim) certificates, after survey, to enable a ship classed with LR to proceed on voyage provided that it is in a satisfactory condition. Such certificates will embody the Surveyors' recommendations for continuance of Class, and are subject to confirmation by LR.

4.7 Notice of surveys

4.7.1 It is the responsibility of the Owners to ensure that all surveys necessary for the maintenance of Class are carried out at the proper time.

4.7.2 Timely notice to an Owner about forthcoming surveys is available by means of access to LR's ClassDirect Live. The omission of such notice, however, does not absolve the Owner from their responsibility to comply with LR's survey requirements.

4.7.3 The Owner will give timely notice of the availability of ships for survey. Should a ship not be available at the due time, the agreement for postponement of the survey should be sought from LR.

4.8 Withdrawal/Suspension of Class

4.8.1 When the Class of a ship, for which the Regulations as regards surveys on the hull, equipment and machinery have been complied with, is withdrawn by LR in consequence of a request from the Owner, the notation 'Class withdrawn at Owner's request' (with date) will be assigned.

4.8.2 When the Regulations as regards surveys on the hull equipment and machinery have not been complied with and the ship is thereby not entitled to retain Class, the Class will be suspended or withdrawn after consultation with the Owner and a corresponding notation will be assigned. In order to maintain Class, LR will require documentary evidence regarding the material state of the ship, its systems and equipment in terms of reports, photographs, measures or videos where the operational requirements exceed 12 months.

4.8.3 LR will consider requirements from the Owner to continue Class where operational requirements curtail surveys being held.

4.8.4 When in accordance with 4.4.3 and 4.4.4 a Condition of Class is imposed, this will be assigned a due date for completion and the ship's Class will be subject to a suspension procedure if the condition of Class is not dealt with, or postponed by agreement, by the due date.

4.8.5 When it is found, from the reported condition of the hull or equipment or machinery of a ship, that an Owner has failed to comply with paragraphs 1.1.7, 4.4.1 or 4.4.6, the Class will be liable to be suspended or withdrawn, at the discretion of LR, and a corresponding notation assigned.

4.8.6 When any ship proceeds to sea with a design draught greater than that approved, the Class will be liable to be withdrawn or suspended for the voyage.

4.8.7 In all instances of Class withdrawal or suspension, the assigned notation, with date of application, will initially appear in the Supplement to the *Register Book* and subsequently in the *Register Book*. In cases where Class has been suspended by LR and it becomes apparent that the Owners are no longer interested in retaining LR's Class, the notation will be amended to withdrawn status. After Class withdrawn status has been established in the *Register Book* for one year, it will be automatically amended to 'Classed LR until' (with date).

4.8.8 For reclassification and reinstatement of Class, see 4.3.2 and 4.3.3.

4.9 Survey of ships out of commission

4.9.1 The Classification requirements for laid up vessels will be specially considered. Surveys for continuation of Class may be required at the request of the Owners and the discretion of LR.

4.10 Appeal from Surveyor's recommendation

4.10.1 If the recommendations of LR's Surveyors are considered in any case to be unnecessary or unreasonable, appeal may be made to LR, who may direct a Special Examination to be held.

■ Section 5 Type Approval/Type Testing/ Quality Control System

5.1 LR Type Approval

5.1.1 LR Type Approval is an impartial certification system that provides independent third-party Type Approval Certificates attesting to a product's conformity with specific standards or specifications. It is based on design review and type testing or where testing is not appropriate, a design analysis.

5.1.2 The LR Type Approval System is a process whereby a product is assessed in accordance with a specification, standard or code to check that it meets the stated requirements and through selective testing demonstrates compliance with specific performance requirements. The testing is carried out on a prototype or randomly selected product(s) which are representative of the manufactured product under approval. Thereafter, the producer is required to use Quality Assurance procedures and processes to ensure that each item delivered is in conformity with that which has been Type Approved.

5.1.3 The selective testing required by 5.1.2 is to include environmental testing applicable to the product's installation on board a ship classed or intended to be classed with LR.

5.1.4 LR Type Approval does not remove the requirements for inspection and survey procedures required by the Rules for equipment to be installed in ships classed or intended to be classed with LR. Also, LR Type Approval does not remove the requirement for plan appraisal of a system that incorporates Type Approved equipment where required by the Rules.

5.1.5 LR Type Approval is subject to the understanding that the producer's recommendations and instructions for the product and any relevant requirements of the Rules for the Classification of Naval Ships are fulfilled.

5.1.6 The producer supplying equipment or components under Quality Control procedures and processes is to have a recognised quality management system certified by an IACS member or a Notified Body. The Quality Control procedures and processes are to address the production of the product consistent with 5.3.

5.1.7 Where equipment or components have been Type Approved in accordance with specifications and procedures other than LR's, details of the product, certification and testing are to be submitted for consideration where appropriate.

5.2 Type testing

5.2.1 Type testing is an impartial process that provides independent third-party verification that an item of machinery or equipment has satisfactorily undergone a functional type test.

5.2.2 Type testing is carried out against defined performance and test standards for a defined period of time with test conditions varying between minimum and maximum declared design conditions.

5.2.3 Type testing is carried out on a prototype or randomly selected product(s) which are representative of the manufactured product under assessment.

5.2.4 After type testing, mechanical equipment is to be opened out and inspected for damage or excessive wear.

5.2.5 On application from the manufacturer, type tests may be waived for equipment and machinery that has been proven to be reliable in marine service and where compliance with the current applicable standards can be demonstrated. Equipment and machinery that has been previously type tested with satisfactory testing evidence and certification need not have the type tests repeated where previous testing is in compliance with the current testing standards for the equipment.

5.2.6 The acceptance of type testing certification is subject to the understanding that the manufacturer's recommendations and instructions for the product and any relevant requirements of the applicable Rules are fulfilled.

5.3 Quality Control System

5.3.1 A quality control system for the purposes of LR acceptance of materials and machinery refers to a scheme that covers the operational techniques and activities that are used to demonstrate that the quality requirements of a product is in accordance with declared standards.

5.3.2 The quality control system for a particular product extends to all parties involved in the supply chain from manufacture and testing through to delivery of the product.

5.3.3 LR acceptance of machinery and equipment manufactured under a quality control scheme is dependent on the scheme being maintained through a traceable process involving planned audits and spot inspections at the discretion of LR Surveyors. The purpose of the audits and spot inspections is to ensure that the procedures for manufacture and quality control are being maintained in a satisfactory manner.

5.3.4 The use of a quality control system does not remove the requirements for inspection processes that may be required by the Rules applicable to the equipment being supplied with a manufacturer's certificate. Also the use of the quality control system does not remove the requirement for plan appraisal of equipment or systems where required by the Rules.

Classification Regulations

Volume 1, Part 1, Chapter 2

Sections 6, 7, 8 & 9

■ Section 6 Classification of machinery with [X]LMC or MCH notation

6.1 General

6.1.1 After delivery of machinery and equipment with the manufacturer's certificate to the shipyard, Survey at the Shipyard and Periodical Surveys are to be in accordance with the requirements for ships built or accepted into Class with the [X]LMC notation.

6.2 Appraisal and records

6.2.1 To facilitate survey and compilation of classification records, the same plans and information that are required for a ship being accepted into class with the [X]LMC notation, are required to be submitted for the alternative notation [X] LMC or MCH for appraisal and information. Plans are not required where machinery and equipment has previously been type approved, in these cases it is only necessary to submit details of the machinery and equipment together with details of the previous approval.

6.3 Survey and inspection

6.3.1 The manufacturer's certificate for acceptance of machinery and equipment for assignment of the [X]LMC or MCH notation is to be in the English language and include the following information:

- Design and manufacturing standard(s) used.
- Materials used for construction of key components and their sources.
- Details of the quality control system applied during design, manufacture and testing and of any software maintenance.
- Details of any type approval or type testing.
- Details of installation and testing recommendations for the machinery or equipment.

The manufacturer is to have a recognised quality management system certified by an IACS member or a Notified Body.

6.3.2 The installation and testing of machinery and equipment at the build or fitting-out yard that has been supplied with a manufacturer's certificate is to be in accordance with the requirements applicable to a ship having the [X]LMC notation.

■ Section 7 Classification of ship with *IWS notation

7.1 General

7.1.1 Where the *IWS class notation for In-water Survey is requested, application should be made to the Committee in writing with evidence of the Owner's agreement.

7.1.2 Where the *IWS notation is to be assigned, protection of the underwater portion of the hull is to be provided by means of a suitable high resistant paint applied in accordance with the manufacturer's requirements.

7.2 Appraisal and records

7.2.1 To facilitate survey and compilation of classification records, the following plans and particulars are to be submitted to LR for appraisal and information:

- Details of how the rudder pintle and bush clearances are to be measured and how the security of the pintles in their sockets are to be verified with the ship afloat.
- Details showing how stern bush clearances are to be measured with the ship afloat.
- Details of high resistant paint, for information only.

7.2.2 Where the *IWS notation is assigned, approved plans and particulars covering the items detailed in 7.2.1 are to be placed on board.

■ Section 8 Classification of ship with operational role: Oil Supply Ship

8.1 General

8.1.1 Where the Oil Supply Ship description is to be assigned, the requirements in the *Rules and Regulations for the Classification of Ships* relating to oil tankers are to be complied with.

■ Section 9 Classification of naval ships using alternative LR's Rules

9.1 General

9.1.1 Where it is proposed to class a naval ship with materials of construction and operating parameters not addressed within the scope of the Naval Ship Rules then the appropriate elements of other LR Classification Rules may be used where agreed between the Naval Authority, the Navy, Builder and LR.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Section 1

Section

1	General
2	Annual Surveys – Hull, machinery and optional requirements
3	Intermediate Surveys – Hull and machinery requirements
4	Docking Surveys and In-water Surveys
5	Special Survey – Hull requirements
6	Special Survey – Thickness measurement requirements for steel ships
7	Machinery survey – General requirements
8	Turbines – Detailed requirements
9	Oil engines – Detailed requirements
10	Electrical equipment
11	Boilers
12	Steam pipes
13	Screwshafts, tube shafts and propellers
14	Hull planned maintenance, HPMS
15	Machinery planned maintenance and condition monitoring, MPMS, MCM and RCM
16	Classification of ships not built under LR survey
17	Classification of ships built under survey to LR Classification Rules and Regulations other than LR Naval Ship Rules and Regulations

■ Section 1 General

1.1 Frequency of surveys

1.1.1 The requirements of this Chapter are applicable to the Periodical Surveys set out in Ch 2,4.5. Except as amended at the discretion of the Committee, the periods between such surveys are as follows:

- (a) Annual Surveys – annually within three months of the anniversary date.
- (b) Intermediate Surveys – in place of the third or fourth Annual Survey.
- (c) Docking Surveys – at six-yearly intervals concurrent with Special Survey, and in lieu of In-water Survey.
- (d) In-water Surveys – concurrent with the Intermediate Survey.

- (e) Special Surveys at six-yearly intervals.
For alternative arrangements, see also Ch 2,4.5.10, 4.5.11, 4.5.12 and 1.1.2.
- (f) Complete Surveys of machinery of six yearly intervals, see Ch 2,4.5.14.

1.1.2 When it has been agreed that the complete survey of the hull and machinery may be carried out on the Continuous Survey basis, all compartments of the hull and all items of machinery are to be opened for survey in rotation to ensure that the interval between consecutive examinations of each part will not exceed six years (see Ch 2,4.5.10 and 4.5.11).

1.1.3 For the frequency of surveys of machinery, boilers, steam pipes, screwshafts, tube shafts and propellers, see Sections 7 to 13.

1.2 Surveys for damage or alterations

1.2.1 At any time when a ship is undergoing alterations or damage repairs, any exposed parts of the structure normally difficult of access are to be specially examined, e.g. if any part of the main or auxiliary machinery, including boilers, or fittings is removed for any reason, the hull structure in way is to be carefully examined, or when cement in the bottom, permanent ballast or sheathing on decks is removed, the structure in way is to be examined before replacement.

1.2.2 This examination should normally be carried out by a Surveyor, and the Owners/Naval Authority should give as much notice as possible to LR so that arrangements can be made for attendance. In the absence of a Surveyor, due to the unforeseen nature of the removal, the Owner is to carry out a suitable examination and report the findings to LR as soon as practicable.

1.3 Unscheduled surveys

1.3.1 In the event that LR has cause to believe that its Rules and Regulations are not being complied with, LR reserves the right to perform unscheduled surveys.

1.3.2 In the event of significant damage or defect affecting any ship, LR reserves the right to perform unscheduled surveys of the hull of other similar ships classed by LR and deemed to be vulnerable.

1.3.3 A requirement to perform an unscheduled survey will be subject to the agreement of the Owner and operational needs.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Section 1

1.4 Documentation

1.4.1 The Owner may wish to retain the originals of certificates issued by LR, however, Naval ships are required to carry the following documentation on board so that the attending Surveyor is able to carry out his duties (certified copies of certificates are acceptable):

- (a) Endorsable Certificate of Class.
- (b) C11(N) – Record of watertight and weathertight closing arrangements.
- (c) Approved Stability information and damage control plan, and the following as applicable.
- (d) Lifting Appliances Certificate.
- (e) Pollution record of equipment.
- (f) Tonnage Certificate.
- (g) Safety Equipment Certificate and associated report.
- (h) Fire control plan.

1.5 Definitions

1.5.1 **Spaces** are all separate compartments within the hull and superstructure including plated masts. Integral tanks are considered to be separate spaces.

1.5.2 **Representative Spaces** are those which may be expected to reflect the condition of other spaces of similar type and service and with similar corrosion prevention systems. When selecting representative spaces account should be taken of the service and repair history onboard and identifiable critical areas.

1.5.3 **Critical Areas** are locations which are known to be vulnerable to corrosion, buckling and/or fatigue cracking. These will be identified at the plan approval stage.

1.5.4 **Suspect Areas** are locations within the hull structure vulnerable to increased likelihood of structural deterioration and may include:

- (a) For steel hulls, areas of corrosion and/or fatigue cracking.
- (b) For aluminium alloy hulls, areas of fatigue cracking and areas in the vicinity of bimetallic connections.
- (c) For composite hulls, areas subject to impact damage.
- (d) For high speed ships, areas of the bottom structure forward prone to slamming damage.

1.5.5 For ships designed to the *Rules and Regulations for the Classification of Ships*, **Substantial Corrosion** is defined as wastage of individual plates and stiffeners in excess of 75 per cent of allowable margins, but within acceptable limits.

1.5.6 For ships designed on a net scantling basis (using for example the *Rules and Regulations for the Classification of Naval Ships* (hereinafter referred to as the Rules for Naval Ships)) **Substantial Corrosion** is defined as the wastage of individual plates and stiffeners in excess of the net scantlings, less an allowance for rolling, but within corrosion limits that are applicable for the structure concerned.

1.5.7 **Excessive Corrosion** is wastage in excess of acceptable limits that are applicable for the structure concerned.

1.5.8 **Protective Coatings** for steel ships should usually be hard coatings. Other coating systems (e.g. soft coating) may be considered acceptable as alternatives provided they are applied and properly maintained in compliance with the manufacturer's specification.

1.5.9 Coating conditions for steel ships are defined as follows:

GOOD condition with only minor spot rusting affecting not more than 20 per cent of areas under consideration.

FAIR condition with local breakdown at edges of stiffeners and weld connections and/or light rusting affecting 20 per cent or more of areas under consideration.

POOR condition with general breakdown of coating affecting 20 per cent or more of areas under consideration or hard scale affecting 10 per cent or more of the area under consideration.

1.5.10 A **Deep Tank** is a tank that extends upwards from the ship's bottom or inner bottom to or higher than the lowest deck.

1.5.11 A **Ballast Tank** is a tank which is solely used for salt-water ballast. A space which is used for purposes other than salt-water ballast but may also be used for salt-water ballast will be treated as a salt-water ballast tank when substantial corrosion has been found.

1.6 Preparation for survey and means of access

1.6.1 Tanks and spaces are to be safe for access, i.e. gas freed, ventilated and illuminated.

1.6.2 In preparation for survey, thickness measurements and to allow for a thorough examination, all spaces are to be cleaned including removal from surfaces of all loose accumulated corrosion scale. Spaces are to be sufficiently clean and free from water, scale, dirt, oil residues, etc. to reveal corrosion, deformation, fractures, damages or other structural deterioration. However, those areas of structure whose renewal has already been decided by the owner need only be cleaned and de-scaled to the extent necessary to determine the limits of renewed areas.

1.6.3 Sufficient illumination is to be provided.

1.6.4 Means are to be provided to enable the Surveyor to examine the structure in a safe and practical way.

1.6.5 For surveys, including close-up survey where applicable, in cargo spaces and ballast tanks, one or more of the following means of access, is to be provided:

- (a) Permanent staging and passages through structures.
- (b) Temporary staging and passages through structures.
- (c) Lifts and movable platforms.
- (d) Boats or rafts.
- (e) Other equivalent means.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Section 1

1.6.6 Survey at sea or anchorage may be undertaken when the Surveyor is fully satisfied with the necessary assistance from the personnel onboard and provided the following conditions and limitations are met:

- (a) Surveys of tanks by means of boats or rafts is at the sole discretion of the attending Surveyor, who is to take into account the safety arrangements provided, including weather forecasting and ship response in reasonable sea conditions. Appropriate life jackets are to be available for all participants. The boats or rafts are to have satisfactory residual buoyancy and stability even if one chamber is ruptured. A safety checklist is also to be provided. An oxygen-meter, breathing apparatus, lifeline and whistles are to be at hand during the survey. For oil supply ships an explosimeter is also to be provided.
- (b) A communication system is to be arranged between the survey party in the tank and the responsible officer on deck. This system must include the personnel in charge of ballast pump handling if boats or rafts are to be used.
- (c) Surveys of tanks by means of boats or rafts will only be permitted for the under deck areas of tanks when the coating of the under deck structure is in GOOD condition and there is no evidence of wastage. The only exception to this, at the discretion of the Surveyor, is where the depth of under deck web plating is 1,5 m or less. Alternatively, rafting may be used if a permanent means of access is provided in each bay to allow safe entry and exit. This means of access is to be direct from deck via a vertical ladder and a small platform fitted approximately 2 m below deck. Where these conditions are not met, then the under deck area will require to be staged for survey.

1.7 Repairs

1.7.1 Any damage in association with wastage over the allowable limit (including buckling, grooving, detachment or fracture), or extensive areas of wastage over the allowable limits, which affects or, in the opinion of the Surveyor, will affect the ship's structural, watertight or weathertight integrity, is to be promptly and thoroughly repaired. Areas to be considered include, (where fitted):

- (a) Side shell frames, their end attachments or adjacent shell plating;
- (b) deck structure and deck plating;
- (c) bottom structure and bottom plating;
- (d) side structure and side plating;
- (e) inner bottom structure and inner bottom plating;
- (f) inner side structure and inner side plating;
- (g) watertight or oiltight bulkheads;
- (h) hatch covers or hatch coamings.

For locations where adequate repair facilities are not available, consideration may be given to allow the ship to proceed directly to a repair facility. This may require discharging the cargo and/or temporary repairs for the intended voyage.

1.7.2 Additionally, when a survey results in the identification of substantial corrosion or structural defects, either of which, in the opinion of the Surveyor, will impair the ship's fitness for continued service, remedial measures are to be implemented before the ship continues in service.

1.8 Thickness measurement at surveys

1.8.1 This Section is applicable to the thickness measurement of the hull structure where required by Sections 2, 3, 5, and 6.

1.8.2 Further to the requirements of 1.6.6 a survey planning meeting is to be held between the attending Surveyor(s), the Owner/Navy's representative and the thickness measurement firm's representative, so as to ensure the safe and efficient execution of the surveys and thickness measurements to be carried out onboard.

1.8.3 Thickness measurements are normally to be taken by means of ultrasonic test equipment and are to be carried out by a company approved in accordance with LR's *Approval for Thickness Measurement of Hull Structures*.

1.8.4 The Surveyor may require measuring the thickness of the material in any portion of the structure where signs of wastage are evident or wastage is normally found. Any parts of the structure which are found defective or excessively reduced in scantlings are to be made good by materials of the approved scantlings and quality. Attention is to be given to the structure in way of discontinuities.

1.8.5 Thickness measurements are to be witnessed by the Surveyor. This requires the Surveyor to be on board, while the measurements are carried out, to the extent necessary to control the process. This also applies to thickness measurements carried out while the ship is at sea.

1.8.6 The Surveyor may extend the scope of thickness measurement if deemed necessary.

1.8.7 Where it is required as part of the survey to carry out thickness measurements for the structural areas subject to Close-up Survey, then these measurements are to be carried out simultaneously with the Close-up Survey.

1.8.8 Thickness measurements are to be taken at the forward and aft areas of shell plates. A number of readings should be taken in a local area, and averaged to provide the recorded reading. The extent of local substantial corrosion of plates is to be established by intensive measurement in the affected areas. Where measured plates are to be renewed, the thicknesses of adjacent plates in the same strake are to be reported.

1.8.9 A report is to be prepared by the approved company carrying out the thickness measurements. The report is to give the location of measurement, the thickness measured as well as the corresponding original thickness. The report is to give the date when measurement was carried out, the type of measuring equipment, names of personnel and their qualifications and is to be signed by the operator.

1.8.10 The thickness measurement report is to be verified and signed by the Surveyor and countersigned by an authorising Surveyor.

1.8.11 In all cases the extent of the thickness measurements is to be sufficient to represent the actual average condition.

■ Section 2 Annual Surveys – Hull, machinery and optional requirements

2.1 General

2.1.1 Annual Surveys are to be held concurrently with any relevant maintenance period and in consultation with the Owner with regard to operational needs.

2.1.2 At Annual Surveys, the Surveyor is to examine the hull, so far as necessary and practicable, in order to be satisfied as to its general condition.

2.1.3 Particular attention is to be paid to critical areas.

2.2 Hull

2.2.1 The Surveyor is to be satisfied regarding:

- (a) The efficient condition of doors, hatchways and lifts on upper and superstructure decks, weather deck plating and air pipes, exposed casings, deckhouses, superstructure bulkheads, side, bow and stern doors, windows, side scuttles and deadlights, guard rails, life-lines, ladders, pressure relief plates and other openings, together with all closing appliances and flame screens. In addition, the Surveyor is to externally examine all air pipe heads installed on exposed decks.
- (b) The efficient operating condition of mechanically operated hatch covers including stowage, fit, securing, locking, sealing and operational testing of hydraulic power components.
- (c) The efficient condition of scuppers and sanitary discharges (so far as is practicable); valves on discharge lines (so far as is practicable) and their controls; guard rails and bulwarks.

2.2.2 Any hatch covers and coamings together with any doors, lifts or ramps which form part of the watertight integrity of the hull are to be examined to ensure that no alterations have been made to the approved arrangements.

- (a) Mechanically operated lifts, hatch covers or doors are to be tested for tightness to confirm the satisfactory condition of securing and sealing arrangements; drainage channels; operating mechanisms. Associated drainage channels and operating mechanisms, such as tracks and wheels, are also to be examined to confirm they are in satisfactory condition.
- (b) Hatch covers of the portable type are to be examined to confirm that the covers and closing appliances are in a satisfactory condition.

This examination will include hatches and doors in superstructures.

2.2.3 The anchoring and mooring equipment is to be examined so far as is practicable.

2.2.4 The watertight doors/closures in watertight bulkheads and any indicators or alarms are to be examined and operationally tested locally and, where applicable, remotely. Other watertight bulkhead penetrations are to be examined so far as is practicable.

2.2.5 The Surveyor is to be satisfied regarding the draught marks on the ship's side.

2.2.6 The Surveyor is to be satisfied that no alterations have been made to the ship which affect stability and strength.

2.2.7 The surveyor is to be satisfied that any alterations to approved scantlings and arrangements to the structure of magazine spaces have been approved by LR, see Ch 2,4.4.7.

2.2.8 The Surveyor is to check the C11(N) on board the vessel and verify with the actual arrangement on board.

2.2.9 For steel ships, the requirements of 3.2.2 and 5.4.2 regarding the survey of water ballast spaces, compensated fuel tanks, integral sanitary tanks and bilges are also to be complied with as applicable.

2.2.10 The Surveyor is to carry out an examination and thickness measurement of structure identified at the previous Special Survey or Intermediate Survey as having substantial corrosion.

2.2.11 The first Annual Survey should include a review of the year's service, taking into account feedback from the Owner. Special attention needs to be given to areas of the structure where defects have become apparent. It is important that this information is fed back to the Design Authority and building yards for follow-on ships.

2.3 Machinery

2.3.1 The Surveyor is to generally examine the machinery and boiler spaces with particular attention being given to the propulsion system, auxiliary machinery and to the existence of any fire and explosion hazards. Emergency escape routes are to be checked to ensure that they are adequately identified and free of obstruction.

2.3.2 The means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the alternative steering position, if fitted, are to be tested.

2.3.3 The Surveyor is to examine and test in operation all main and auxiliary steering arrangements including their associated equipment and control systems.

2.3.4 The bilge pumping and dewatering systems and bilge wells, including operation of extended spindles and level alarms, where fitted, are to be examined so far as is practicable. Satisfactory operation of the bilge pumps and dewatering eductors is to be proven, including access to all bilge areas.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Section 2

2.3.5 Piping systems containing oil fuel, lubricating oil or other flammable liquids are to be generally examined and operated as far as practicable, with particular attention being paid to tightness, fire precaution arrangements, flexible hoses and sounding devices.

2.3.6 The Surveyor is to be satisfied regarding the condition of non-metallic joints in piping systems which penetrate the hull, where both the penetration and the non-metallic joint are below the deepest waterline.

2.3.7 The Surveyor is to be satisfied regarding the following items associated with machinery installations.

- (a) Locking arrangements for locked valves and inspection covers.
- (b) Integrity of guards for rotating machinery.
- (c) Lighting arrangements, particularly at control and instrumentation panels.
- (d) Operation of automatic start-up of pumps and systems for essential systems where they are required by the Rules.
- (e) Condition of machinery securing and mounting arrangements.
- (f) The condition of bulkhead glands.

2.3.8 The boilers, other pressure vessels and their accessories and associated fittings including safety devices, foundations, controls, relieving gear, high pressure and waste steam piping, insulation and gauges, are to be generally examined. Surveyors should confirm that Periodical Surveys of pressure vessels have been carried out as required by the Rules and that the safety devices have been tested.

2.3.9 Records of boiler treatment and analyses are to be retained on board and audited annually by the LR Surveyor. The water treatment and results of analyses are to be in accordance with the manufacturer's recommendations.

2.3.10 The main propulsion, essential auxiliary and emergency generators including safety arrangements, controls and foundations are to be generally examined. Surveyors are to confirm the Periodical Surveys of engines have been carried out as required by the Rules and that safety devices have been tested.

2.3.11 The electrical equipment and cabling forming the main and emergency electrical installations are to be generally examined under operating conditions as far as is practicable. Particular checks are to be made on the integrity of electrical enclosure and cleanliness of switchboards and bus bars. The satisfactory operation of the main and emergency sources of power and electrical services essential for safety in an emergency is to be verified; where the sources of power are automatically controlled they should be tested in the automatic mode. Bonding straps for the control of static electricity and earthing arrangements are to be examined where fitted.

2.3.12 The electrical installation in areas deemed dangerous, such as magazine spaces and spaces where low flash point oils are stored and handled and compartments adjacent to such spaces, is to be examined in order to verify that it is of the correct type, is in good condition and has been properly maintained.

2.3.13 For ships fitted with automation equipment for main propulsion, essential auxiliary and emergency machinery, a general examination of the equipment and arrangements is to be carried out. Records of changes to the hardware and software used for control and monitoring systems for propelling and essential auxiliary machinery since the original issue (and their identification) are to be reviewed by the attending Surveyor. Satisfactory operation of the safety devices and control systems is to be verified.

2.3.14 For ships fitted with an electronically controlled engine for main propulsion, essential auxiliary and emergency power purposes the following is to be carried out to the satisfaction of the Surveyor:

- (a) A general examination of the electronic control system and associated parts.
- (b) Verification of evidence of satisfactory operation of the engine and where possible this is to include a running test under load.
- (c) Verification of satisfactory operation of the safety devices and control systems.
- (d) Verification that any changes to hardware and software for control of the engine have been submitted and approved by LR.
- (e) Verification that any changes to control and monitoring arrangements that affect the operation of the engine have been submitted and approved by LR.
- (f) Verification that where changes have been carried out, there is evidence of acceptance tests and trials for Programmable Electronic Systems which include confirmation of software life cycle activities appropriate to the stage in the system's life cycle at the time of system examination.
- (g) Identification and verification that the key monitoring parameters/sensors are in working order.

2.3.15 On ships fitted with a dynamic positioning system, the control system and associated machinery items are to be generally examined and tested to demonstrate that they are in good working order.

2.3.16 For ships assigned with **NAV1** and/or **IBS** class notations, Annual Surveys are to be carried out in accordance with the approved test schedule as required by Vol 3, Pt 1, Ch 4, 1.2.1 to ascertain that the equipment and arrangements required for the applicable class notation(s) are being maintained in good working order. At the time of the survey, relevant statutory or Naval Authority Certificates may be accepted as evidence of satisfactory operation.

2.3.17 Dead ship starting arrangements for bringing machinery into operation without external aid are to be tested to the Surveyor's satisfaction.

2.3.18 The surveyor is to be satisfied that any alterations to approved equipment, piping, cabling and electrical systems in magazine spaces have been approved by LR, see Ch 2, 4.4.7.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Sections 2 & 3

2.4 Other notations

2.4.1 Where the options described in 2.4.2, 2.4.4 and 2.4.6 are required by the Owner, a notation will be assigned and surveys are to be included with the Annual Survey.

2.4.2 **Fire Protection (FIRE).** The arrangements for fire protection, fire detection and extinction are to be examined and are to include the following items:

- (a) Verification, so far as is reasonably practicable, that no significant changes have been made to the arrangements for fire protection.
- (b) Verification of the operation of manual and/or automatic doors where fitted.
- (c) Verification that fire control plans are properly posted;
- (d) Examination, so far as is possible, and testing as feasible, of the fire and/or smoke detection and alarm system(s).
- (e) Examination of the water fire-fighting system, and confirmation that each pump connected to the water fire fighting system, including any emergency fire pump can be operated separately so that the required jets of water can be produced simultaneously from different hydrants.
- (f) Verification that fire-hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations.
- (g) Examination of fixed fire-fighting systems, controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing, including date of last systems tests, including operational alarm tests.
- (h) Verification that all portable and semi-portable fire-extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random checks for evidence of discharged containers.
- (j) Verification, so far as is reasonably practicable, that the remote control for stopping fans in accommodation spaces and the means of cutting off power to the galley are in good working order.
- (k) Examination of the closing arrangements of ventilators, hatches and doorways where applicable.
- (l) Verification that the fireman's outfits are complete and in good condition.

2.4.3 **Escape and Emergency Access (ESC).** The arrangements for escape of personnel and emergency access are to be examined and are to include the following:

- (a) Verification, so far as is reasonably practical, that no significant changes have been made to the arrangements for escape and emergency access.
- (b) Verification that all normal and emergency escape and emergency access routes are free of obstruction.

2.4.4 **Life Saving and Evacuation Arrangements (LSAE).** The arrangements for life saving and evacuation are to be examined and are to include the following:

- (a) Verification, so far as is reasonably practicable, that no significant changes have been made to the arrangements for life saving and evacuation.
- (b) Verification of Life-jackets, Life-buoys, Immersion Suits, Thermal Protection Aids, etc., and their attachments for effectiveness and condition.
- (c) That rescue boats and survival craft have been serviced by an approved servicing company, and ascertain that they are identified and certificated with a valid date.

- (d) That the rescue boat and launching/recovery arrangements are in full working order.
- (e) That the survival craft launch arrangements are in a good working order.

2.4.5 **Safety of Navigation and Communication (SNC).** The arrangements for navigation and communication equipment are to be examined and are to include the following:

- (a) Verification, so far as is reasonably practicable that no significant changes have been made to the navigation and communication equipment.
- (b) That the ship is in possession of up-to-date Nautical Publications, Emergency Instructions, International Code of Signals, Operating Instructions for Life-saving Appliances and their maintenance.
- (c) Shipboard navigational equipment.
- (d) Signalling equipment (lights and sounds).
- (e) Navigation lights.
- (f) Rockets and signals (pyrotechnics).
- (g) Black shapes.

2.4.6 **Pollution Prevention (POL).** The arrangements for pollution prevention are to be examined and are to include the following:

- (a) **Oil.** Verification of piping system arrangements between tanks, bilge and ballast systems, which are used to transfer oil/oily water and ballast water to ensure that no changes have been made to the systems since they were installed. Checking oil filters, oily water separators and sludge/oily water residue containment.
- (b) **Sewage.** Verification of the sewage treatment arrangements, containment and the piping systems.
- (c) **Garbage.** Verification of the garbage disposal arrangements and the installation of the equipment to ensure that no unauthorised changes have been made.
- (d) **Air.** Verification that the engine exhaust emissions are still within the NO_x Technical Code.
Verification of the incinerator installation.
Re-testing the fuel oils to ensure that the sulphur content is still below 4,5 per cent.

Section 3 Intermediate Surveys – Hull and machinery requirements

3.1 General

3.1.1 Intermediate Surveys are to be held concurrently with any relevant maintenance period wherever practicable, see 2.1.1.

3.2 Hull

3.2.1 The requirements of Section 2 are to be complied with so far as applicable.

3.2.2 For steel ships a general examination of salt water ballast tanks, compensated fuel tanks, integral sanitary tanks and bilges is to be carried out as required below. If such inspections reveal no visible structural defects then the examination may be limited to a verification that the protective coating remains in GOOD condition as defined in 1.5.8. When considered necessary by the Surveyor thickness measurement of the structure is to be carried out. Where the protective coating is found to be other than in GOOD condition, and it has not been repaired, maintenance of Class will be subject to the spaces in question being internally examined and gauged as necessary at Annual Surveys.

- (a) For all ships over six years of age and up to 12 years of age, representative salt water ballast tanks, compensated fuel tanks, integral sanitary tanks and bilges are to be generally examined. Where the protective coating is found to be other than in GOOD condition, as defined in 1.5.8, or other defects are found, the examination is to be extended to other spaces of the same type.
- (b) For steel ships over twelve years of age all salt-water ballast tanks, compensated fuel tanks, integral sanitary tanks and bilges are to be generally examined.

3.2.3 For all ships over twelve years of age the anchors are to be partially lowered and raised using the capstan/windlass.

3.2.4 Representative internal spaces including fore and aft peak spaces, plated masts, machinery spaces, bilges, etc., are to be generally examined. These spaces should include all suspect areas, see 1.5.4.

3.2.5 The Surveyor is to carry out a Close-up Survey and thickness measurement of the structure identified at the previous Special Survey as having substantial corrosion.

3.3 Machinery

3.3.1 Machinery and boiler spaces including tank tops, bilges and cofferdams, sea suction and overboard discharges are to be generally examined.

3.3.2 Areas deemed dangerous, such as magazine spaces and spaces where low flash point oils are stored and handled and compartments adjacent to such spaces are to be examined for the following type:

- (a) Defective and non-certified safe electrical equipment.
- (b) Improperly installed, defective and dead-end wiring. An electrical insulation resistance test of the circuits terminating in, or passing through dangerous spaces is to be carried out.

3.3.3 Electrical generators are to be examined under working conditions to verify compliance with Vol 2, Pt 10, Ch 1,2.

Section 4 Docking Surveys and In-water Surveys

4.1 General

4.1.1 At Docking Surveys or In-water Surveys the Surveyor is to examine the ship and machinery so far as necessary and practicable, in order to be satisfied as to the general condition.

4.2 Docking Surveys

4.2.1 Where a ship is in dry-dock or on a slipway it is to be placed on blocks of sufficient height, and proper staging is to be erected as may be necessary for the examination of the outside of the hull, rudder(s) and underwater fittings. The outside surface of the hull is to be cleaned as may be required by the Surveyor.

4.2.2 The external shell plating is to be examined for excessive corrosion, structural deterioration from causes such as high stresses, chaffing or contact with the ground, to areas of structural discontinuity and for undue unfairness or buckling. Special attention is to be given to the connection between the bilge strakes and the bilge keels.

4.2.3 The following parts of the external hull structure are to be specially examined:

- (a) For steel hulls attention is to be given to parts of the structure particularly liable to excessive corrosion and to any undue unfairness of the plating of the bottom. The coating system is to be examined and made good as necessary.
- (b) For aluminium alloy hulls attention is to be given to areas adjacent to any bimetallic connections at skin fittings, etc.
- (c) For composite hulls the gelcoat or other protective finish is to be examined for surface cracking, blistering, abrasion or other damage which may impair the efficiency of the protection to the underlying laminate.

4.2.4 Where fitted, the satisfactory condition, attachment and operation of the cathodic protection (active or passive) is to be confirmed.

4.2.5 The sea connections and overboard discharge valves, their attachments to the hull and the gratings, at the sea inlets are to be examined. Where applicable, pressure testing of the rudder may be required if deemed necessary by the Surveyor.

4.2.6 The clearances of the rudder bearings and pintles are to be measured. Where considered necessary by the Surveyor, rudders and stabilisers are to be lifted for examination of the stock. The securing of rudder and stabiliser couplings is to be confirmed.

4.2.7 Special attention is to be given to the hull in way of underwater fittings such as thrusters, shaft brackets, stabilisers, rudders, rope guards, eddy plates, GRP domes, bilge keels, echo sounders, and their attachments.

4.2.8 Where applicable, attention is to be given to the connection and/or intersection of the cross-deck structure to the hulls of multi-hull ships.

4.2.9 When chain cables are ranged, the anchors and cables are to be examined by the Surveyor, see also 5.3.6 and Table 3.5.1.

4.2.10 For Surface Effect Ships any flexible skirts together with their attachment are to be examined.

4.2.11 For hydrofoil or foil assisted craft the attachment of foils is to be examined.

4.2.12 The Surveyor is to verify all draught markings as applicable at the time of dry-docking.

4.2.13 When Machinery Naval Class has been adopted, the following items are additionally applicable. The work is to be carried out in accordance with maintenance manuals and the manufacturer's recommendations for servicing and renewals observed.

- (a) The propeller and fastenings are to be examined. (Where a controllable pitch propeller is fitted, examination is to include blade fastenings and hub). The sternbush is to be examined as far as practicable.
- (b) Where propeller shafts are wrapped for corrosion protection, the condition of the wrapping is to be confirmed.
- (c) The clearance in the sternbush or the efficiency of the oil glands is to be ascertained. The clearance of any shaft bracket bearing is to be ascertained.
- (d) The inboard shaft seals or glands are to be examined. Where flexible sternglands are fitted, the satisfactory condition of the rubber hose and securing clips is to be confirmed. Where inflatable shaft seals are fitted, their condition and operation is to be verified.
- (e) Where water jet units are fitted, the impeller, hull ducting, grating, nozzle steering and reversing arrangements are to be examined as far as practicable.
- (f) Where podded propulsion units are fitted, the bearings and sealing arrangements, steering ring and thrust bearings in the hull are to be examined as far as practicable.

4.3 In-water Surveys

4.3.1 The Committee will accept an In-water Survey between Special Surveys, as a Docking Survey, where suitable protection is applied to the underwater portion of the hull. If requested, the ***IWS** notation may be assigned on satisfactory completion of the survey, provided that the applicable requirements of the Rules are complied with.

4.3.2 The In-water Survey is to provide the information normally obtained from the Docking Survey, see 4.2.2 to 4.2.13.

4.3.3 The underwater part of the hull should be marked with search lines for reference purposes.

4.3.4 The In-water Survey is to be carried out at an agreed geographical location under the surveillance of a Surveyor to LR, with the ship in sheltered waters and with weak tidal streams and currents. The in-water visibility is to be good and the hull below the waterline is to be clean. The Surveyor is to be satisfied that the method of pictorial presentation is satisfactory by use of CCTV. There is to be good two-way communication between the Surveyor and the diver.

4.3.5 Prior to commencing the In-water Survey, the equipment and procedures for both observing and reporting the survey are to be agreed between the Owners, the Surveyor and the diving firm.

4.3.6 The In-water Survey is to be carried out by a qualified diver employed by the firm approved by LR.

4.3.7 If the In-water Survey reveals damage or deterioration that requires early attention, the Surveyor may, in consultation with the Owner, require that the ship be dry-docked in order that a fuller survey can be undertaken and the necessary work carried out.

4.3.8 Where a vessel has the ***IWS** notation, the condition of the high resistant paint is to be confirmed at each dry-docking in order that the ***IWS** notation can be maintained.

■ Section 5 Special Survey – Hull requirements

5.1 General

5.1.1 The survey is to be of sufficient extent to ensure that the hull and related equipment is in satisfactory condition and is fit for its intended purpose, subject to proper maintenance and operation and to Periodical Surveys being carried out as required by the Regulations.

5.1.2 The requirements of Section 2 are to be complied with so far as applicable.

5.1.3 A Docking Survey in accordance with the requirements of 4.2 is to be carried out as part of the Special Survey.

5.2 Preparation

5.2.1 The ship is to be prepared for survey in accordance with the requirements of Table 3.5.1. The preparation should be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, erosion, deformation, fractures, damages and other structural deterioration.

5.2.2 Where, in accordance with Table 3.5.1, the ship is opened out by removal of linings, etc., and defects are found, further opening out may be required in order that the Surveyor can confirm the full extent of the defects.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Section 5

Table 3.5.1 Survey preparation

Special Survey I (Ship 6 years old)	Special Survey II (Ship 12 years old)	Special Survey III (Ship 18 years old) and subsequent special surveys
<p>(1) All spaces in the ship are to be cleared and cleaned as necessary, including all bilge spaces in order that the Surveyor may be satisfied as to the condition of the structure, see 1.5.3 and 1.5.4. A record is to be made of where equipment was removed during the survey. This record is to be retained for reference during subsequent surveys.</p> <p>(2) Machinery compartments are to be cleared and cleaned as necessary, and the bilges cleaned and prepared for examination. Floor plates in engine spaces are to be lifted as may be necessary for the examination of the structure below. Where necessary, pipework may be required to be removed for examination of the structure.</p> <p>(3) In ships having wood decking or sheathing, and in refrigerated stores, a sufficient amount of material covering the structure is to be removed for access and examination. The amount of removal will depend upon the condition found and will be to the Surveyor's satisfaction.</p> <p>(4) Tanks are to be cleaned as necessary in order to satisfy the requirements of Table 3.5.2.</p>	<p>In addition to the requirements for Special Survey I, the following are to be complied with:</p> <p>(1) The chain locker is to be cleared and cleaned internally for examination of the structure and examination of the cable securing arrangements. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection.</p> <p>(2) The rudders are to be unshipped for examination of the rudder stock and trunk at the discretion of the Surveyor.</p>	<p>In addition to the requirements for Special Survey II the following are to be complied with:</p> <p>(1) Samples of lagging and lining are to be removed in order that the Surveyor may be satisfied as to the condition of the structure.</p> <p>(2) All wood decks and sheathing, or other covering, on steel decks are to be removed in order to ascertain the condition of the structure.</p>
<p>NOTES</p> <p>1. These requirements can be amended to reflect proven information concerning the performance of structure through an Owner's maintenance system such as 'Reliability Centred Maintenance'.</p> <p>2. Where permanent ballast is fitted, samples of ballast are to be removed for examination of the structure underneath. The condition of the exposed structure is to be to the satisfaction of the Surveyor.</p>		

5.3 Examination and testing – General

5.3.1 All spaces within the hull and superstructure including integral tanks are to be examined, see also 5.4.1 for tank examinations on steel ships. Special attention is to be paid to any suspect areas, see 1.5.4. and Table 3.5.1.

5.3.2 Double bottom, deep, ballast, peak and other tanks assigned also for the carriage of salt water ballast, are to be tested with a head of liquid to the top of air pipes or to the top of hatches for ballast/cargo holds. Boundaries of oil fuel, lubricating oil and fresh water tanks are to be tested with a head of liquid to the maximum filling level of the tank. Tank testing of oil fuel, lubricating oil and fresh water tanks may be specially considered based upon a satisfactory external examination of the tank boundaries, and a confirmation from the Commanding Officer stating that the pressure testing has been carried out according to the requirements with satisfactory results.

5.3.3 Where repairs are effected to the hull or bulkheads, any integral tanks in way are to be tested to the Surveyor's satisfaction on completion of these repairs.

5.3.4 All decks, masts and superstructures are to be examined.

5.3.5 Attention is to be given to the corners of openings and other discontinuities in the hull structure.

5.3.6 The anchors are to be examined, the chain cables are to be ranged and they are to be examined together with the chain locker (see Table 3.5.1) and clench plate. If any length of chain cable is found to be reduced in mean diameter at its most worn part by 12 per cent or more from its nominal diameter, it is to be renewed. Cables are to be changed 'end-for-end'. Anchor handling arrangements are to be examined.

5.3.7 Representative fastenings on the weatherdecks, e.g. for guardrails and spurnwaters, are to be tested to ascertain their soundness and may require to be drawn for examination at the discretion of the Surveyor.

5.3.8 When applicable, the Surveyor is to be satisfied as to the efficient condition of the means of escape from crew spaces, and spaces in which crew are normally employed.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Section 5

5.3.9 The hand pumps, suction, watertight doors, air and sounding pipes are to be examined. In addition, the Surveyor is to internally examine air pipe heads in accordance with the requirements of Table 3.5.3.

5.4 Examination and testing – Additional items for steel ships

5.4.1 The requirements for tank internal examination are given in Table 3.5.2.

Table 3.5.2 Tank internal examination requirements for steel ships

Tank	Special Survey I (Ship 6 years old)	Special Survey II (Ship 12 years old)	Special Survey III (Ship 18 years old)	Special Survey IV (Ship 24 years old)	All Subsequent Special Surveys
Peaks	All tanks	All tanks	All tanks	All tanks	All tanks
Salt water ballast	All tanks	All tanks	All tanks	All tanks	All tanks
Lubricating oil	None	None	None	See Notes 1 and 2 One tank	One tank
Fresh water	None	One tank	All tanks	See Notes 1 and 2 All tanks	All tanks
Oil fuel - in way of (i) Machinery space (ii) Supply (Replenishment)	None	None	One tank	One tank	One tank
Oil Area	None	One tank	Two tanks see Note 3	50% of tanks see Notes 3 and 4	50% of tanks see Notes 3 and 4
Oil Fuel (water compensated)	All tanks	All tanks	All tanks	All tanks	All tanks
Sanitary	All tanks	All tanks	All tanks	All tanks	All tanks
NOTES 1. The above requirements apply to integral tanks only. 2. Where a selected number of tanks are examined, then different tanks are to be examined at each Special Survey on a rotational basis. 3. To include one deep tank, if any. 4. Where 50% of tanks are to be examined, a minimum of two tanks are required to be examined depending upon the overall number of tanks. 5. When examining tanks internally the Surveyor is to verify that striking plates or other additional reinforcement is fitted under sounding pipes. In the case of tanks only with remote gauging facilities, the satisfactory operation of the gauges is to be confirmed. 6. Particular care must be taken in examining structure under suction. 7. Where testing is required, a functional test may be acceptable at the Surveyor's discretion.					

Table 3.5.3 Airpipe head internal examination requirements

Special Survey I (Ship 6 years old)	Special Survey II (Ship 12 years old)	Special Survey III (Ship 18 years old) and subsequent
(1) Two air pipe heads (one port and one starboard) on exposed decks in the forward 0,25L. (See Notes 1 to 5) (2) Two air pipe heads (one port and one starboard) on the exposed decks, serving spaces aft of 0,25L. (See Notes 1 to 5)	(1) All air pipe heads on exposed decks in the forward 0,25L. (See Notes 1 to 5) (2) At least 20% of air pipe heads on exposed decks, serving spaces aft of 0,25L. (See Notes 1 to 5)	All air pipe heads on exposed decks. (See Notes 1 to 6)
NOTES 1. Air pipe heads serving ballast tanks are to be selected where available. 2. The Surveyor is to select which air pipe heads are to be examined. 3. Where considered necessary by the Surveyor as a result of the examinations, the extent of examinations may be extended to include other air pipe heads on exposed decks. 4. Where the inner parts of the air pipe head cannot be properly examined due to its design, it is to be removed in order to allow an internal examination. 5. Particular attention is to be given to the condition of the zinc coating in heads constructed from galvanised steel. 6. Exemption may be considered for air pipe heads where there is documented evidence of their replacement within the previous six years.		

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Sections 5 & 6

5.4.2 In salt water ballast spaces, integral sanitary tanks and bilges where the protective coating is found to be other than in GOOD condition as defined in 1.5.8 and it has not been repaired, maintenance of class will be subject to the spaces in question being internally examined and gauged.

5.4.3 The protection of steelwork, other than as referred to in 5.4.2 should be examined and made good where necessary on satisfactory completion of the survey. In areas where the inner surface of the bottom plating is covered with cement, asphalt or other composition, the removal of this covering may be dispensed with, provided that it is found sound and adhering satisfactorily to the steel.

5.4.4 Wood deck sheathing is to be examined and the caulking is to be tested and recaulked as necessary. If decay or rot is found, or the wood is excessively worn, the wood is to be renewed. Attention is to be given to the condition of the plating under wood deck sheathing or other deck covering. If it is found that such coverings are broken, or are not adhering closely to the plating, sections are to be removed as necessary to ascertain the condition of the plating, see *also* 1.2.1.

5.4.5 The structure in way of bimetallic connections, e.g. to aluminium alloy deckhouses, is to be examined and the efficiency of the insulation arrangements confirmed.

5.5 Examination and testing – Additional items for composite ships

5.5.1 The bonded attachments of frames, floors, bulkheads, structural joinery, engine bearers, sterntubes, rudder tubes, and integral tank boundaries are to be examined.

5.5.2 The hull to deck joint, together with any joints between the deck and deckhouses or superstructures, are to be examined.

5.5.3 The structure in way of the bolted attachment of fittings including guardrail stanchions, capstan/windlass, shaft brackets, fendering, mooring bitts, etc., is to be examined.

6.1.3 In areas where substantial corrosion, as defined in 1.5, has been noted, then additional measurements are to be carried out, as applicable, in accordance with Table 3.6.2 to determine the full extent of the corrosion pattern.

6.1.4 Where substantial corrosion is identified and not rectified, this will be subject to re-examination and gauging as necessary at Annual and Intermediate Surveys.

6.1.5 At each Special Survey, thickness measurements are to be taken in way of critical areas, as considered necessary by the Surveyor. Critical areas are to include locations throughout the ship that show substantial corrosion and/or are considered prone to rapid wastage.

6.1.6 The Surveyor may extend the scope of thickness measurement if deemed necessary.

6.2 Thickness measurement reporting

6.2.1 A report is to be prepared by the approved company carrying out the thickness measurement. The report is to give the location of measurement, the thickness measured as well as the corresponding original thickness. The report is to give the date when the measurement was carried out, the type of measuring equipment, names of personnel and their qualifications and is to be signed by the operator.

6.2.2 The thickness measurement report is to be verified and signed by the Surveyor, and included with the Surveyor's report.

■ Section 6 Special Survey – Thickness measurement requirements for steel ships

6.1 General

6.1.1 Thickness measurement requirements for steel ships are stated in Tables 3.6.1 and 3.6.2. See *also* 1.8.

6.1.2 Thickness measurements may be carried out in association with the fifth Annual Survey.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Sections 6 & 7

Table 3.6.1 Thickness measurement of steel ships

Special Survey I (Ship 6 years old)	Special Survey II (Ship 12 years old)	Special Survey III (Ship 18 years old)	Special Survey IV and subsequent (Ship 24 years old and over)
(1) Bottom and lower parts of chain locker. (2) Critical and Suspect areas, as required by the Surveyor and may include areas where the coatings are found to be other than in GOOD condition.	(1) Wind and water strakes in way of 0,5L amidships. (2) Bottom and lower parts of chain locker. (3) Critical and Suspect areas, as required by the Surveyor and may include areas where the coatings are found to be other than in GOOD condition.	(1) Weatherdeck plating under wood deck planking or sheathing. (2) Shell plating in way of the waterline throughout the length of the ship. (3) Two complete transverse sections of deck and shell plating within 0,5L amidships, one of which should be in way of a machinery space. (4) Bottom and lower parts of chain locker. (5) Critical and Suspect areas, as required by the Surveyor and may include areas where the coatings are found to be other than in GOOD condition.	(1) All weatherdeck plating outside deckhouses or super-structures and including plating under wood deck planking or sheathing. (2) Shell plating in way of, and below, the waterline throughout the length of the ship. (3) Two complete transverse sections of deck and shell plating within 0,5L amidships, one of which should be in way of a machinery space. (4) Bottom and lower parts of chain locker. (5) Critical and Suspect areas, as required by the Surveyor and to include as applicable: (a) Areas where the coatings are found to be other than in GOOD condition. (b) Bottom shell in way of any cement, asphalt, ballast or other composition. (c) Deck plating and side shell plating in way of galleys, washrooms and refrigerated store spaces and any other wet spaces. (d) Structure in way of integral sanitary tanks.
NOTE See 1.5.8 for the definition of GOOD condition.			

Table 3.6.2 Thickness measurement – Additional requirements in way of structure identified with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
Plating	Suspect areas and adjacent plates	5 point pattern over 1 m ²
Stiffeners	Suspect areas	3 measurements each in line across web and flange

Section 7 Machinery survey – General requirements

7.1 Annual, Intermediate and Docking Survey

7.1.1 For Annual, Intermediate and Docking Surveys, see Sections 2, 3 and 4.

7.2 Complete Survey

7.2.1 While the ship is in dry-dock, all openings to the sea in the machinery spaces, together with the valves, cocks and the fastenings with which these are connected to the hull, are to be examined.

7.2.2 All shafts (except screwshafts and tube shafts, for which special arrangements are detailed in Section 13), thrust block and all bearings are to be examined. The lower halves of bearings need not be exposed if alignment and wear are found to be acceptable.

7.2.3 An examination is to be made of all reduction gears complete with all wheels, pinions, shafts, bearings and gear teeth, thrust bearings and incorporated brake and clutch arrangements where fitted.

7.2.4 The following auxiliaries and components are also to be examined:

- (a) Auxiliary engines, auxiliary air compressors with their intercoolers, filters and/or oil separators and safety devices, and all pumps and components used for essential services.
- (b) Steering machinery.
- (c) Windlass and associated driving equipment, where fitted.
- (d) The holding down bolts, chocks of main and auxiliary engines, gearcases, thrust blocks and intermediate shaft bearings.
- (e) Evaporators (other than those of vacuum type) and their safety valves, which should be seen in operation under steam.

7.2.5 All air receivers for essential services, together with their mountings, valves and safety devices, are to be cleaned internally and examined internally and externally. If internal examination of the air receivers is not practicable, they are to be tested hydraulically to 1,3 times the working pressure.

7.2.6 The valves, cocks and strainers of the bilge and salvage system including bilge injection, are to be opened up as considered necessary by the Surveyor and together with pipes, are to be examined and tested under working conditions. The oil fuel, feed, lubricating oil and cooling water systems also the ballast connections together with all pressure filters, heaters and coolers used for essential services, are to be opened up and examined or tested, as considered necessary by the Surveyor. All safety devices for the foregoing items are to be examined.

7.2.7 Fuel tanks which do not form part of the ship's structure are to be examined, and if considered necessary by the Surveyor, they are to be tested to the pressure specified for new tanks. The tanks need not be examined internally at the first survey if they are found satisfactory on external inspection. The mountings, fittings and remote controls of all oil fuel tanks are to be examined, so far as is practicable.

7.2.8 Where remote and/or automatic controls are fitted for essential machinery, they are to be tested to demonstrate that they are in good working order.

7.2.9 For ships fitted with a dynamic positioning system, the control system and associated machinery items are to be examined and tested under operating conditions to an approved Test Schedule.

7.2.10 In addition to the above, detailed requirements for steam and gas turbines, oil engines, electrical installations and boilers are given in Sections 8, 9 10 and 11 respectively. In certain instances, upon application by the Owner or where indicated by the maker's servicing recommendations, LR will give consideration to the circumstances where deviation from these detailed requirements is warranted, taking account of design, appropriate indicating equipment (e.g. vibration indicators) and operational records.

7.2.11 Where machinery installation include a 'lifed item' the requirements of Ch 2,4.5.21 are applicable.

Section 8 Turbines – Detailed requirements

8.1 Complete Survey

8.1.1 The requirements of Section 7 are to be complied with.

8.1.2 The following parts are to be opened out and examined:

The working parts of the main turbines and of auxiliary machinery used for essential services, including bulk-head stop valves, manoeuvring valves, the blading, rotors, flexible couplings and casings.

8.1.3 In gas turbines the following parts are to be opened out and examined:

The impellers or blading, rotors and casings of the air compressors, the combustion chambers, burners, intercoolers, heat exchangers, gas and air piping and fittings, starting and reversing arrangements.

8.1.4 Condensers, steam reheaters, desuperheaters which are not incorporated in the boilers, and any other appliances used for essential services, are to be examined to the satisfaction of the Surveyor, and if it is considered necessary, they are to be tested.

8.1.5 The manoeuvring of the turbines is to be tested under working conditions.

8.2 Turbine condition monitoring (TCM)

8.2.1 Where the main propulsion steam turbines are provided with approved vibration monitoring equipment, a machinery notation **TCM** (Turbine Condition Monitoring) may be assigned provided that the following conditions are complied with:

- (a) Vibration measurements recorded with equipment acceptable to LR are to be taken at regular intervals not exceeding six months. The records are to be retained on board and be available to the LR Surveyors for assessment at time of survey.
- (b) Rotor position indicators are to be installed permanently on each turbine. Records of these readings are to be retained on board the ship for inspection by the LR Surveyor at time of survey.

8.2.2 For maintenance of the **TCM** notation, the records of vibration monitoring and rotor position readings are to be audited annually.

8.2.3 In addition to the vibration readings at the time of the survey, it is necessary to carry out a full power trial to demonstrate to the LR Surveyor that the turbines are in good working order.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Sections 8, 9 & 10

8.2.4 Where the notation **TCM** has been assigned the main steam turbine top casings need not be lifted for examination of the rotors and diaphragms as required by 8.1.2 provided the condition monitoring data is found within limits set by acceptance standards. The remaining requirements of 8.1.2 are to be complied with. Where the Surveyor considers that the data presented is not entirely to his satisfaction, the top casing will be required to be lifted.

■ Section 9 Oil engines – Detailed requirements

9.1 Complete Survey

9.1.1 The requirements of Section 7 are to be complied with.

9.1.2 The following parts are to be opened out and examined:

Cylinders, covers, valves and valve gear, pistons and piston rods, crossheads, guides, connecting rods and crankshafts and all bearings, crankcases, bedplates, entablatures, crankcase door fastenings and explosion relief devices, scavenge relief devices, scavenge pumps, scavenge blowers, superchargers and their associated coolers, air compressors and their intercoolers, filters and/or separators and safety devices, fuel pumps and fittings, camshaft drives and balancer units, vibration dampers or detuners, flexible couplings and clutches, reverse gears, attached pumps and cooling arrangements.

9.1.3 Selected pipes in the starting air system are to be removed for internal examination and are to be hammer tested. If any appreciable amount of lubricating oil is found in the pipes, the starting air system is to be thoroughly cleaned internally by steaming out, or other suitable means. Some of the pipes selected are to be those adjacent to the starting air valves at the cylinders and to the discharges from the air compressors. This requirement is only applicable to oil engines using compressed air directly into individual cylinders through starting air valves, it is not applicable to air motor starting systems.

9.1.4 The manoeuvring of engines is to be tested under working conditions. Initial starting arrangements are to be tested.

9.1.5 Where steam is used for essential purposes, the condensing plant, feed pumps and oil fuel burning plant are to be examined and the steam pipes examined and tested as detailed in Section 12.

■ Section 10 Electrical equipment

10.1 Annual and Intermediate Surveys

10.1.1 The requirements of 2.3 and 3.3 are to be complied with as far as applicable.

10.2 Complete Surveys

10.2.1 An electrical insulation resistance test is to be made on the electrical equipment and cables. The installation may be sub-divided, or equipment which may be damaged disconnected, for the purpose of this test.

10.2.2 The fittings on the main and emergency switchboards, section boards and distribution boards are to be examined and over-current protective devices and fuses inspected to verify that they provide suitable protection for their respective circuits.

10.2.3 Generator circuit-breakers are to be tested, so far as is practicable, to verify that protective devices including preference tripping relays, if fitted, operate satisfactorily.

10.2.4 The electric cables and their securing arrangements are to be examined, so far as is practicable, without undue disturbance of fixtures or casings unless opening up is considered necessary as a result of observation or of the tests required by 10.2.1. The Surveyor is also to be satisfied regarding the condition of glands at watertight and gastight bulkheads.

10.2.5 The generator prime movers are to be surveyed as required by Sections 8 and 9 and the governing of the engines tested. The motors concerned with essential services together with associated control and switch gear are to be examined and if considered necessary, are to be operated, so far as is practicable, under working conditions. All generators and steering gear motors are to be examined and are to be operated under working conditions, though not necessarily under full load or simultaneously.

10.2.6 Where transformers associated with supplies to essential services are liquid immersed, the Owner is to arrange for samples of the liquid to be taken and tested for breakdown voltage, acidity and moisture, by a competent authority, in accordance with the equipment manufacturer's requirements, and a certificate giving the test results is to be furnished to the Surveyor.

10.2.7 Navigation light indicators are to be tried under working conditions, and correct operation on the failure of supply or failure of navigation lights verified.

10.2.8 The emergency sources of electrical power, where fitted, together with their automatic arrangements and associated circuits are to be tested.

10.2.9 Emergency lighting, transitional emergency lighting, supplementary emergency lighting, general emergency alarm and public address systems are to be tested as far as practicable.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Sections 10, 11 & 12

10.2.10 Where the ship is electrically propelled, the propulsion motors, generators, conversion equipment, cables and all ancillary electrical gear, exciters and ventilating plant (including coolers) associated therewith are to be examined, and the insulation resistance to earth is to be tested. Special attention is to be given to windings, commutators and slip-rings. The operation of protective gear and alarm devices is to be checked, so far as is practicable. Insulating oil if used, is to be tested in accordance with 10.2.6. Interlocks intended to prevent unsafe operations or unauthorised access are to be checked to verify that they are functioning correctly. Emergency overspeed governors are to be tested.

10.2.11 A General Examination of the electrical equipment in areas which may contain flammable gas or vapour and/or combustible dust is to be made to ensure that the integrity of the safe type electrical equipment has not been impaired owing to corrosion, missing bolts, etc., and that there is not an excessive build-up of dust on or in dust protected electrical equipment. Cable runs are to be examined for sheath and armouring defects, where practicable, and to ensure that the means of supporting the cables are in good order. Tests are to be carried out to demonstrate the effectiveness of bonding straps for the control of static electricity. Alarms and interlocks associated with pressurised equipment or spaces are to be tested for correct operation.

■ Section 11 Boilers

11.1 Frequency of survey

11.1.1 All boilers, economisers, steam receivers, steam heated steam generators, thermal oil and hot water units intended for essential services, together with boilers used exclusively for non-essential services having a working pressure exceeding 3,4 bar and a heating surface exceeding 4,65 m² are to be surveyed at intervals not exceeding 3 years and generally examined externally at the time of the Annual Survey of the ship.

11.2 Scope of surveys

11.2.1 At the surveys described in 11.1 the boilers, superheaters, economisers and air heaters are to be examined internally and externally and where considered necessary, the pressure parts are to be tested by hydraulic pressure and the thickness of plates and tubes and sizes of stays are to be ascertained to determine a safe working pressure. The principal mountings on boilers, superheaters and economisers are to be opened up and examined and the safety valves are to be set under steam to a pressure not greater than the approved design pressures of the respective parts. As a working tolerance, the setting is acceptable provided that the valves lift at not more than 103 per cent of the approved design pressure. The remaining mountings are to be examined externally and if considered necessary by the Surveyor, are to be opened up for internal examination. Collision chocks, rolling stays and boiler stools are to be examined and maintained in an efficient condition.

11.2.2 In fired boilers employing forced circulation, the pumps used for this service are to be opened and examined at each Boiler Survey.

11.2.3 The oil fuel burning system is to be examined under working conditions and a General Examination made of fuel tank valves, pipes, deck control gear and oil discharge pipes between pumps and burners.

11.2.4 At each survey of a cylindrical boiler which is fitted with smoke tube superheaters, the saturated steam pipes are to be examined as detailed in Section 12.

11.2.5 At the Annual General Examination referred to in 11.1.1 the requirements of 2.3.7 and 2.3.8 are to be complied with.

■ Section 12 Steam pipes

12.1 Frequency of survey

12.1.1 Saturated steam pipes, also superheated steam pipes where the temperature of the steam at the superheater outlet is not over 450°C, are to be surveyed 12 years from the date of build (or installation) and thereafter at six-yearly intervals.

12.1.2 Superheated steam pipes where the temperature of the steam at the superheater outlet is over 450°C are to be surveyed after six years from the date of build (or installation) thereafter at six-yearly intervals.

12.1.3 At 12 years from the date of build (or installation) thereafter at six-yearly intervals, all copper or copper alloy steam pipes over 76 mm external diameter supplying steam for essential services at sea, are to be hydraulically tested to twice the working pressure.

12.2 Scope of surveys

12.2.1 At each survey a selected number of main steam pipes, also of auxiliary steam pipes, which:

- (a) are over 76 mm external diameter;
- (b) supply steam for essential services at sea; and
- (c) have bolted joints,

are to be removed for internal examination and are to be hydraulically tested to 1,5 times the working pressure. If these selected pipes are found satisfactory in all respects, the remainder need not be tested. So far as is practicable, the pipes are to be selected for examination and hydraulic test in rotation so that in the course of the surveys all sections of the pipeline will be tested.

12.2.2 Where main and/or auxiliary steam pipes of the category described in 12.2.1(a) and (b) have welded joints between the lengths of pipe and/or between pipes and valves, the lagging in the way of the welds is to be removed, and welds examined and if considered necessary by the Surveyor, crack detected. Pipe ranges having welded joints are to be hydraulically tested to 1,5 times the working pressure. Where lengths having ordinary bolted joints are fitted in such pipe ranges and can be readily disconnected, they are to be removed for internal examination and hydraulically tested to 1,5 times the working pressure.

12.2.3 Where, on cylindrical boilers having smoke tube superheaters, the saturated steam pipes adjoining the saturated steam headers are situated partly in the boiler smoke boxes, all such pipe adjoining and cross-connecting these headers in the smoke boxes are, at the surveys required by 12.1 to be included in the pipes selected for examination and testing as defined in 12.2.1. Where the saturated steam pipes inside the smoke boxes consist of steel castings of substantial construction, these requirements need only to be applied to a sample casting. Where steel castings are not fitted, the Surveyor is to satisfy himself of the condition of the ends of the saturated steam pipes in the smoke boxes at each Boiler Survey and if he considers it necessary, a sample pipe is to be removed for examination.

12.2.4 At the surveys specified in 12.1.3, any of the copper or copper alloy pipes, such as those having expansion or other bends, which may be subject to bending and/or vibration, also closing lengths adjacent to steam driven machinery, are to be annealed before being tested.

12.2.5 Where it is inconvenient for the Owner to fulfil all the requirements of a Steam Pipe Survey at its due date, LR will be prepared to consider postponement of the survey, either wholly or in part.

■ Section 13 Screwshafts, tube shafts and propellers

13.1 Frequency of surveys

13.1.1 Shafts with keyed propeller attachments and fitted with continuous liners or approved oil glands, or made of approved corrosion resistant materials, are to be surveyed at intervals of six years when the keyway complies fully with the present Rules.

13.1.2 Shafts having keyless type propeller attachments are to be surveyed at intervals of six years provided they are fitted with approved oil glands or are made of approved corrosion resistant materials.

13.1.3 Shafts having solid coupling flanges at the after end are to be surveyed at intervals of six years provided they are fitted with approved oil glands or are made of approved corrosion resistant materials.

13.1.4 All other shafts not covered by 13.1.1 to 13.1.3 are to be surveyed at intervals of 3 years.

13.1.5 Controllable pitch propellers for main propulsion purposes are to be surveyed at the same intervals as the screwshaft.

13.1.6 Directional propeller and podded propulsion units for main propulsion purposes are to be surveyed at intervals not exceeding six years.

13.1.7 Water jet units for main propulsion purposes are to be surveyed at intervals not exceeding six years provided the impeller shafts are made of approved corrosion resistant material or have approved equivalent arrangements.

13.1.8 Dynamic positioning and/or thruster assisted mooring and athwartship thrust propellers and shaftings are to be surveyed at intervals not exceeding six years.

13.2 Normal surveys

13.2.1 All screwshafts are to be withdrawn for examination by LR Surveyors at the intervals prescribed in 13.1.1 to 13.1.4. The after end of the cylindrical part of the shaft and forward one third of the shaft cone, or fillet of the flange, is to be examined by a magnetic particle crack detection method. In the case of a keyed propeller attachment at least the forward one third of the shaft cone is to be examined with the key removed. Wear down is to be measured and the stern tube bearings, oil glands, propellers and fastenings are to be examined. Controllable pitch propellers where fitted are to be opened up and the working parts examined, together with the control gear.

13.2.2 Directional propeller and podded propulsion units are to be dismantled for examination of the propellers, shafts, gearing, and control and electrical gear.

13.2.3 Water Jet Units are to be dismantled for examination of the impeller, casing, shaft, shaft seal, shaft bearing, inlet and outlets channels, steering nozzle, reversing arrangements, and control gear.

13.2.4 Dynamic positioning and/or thruster assisted mooring and athwartship thrust propellers are to be generally examined so far as is possible in dry-dock and tested under working conditions afloat for satisfactory operation.

13.2.5 Podded propulsion unit screwshaft roller bearings are to be renewed when the residual calculated life at the maximum continuous rating at time of survey, no longer exceeds the survey interval. See Vol 2, Pt 4, Ch 4,6.3.8.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Sections 13 & 14

13.3 Screwshaft Condition Monitoring (SCM)

13.3.1 Where oil lubricated shafts with approved oil glands are fitted, a machinery notation **SCM** (Screwshaft Condition Monitoring) may be assigned provided that the following conditions are complied with:

- (a) Lubricating oil analysis to be carried out regularly at intervals not exceeding six months. The lubricating oil analysis documentation is to be available on board. Each analysis is to include the following minimum parameters:
 - (i) Water content.
 - (ii) Chloride content.
 - (iii) Bearing material and metal particles content.
 - (iv) Oil ageing (resistance to oxidation).
 Oil samples are to be taken under service conditions and are to be representative of the oil within the sterntube.
- (b) Oil consumption is to be recorded.
- (c) Bearing temperatures are to be recorded, (two temperature sensors or other approved arrangements are to be provided).
- (d) Facilities are to be provided for measurement of bearing wear down.
- (e) Oil glands are to be capable of being replaced without withdrawal of the screwshaft.

13.3.2 For maintenance of **SCM** notation, the records of analyses, consumption and temperature, together with wear-down readings are to be retained onboard and audited annually.

13.3.3 Where the notation **SCM** has been assigned the screwshaft need not be withdrawn at surveys as required by 13.2.1 provided all condition monitoring data is found to be within permissible limits and all exposed areas of the shaft are examined by a magnetic particle crack detection method. The remaining requirements of 13.2.1 are to be complied with. Where the Surveyor considers that the data presented is not entirely to his satisfaction the shaft will be required to be withdrawn in accordance with 13.2.1.

13.4 Modified Survey

13.4.1 A Modified Survey may be accepted at alternate six-yearly surveys for shafts described in 13.1.1 provided they are fitted with oil lubricated bearings and approved oil glands, and also for those in 13.1.2 and 13.1.3.

13.4.2 The Modified Survey is to consist of the partial withdrawal of the shaft, sufficient to ascertain the condition of the stern bearing and shaft in way. For keyless propellers or shafts with a solid flange connection to the propeller a visual examination to confirm the good condition of the sealing arrangements is to be made. The oil glands are to be capable of being replaced without removal of the propeller. The forward bearing and all accessible parts including the propeller connection to the shaft are to be examined as far as possible. Wear down is to be measured and found satisfactory. Where a controllable pitch propeller is fitted, at least one of the blades is to be dismantled complete for examination of the working parts and the control gear.

13.4.3 For keyed propellers, the after end of the cylindrical part of the shaft and forward one third of the shaft cone is to be examined by a magnetic particle crack detection method, for which dismantling of the propeller and removal of the key will be required.

13.4.4 Where the notation **SCM** has been assigned as described in 13.3.1 and all data is found to be within permissible limits, partial withdrawal of the shaft may not be required. Where doubt exists regarding any of the above findings the shaft is to be withdrawn to permit an entire examination.

13.5 Partial Survey

13.5.1 For shafts where the Modified Survey is applicable, upon application by the Owner, LR will be prepared to give consideration to postponement of the survey for a maximum period of half the specified cycle provided a Partial Survey is held.

13.5.2 The Partial Survey is to consist of the propeller being backed off in any keyed shaft and the top half of the cone examined by an efficient crack detection method for which removal of the key will be required. Oil gland and seals are to be examined and dealt with as necessary. Wear down is to be measured and found satisfactory. Propeller and fastenings are to be examined.

13.5.3 LR will be prepared to give consideration to the circumstances of any special case upon application by the Owner.

Section 14 Hull planned maintenance, HPMS

14.1 Introduction

14.1.1 Within the scope of Ch 2,4.5.12 an approved Hull Planned Maintenance Scheme (HPMS) can be accepted as an integral part of LR's Continuous Survey (CSH) cycle.

14.1.2 The following improved facilities for dealing with hull structural surveys are provided through adoption of the Hull Planned Maintenance Scheme:

- (a) A more flexible approach to dealing with Classification Surveys of selected hull structural items. Opening out for Classification inspection is restricted to mandatory items and to verify the efficiency of the scheme through annual and periodical audits. The condition as observed and reported by the ship's LR authorised staff will, subject to Annual Audit, be sufficient to credit the items for survey.
- (b) The Navy can operate a single system, covering maintenance, spare parts/consumables supply and survey requirements for both hull and machinery items. The level of documentation and control will demonstrate a commitment to any Naval Authority requirements.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Section 14

14.1.3 The Hull Planned Maintenance Scheme will operate by allowing LR authorised personnel to carry out inspections of selected hull items to an approved schedule of inspections over a six-year period corresponding to the naval ship classification cycles. Ships currently undertaking classification surveys by either SS or CSH regimes may be accepted onto the Scheme. In order to implement the scheme it will be necessary to divide the items selected for ship's staff inspection into a programme similar to that required for CSH in which approximately 17 per cent of hull master list items are inspected each year. In preparing this schedule of inspections, due account should be taken of the items still required to be surveyed by an LR Surveyor such that these may be conveniently carried out at the time of the Annual Audit or on completion of the CSH classification cycle.

14.2 Master list Items

14.2.1 A list of typical hull master list items that can be surveyed by authorised personnel, and those items that remain to be dealt with by LR Surveyors, can be obtained from LR's London Office. It should be noted that LR will continue to inspect, as necessary, where there is a history of structural defects in a particular area, either on the ship or on a similar ship.

14.2.2 Where protective coating condition has been found to be poor or where substantial corrosion is identified in a tank or space scheduled for inspection by the ship's staff, a Memorandum will be imposed requiring that area to be examined and gauged at Annual Surveys by an LR Surveyor. Notwithstanding this requirement, the tank or space in question may continue to be inspected by the ship's staff subject to the agreement of the Scheme Manager.

14.3 Scheme Approval

14.3.1 It is recognised that planned maintenance systems may take various forms; the type of maintenance control, the scheduling, reporting and recording methods can only be decided by the Navy, having due regard to all the factors involved.

14.3.2 Approval of the planned maintenance scheme involves approval of the overall approach to maintenance for each installation, not just approval of the planned maintenance software. The amount of information to be submitted, however, can be reduced if the planned maintenance software has been approved using LR's *Software Conformity Assessment Scheme*. Further details can be obtained from LR's local offices.

14.3.3 Operational requirements for the approval of Hull Planned Maintenance Schemes are as follows:

- (a) Ship to be operating the Continuous Survey Cycle for Hull (**CSH**). (Where the Naval Authority requirements preclude the operation of the ship on a continuous hull survey, an alternative arrangement of 'modified' Special Survey will be employed.)
- (b) Ship to be operating an approved Machinery Planned Maintenance Scheme.

- (c) All personnel operating the scheme to hold a valid LR *Certificate of Authorisation*.
- (d) The language of the scheme is to be English.
- (e) The scheme is to be based on a computerised system and should have back-up devices, which are to be updated at regular intervals.
- (f) Access to computerised systems for updating of the maintenance documentation and maintenance programme shall only be permitted by personnel with a valid LR *Certificate of Authorisation*.
- (g) Approval of the scheme is required to be reconsidered if ownership or management of the ship changes.

14.3.4 Details to be submitted:

- (a) A description of the scheme regarding its application on board ship and the proposed flow of maintenance documents and method of filing.
- (b) A numbered index of the items is to be included in the scheme. This index is to include at least all hull items that appear on the 'Master List of Surveyable Items'. The scheme may also cover items that are not required for classification. The indexing system is to be such that ready cross-reference to the Master List numbers can be made.
- (c) Sample job descriptions, and the time schedules for each item, are to be provided. Maintenance descriptions are to cover at least the minimum work necessary to demonstrate that a satisfactory examination of the item will be made. The extent of the work to be undertaken is to be indicated but it is not necessary for approval purposes to include every detailed job description. A selection of sample job descriptions will suffice to demonstrate how the system works.
- (d) The reporting and recording procedures are to be sufficiently comprehensive to demonstrate that both the Navy and the LR Surveyor can verify correct operation of the planned maintenance scheme at the time of the Annual Audit. There is to be a system for reporting the following information to Navy and recording on board ship and at the Navy's headquarters:
 - details of inspections carried out;
 - the condition as found;
 - any repairs or maintenance undertaken.
- (e) The details of items inspected may be supplemented with digital photographs. These may be stored within the planned maintenance software or in a clearly distinguished and labelled electronic file system.

14.3.5 Where a ship is already operating an SS classification regime it will be necessary for the survey cycle to be converted to a CSH regime. Adoption of the scheme is best effected at the commencement of the next SS/CSH classification cycle. However, where a Navy wishes to enter the scheme in mid cycle this can be achieved by the following methods:

- (a) Entry up to 2nd Annual Survey:
all hull master list items will require to be dealt with between date of entry and the SS/CSH due date;
- (b) Entry following 2nd Annual Survey:
at least 17 per cent of the hull master list items to be dealt with in each full year of the SS/CSH cycle remaining, part years to be dealt with pro rata. The balance of hull master list items to complete the SS/CSH cycle will be dealt with by the LR Surveyor at SS/CSH due date.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Section 14

14.3.6 Where entry is effected following the 2nd Annual Survey, the Navy may choose to deal with more than the minimum number of items as indicated above, in which case the number of items remaining to be dealt with by the LR Surveyor to complete the SS/CSH cycle can be reduced accordingly.

14.4 Roles and Responsibilities

14.4.1 **Navy.** The Navy should make a request for approval of the planned maintenance scheme either through a local LR office or direct to the London office. The information detailed in 14.3.4 should be submitted. Requests for approval of planned maintenance software in accordance with LR's *Software Conformity Assessment Scheme* should be made to a local LR office or direct to the London office.

14.4.2 **Lloyd's Register.** The planned maintenance scheme will be reviewed and, if acceptable, a *Certificate of Operation* of an Approved Planned Maintenance Scheme for Hull Structures will be issued to the Navy. A copy of the Certificate is to be retained on board the subject ship for the information of the Commanding Officer, Marine Engineer Officer and LR's Surveyors. The **HPMS** notation will be assigned if requested and an appropriate memoranda item entered on the ship's survey status. The *Certificate of Operation* will be valid until the end of the classification cycle and, on completion of a satisfactory audit, the attending Surveyor will reissue the certificate.

14.4.3 **Lloyd's Register Scheme Manager.** A Scheme Manager will be appointed by LR for each Navy with ships operating the Hull Planned Maintenance Scheme. The Scheme Manager will administer the scheme on an individual ship or group basis, act as a technical consultant to the Navy and train the ships' staff in the methods of hull structural inspection and reporting. He/she will be resident in either a terminal port that the ship uses regularly or the LR office that manages the Navy's account. More details are given in the following paragraphs:

(a) Scheme Set-up

The Scheme Manager will, on obtaining a request from a Navy to include a ship on the Scheme:

- Identify the ship(s) to be assessed with the Navy.
- Contact LR's London Office for any special requirements. For example there may be specific areas where LR will not credit inspections by a ship's staff due to a history of defects.
- Guide the Navy through completion of the Hull Planned Maintenance Scheme implementation checklist and application form.
- Review ship's Master List of surveyable items to determine which items will be inspected by the ship's staff.
- Liaise with the Navy to determine a schedule of inspections to include the items to be inspected by a ship's staff and taking due account of the items still required to be surveyed by an LR Surveyor.
- Obtain scheme approval from LR's London Office.
- Issue certification for the ship (i.e. *Certificate of Operation*).

(b) Training

The Scheme Manager will carry out the following actions associated with training:

- Prepare training documentation and training workshops.
- Deliver training to the ship's staff and issue certification (i.e. *Certificate of Authorisation*).
- Maintain the database of authorised ship's officers, available through CDLive.
- Arrange for refresher training programmes for the ships' staff at 6 yearly intervals.

(c) Scheme Operation

During operation, the Scheme Manager will act as the primary contact for Hull Planned Maintenance issues:

- Confirm operation of the scheme through contact with the Navy's office.
- Review and process ship's staff reports.
- Perform, where practicable, shipboard Annual Audit of the scheme.
- Where the shipboard Annual Audit is undertaken through another LR office, act as liaison and contact point for the local LR Surveyor.
- To assess progress of the scheme at the end of each survey cycle and report to London Office and the Navy. Undertake a review at the end of the second survey cycle, i.e. when the ship is 12 years of age, and, if applicable, make a recommendation to the Classification Group in London that the ship be considered for extension of the scheme into the third cycle.

14.4.4 **Authorised Ship's Personnel.** Authorised ship's personnel will carry out inspections of the hull structural items for which they are authorised, at sea or in port, whichever is the most convenient. Inspections of individual master list items are required to be carried out in accordance with the applicable requirements of LR's Rules for Naval Ships. The Commanding Officer and Navy should arrange for LR's Surveyors to carry out an Annual Audit of the hull maintenance records. Annual audits are to be held within three months before or after the due date and are to be harmonised with the Annual Classification Survey. Items to be credited for Class can be CSH items that have become due in the previous 12 months. In the case of new ships on their first survey cycle, approximately 17 per cent of the total number of CSH items are to be selected.

14.4.5 Requirements of the Intermediate Special Survey (ITSS) will still require to be satisfied, as applicable. Master list items dealt with by the ship's staff in the 12 months prior to ITSS may be considered for credit towards this survey and may not need to be re-examined by the LR Surveyor unless required as part of the Annual Audit.

14.4.6 At the Annual Audit, the maintenance records and associated documentation are to be made available, which should include:

- Inspection and maintenance records for each item to be credited for Class. These records should give details of any repairs carried out.
- Written details of any breakdown, malfunction or defect in hull structure. Such details should include the main cause of failure.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Sections 14 & 15

- An LR *Certificate of Authorisation* for all authorised personnel who have carried out maintenance work on items to be credited for Class.
- An LR *Certificate of Operation* of an Approved Planned Maintenance Scheme for Hull Structures.
- Confirmation of the type of planned maintenance software in use.
- Reports will be required to be forwarded to the Scheme Manager on a 3-monthly basis.

14.4.7 Lloyd's Register Surveyors. At the Annual Audit held concurrently with the Annual Classification Survey, the hull records and documentation will be examined in sufficient depth by the LR Surveyors to ensure that the scheme has been operated correctly and that structure and coatings/corrosion prevention systems have functioned satisfactorily since the previous Audit. The records should indicate that all scheduled maintenance has been carried out. Any items not dealt with as per the schedule will be discussed with the authorised personnel.

14.4.8 As part of the Audit the LR Surveyors may carry out a general examination of the hull structural items completed in the previous year. If the Surveyor is not satisfied with any aspect of the scheme's operation he/she may request that items be opened out for inspection.

14.4.9 If deficiencies in the operation of the scheme are identified, either from the maintenance records or from the general condition of the ship, the Surveyors may advise that a further Audit will be required and impose a suitable Condition of Class. In the event of serious deficiencies, a report will be forwarded to the Naval Ship Classification Committee in London recommending that the special arrangements for dealing with hull structural surveys be suspended.

14.4.10 The dates of items to be credited for Class will be aligned to the date of the Annual Audit, regardless of when the survey was carried out by the ship's staff. Any other surveyable items of hull structure not covered by the Scheme will be surveyed and credited in the normal way.

14.4.11 It should be noted that when items that the ship's staff are authorised to survey become due for survey between Annual Audits, they will be shown as 'OVERDUE' on the survey status until the Annual Audit has been held and reported.

14.4.12 Items approved for inspection by the ship's staff, but not inspected by them between Annual Audits according to the approved schedule of inspections, will require to be examined by the LR Surveyor at the time of the Annual Audit.

14.4.13 Inspection Results and Reporting. Results of the inspections carried out by authorised ship's staff in accordance with the approved schedule of inspection should be recorded on the report forms provided by LR and transmitted to the Scheme Manager at the required intervals. Where previously agreed with the Scheme Manager, alternative methods of reporting may be accepted.

14.4.14 Should the authorised ship's staff, during the course of their inspections, identify any defect or damage which could invalidate the conditions of Class for which a vessel has been assigned, this should be reported to LR without delay. In such cases, an LR Surveyor should be requested to attend the ship to carry out an appropriate survey in accordance with normal practice. All repairs that may be required in order for the ship to maintain Class are to be carried out to the satisfaction of an LR Surveyor. When repairs are effected at a port, terminal or location where the services of an LR Surveyor are not available, the repairs are to be surveyed by an LR Surveyor at the earliest opportunity thereafter.

■ Section 15 Machinery planned maintenance and condition monitoring, MPMS, MCM and RCM

15.1 Introduction

15.1.1 Within the scope of Ch 2,4.5.18 and 4.5.19, an approved Planned Maintenance Scheme (**MPMS**) and Condition Monitoring (**MCM**) can be accepted as an integral part of LR's Continuous Survey Machinery (**CSM**) cycle.

15.1.2 Planned maintenance systems may be based on calendar or running hours calling for items to be opened out for inspection and overhaul at specified periods. Alternatively the machinery may be monitored for condition and performance, whereby items need only be opened out for examination when readings indicate deterioration.

15.1.3 Navies who operate a planned maintenance scheme that meet the LR requirements will benefit from enhanced arrangements for dealing with machinery surveys. The arrangements provide the following advantages:

- A more flexible approach to dealing with Classification Surveys of machinery items. The condition as observed and reported by LR approved Marine Engineer Officer will, subject to annual audit, be sufficient to credit the items for survey.
- A single system can be operated by the Navy covering maintenance, spare parts supply and survey requirements.
- The schemes allow the application of condition monitoring techniques to main and auxiliary items of machinery.

15.1.4 When a Navy decides to apply such arrangements to limit the opening out normally required for survey under **CSM** then **MPMS**, **MCM** (including Condition Monitoring) or **RCM** (including Reliability Centred Maintenance) class notations can be assigned where the schemes have been approved by LR.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Section 15

15.2 Master list items

15.2.1 A list of typical machinery master list items that can be surveyed by authorised personnel and those items that remain to be dealt with by LR Surveyors can be obtained from LR's London Office. It should be noted that LR will continue to inspect, as necessary, where there is a history of mechanical, electrical or control engineering defects in a particular area, either on the ship or on a similar ship.

15.3 The planned maintenance approach

15.3.1 Types of maintenance are defined as:

- (a) **Preventive maintenance.** This calls for items to be opened out for inspection and overhaul at specified time periods or after a specified number of running hours in order to keep the machine/equipment/system in a satisfactory operational condition.
- (b) **Condition based maintenance.** This is dictated by the performance or physical state of the machine/equipment/system, determined by regular or continuous checks of applicable parameters. Maintenance is only undertaken when conditions have approached or reached the lowest acceptable standard and before breakdown or failure occurs.
- (c) **Reliability centred maintenance.** This calls for a structured analysis of a system's capability to perform its functions from design through operation to decommissioning. The primary objective is to ensure the functionality of a system and this is achieved through a planned maintenance strategy determined from the detailed analysis. The strategy may include the use of prevention and condition based maintenance.

15.3.2 The types of maintenance described in 15.3.1 are the foundations of a Machinery Planned Maintenance System acceptable to LR. Many schemes are made up with a combination of the three methods of control. In addition, to deal with unforeseen circumstances, any Machinery Planned Maintenance System must also be able to deal effectively with breakdown or corrective maintenance, i.e. unscheduled maintenance.

15.4 Basic requirements for approval of MPMS, MCM and RCM schemes

15.4.1 To obtain approval of a **MPMS**, the Navy is required to make a formal request through either a local office of LR or direct to LR in London. The request is to be accompanied by the following information:

- (a) A numbered index of the items to be included in the scheme. This index is to include at least all **CSM** items that appear on the Master List of Surveyable Items. The scheme can also cover many items that are not required for classification. The indexing system is to be such that ready cross-reference to the numbers in the LR Master List of Surveyable items can be made. It is also to indicate those items to be dealt with by preventive maintenance, by condition based maintenance and by reliability centred maintenance.

- (b) The maintenance and monitoring methods to be used, the time schedules for each item and limits of acceptance/condition where applicable. Maintenance descriptions are to cover at least the minimum opening out necessary to demonstrate that a satisfactory examination of the item will be made. The extent of the work to be undertaken is to be indicated but it is not necessary for approval purposes to include every detailed job description. A few sample job descriptions will suffice to demonstrate how the system works. Machinery on preventive maintenance must be examined completely for survey purposes at intervals not exceeding six years, although in practice many items will be maintained much more frequently.
- (c) A system for reporting to the Navy and recording on board ship and at the Navy's headquarters, details of maintenance carried out, the condition as found and any repairs effected, together with a list of spare parts used. The reporting and recording procedures are to be sufficiently comprehensive to demonstrate that both the Navy and the LR Surveyor can verify correct operation of the planned maintenance system at the time of the survey.
- (d) A description of the scheme regarding its application on board ship and the proposed flow of maintenance documents and method of filing same. The application of the scheme may take the form of simple planning charts or the more complex interactive computer based systems. The language of the **MPMS** is to be English.

15.4.2 Where a Navy has requested approval of a Reliability Centred Maintenance study, the requirements of 15.4.3 to 15.4.5 are to be complied with.

15.4.3 The following information is to be submitted to LR for review:

- (a) Hard or soft copy (with operating systems if necessary) of the studies. This is to include, operating context, details of study team, FMECA, algorithm decision sheets, summary of maintenance tasks, summary of 'level of repair analysis', identification of 'critical' spares.
- (b) Details of system/equipment covered by the study.
- (c) Copy of acceptance letter from equipment manufacturer confirming their review of the study details.

15.4.4 LR will verify by audit that the following items have been complied with:

- (a) Study has been undertaken in full compliance of the methodology embodied in an acceptable and applicable standard for **RCM**.
- (b) Study team members have adequate experience both of undertaking **RCM** studies and the systems/equipment under review.
- (c) Study team members have been present during the study for sufficient time (% of total time taken) to properly contribute to the study.
- (d) No 'Mandatory Redesign' requirements are outstanding.
- (e) Where spares have been identified as 'Critical', they have been properly identified in the management systems on board.
- (f) Procedures for collection of condition monitoring information have been established and reporting procedures for submission of this as part of the approved **MPMS** are clearly documented.

- (g) Where Standard Operating Procedures have been identified, that an adequate management system is in place to ensure that they are complied with.
- (h) The FMECA is in compliance with an acceptable standard, good marine engineering practice and application of valid reliability data.

15.4.5 A technical audit by LR of individual **RCM** studies selected by LR will follow the following methodology:

- (a) Verification that the study covers the entire function being addressed.
- (b) For each individual study (sub function) within a group function, verification that there is a list that includes the individual assets items, including controls, instrumentation and protective/emergency devices.
- (c) Verification that an expected maintenance task list has been drafted, based on typical tasks that would be expected for the relevant item, under any maintenance regime. These would include, but may not be limited too, system performance analysis checks, standard condition monitoring checks (vibration, electrical characteristics, thermography, etc), inspections of items liable to wear or other age related degradation, i.e. fouling, periodic tests of protective devices, operation of reversionary modes of operation, etc.
- (d) Confirm that the standard tasks have been identified for each sub function.
- (e) Review the study for justification for items or systems with no scheduled maintenance for tasks not identified.
- (f) Review any inconsistencies in periodicity for tasks included in maintenance schedule.
- (g) Carry out a review of RCM logic applied for one sub function. If the review is acceptable and in accordance with the standard for RCM, others will not be fully reviewed. If considered unacceptable, a review of another will be carried out for confirmation. If second also unacceptable, LR will require a complete review of all other sub functions for acceptance.
- (h) Review LR Master List Surveyable items to verify that all Class items have a maintenance programme associated with credit as part of RCM.

15.4.6 As an alternative to LR carrying out post study audits required by 15.4.4 and 15.4.5, LR can, if requested provide direct input and advice to the study team(s) on either full or part time basis to supplement the technical/survey requirement input. If this is undertaken, the scope of the audit will be reduced accordingly.

15.4.7 Where machinery items are maintained on a condition basis the following additional information is required to be submitted:

- (a) A description of the applicable monitoring techniques and monitoring equipment to be used.
- (b) A statement as to the acceptable limits of deteriorated condition. These should be derived from the manufacturer's recommendations, applicable severity criteria as defined in recognised Standards, or the Navy's required limits when these are more severe. Rotating machinery on condition based maintenance may be accepted for survey on the basis of the monitored readings without opening out if the condition is shown to be good.

15.4.8 If the planned maintenance scheme is considered to be acceptable to LR a 'Certificate for Operation of an Approved Planned Maintenance Scheme' will be issued. The Certificate is to be retained on board the subject ship for the information of the Commanding Officer, Marine Engineer Officer and LR's Surveyors.

15.4.9 The Marine Engineer Officer operating the Scheme on a ship must hold a valid LR Certificate of Authorisation.

15.5 Conditions of operation

15.5.1 It is a condition of the Scheme that the Navy arranges for LR Surveyors to carry out an Annual audit of the machinery maintenance and monitoring records. Annual audits are to be held within three months before or after the due date and it is recommended that they are harmonised with the ship's Annual Survey.

15.5.2 Marine Engineer Officers may carry out surveys of all the machinery items for which they are authorised, at sea or in port, whichever is the most convenient. The following machinery items remain to be dealt with by an LR Surveyor, unless special arrangements have been agreed with the Navy:

- Machinery damage, repairs and alterations, see 15.6.
- Gas turbines for propulsion and electrical supplies.
- Oil engines for propulsion and electrical supplies.
- Steam turbines and boilers for propulsion and electrical supplies.
- Control, alarm and safety devices associated with the above main and auxiliary machinery.
- Reduction/increase gearing, flexible couplings and clutches.
- Holding down bolts and chocks.
- Steam pipes and valves on ships with steam turbine installations.
- Air receivers and other pressure vessels.
- Starting air pipes.
- Steering machinery.
- Pumping arrangements for bilge and dewatering systems.
- Electrical equipment other than auxiliary motors.
- Screwshafts, stern bearings and propellers.
- Sea connections.
- Machinery controls and controls associated with Class Notations, e.g. **UMS**, **CCS**, **ICC**, **IP** and **DP**.
- Engine Trial.
- First start arrangement trial.

15.5.3 The confirmatory survey carried out at the time of the annual audit by LR's Surveyor will comprise of checks of the condition monitoring records and, if considered necessary, an examination of selected main and auxiliary machinery under working conditions.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Sections 15 & 16

15.6 Breakdown or corrective maintenance

15.6.1 LR is required to be notified when a breakdown or defect occurs and has a major effect that affects the Provisions of Classification and repairs are necessary. A major effect is an effect that produces:

- (a) a significant increase in the operational duties of the crew or in their difficulty in performing their duties which by itself should not be outside the capability of a competent crew provided that another major effect does not occur at the same time; or
- (b) significant degradation in the operational capability of the ship; or
- (c) significant modification of the permissible operating conditions, but will not remove the capability to complete a safe journey without demanding more than normal skill on the part of the operating crew.

15.6.2 In discussion with the Navy and the Marine Engineer Officer, LR will advise what repairs and/or renewals are necessary for classification purposes, with the issue of an Interim Certificate of Class.

15.6.3 The required repair and time scale for completion will be the subject of discussion and agreement with LR and the Navy. It is the responsibility of the Navy to decide whether the ship's mission/operational tasking is more important than completing the repairs within the agreed time. It is accepted that such circumstances are occasionally inevitable, and LR would provide advice on the interim measures that could be introduced until such times as the required repairs are carried out and the implications on a ship's operating capability of delays in affecting repairs.

15.7 Annual audit and survey

15.7.1 At the annual audit the Marine Engineer Officer is required to make available the maintenance and monitoring records. These records may be in a hard or soft format and should include:

- (a) Appropriate records of machinery or equipment surveyed under the supervision of the Marine Engineer Officer that are listed in the Master List of Surveyable Items. These statements should give details of repairs carried out and spare parts used.
- (b) Written details of any breakdown or malfunction of essential machinery. Such details should include the main cause of failure.
- (c) LR Certificate(s) of Authorisation for the Marine Engineer Officer(s) responsible for surveys during the period.

These records will be examined in sufficient depth by the LR Surveyors to ensure that the scheme has been correctly operated and that the machinery has functioned satisfactorily since the previous survey. The records should indicate that all scheduled maintenance has been carried out. Any items not dealt with as per schedule will be discussed with the Marine Engineer Officer.

15.7.2 Where condition monitoring of main or auxiliary machinery is incorporated in the PMS the LR Surveyor will examine the records to verify that vibration levels, performance criteria, etc., are within the approved specified limits. The LR Surveyor may require confirmatory readings on available running machinery to be taken for comparison with the ship's records.

15.7.3 As part of the audit, LR Surveyors carry out a general examination of the machinery. As far as is practicable machinery to be credited for survey will be examined under working conditions. If the LR Surveyor is not satisfied with the condition as found he might require to have any items opened out for inspection.

15.7.4 The dates of items to be credited for Class will be aligned to the date of the confirmatory survey regardless of when the Marine Engineer Officer carried out his survey. Any other surveyable items of machinery not covered by the Scheme will be surveyed and credited in the normal way.

15.7.5 For items which the Marine Engineer Officer is authorised to survey and become due for survey between Annual Audits these will be shown as 'OVERDUE' on the survey status until the Annual Audit has been held and reported.

15.7.6 In the event of the Surveyor not being satisfied that the planned maintenance scheme is being correctly followed, either from the maintenance records or from the general condition of the machinery, a report will be forwarded to LR recommending that the special arrangements for dealing with machinery surveys be suspended.

Section 16 Classification of ships not built under LR survey

16.1 General

16.1.1 When classification is desired for a ship not built under the supervision of LR Surveyors, application should be made in writing.

16.1.2 Periodical Surveys of such ships, when classed, are subsequently to be held as in the case of ships built under survey.

16.1.3 Where classification is desired for a ship which has not been designed, constructed and maintained to appropriate standards recognised by the Naval Authority, special consideration will be given to the requirements of this Section.

16.1.4 Where classification is desired for a ship which is classed by another recognised Society, special consideration will be given to the requirements of this Section.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Section 16

16.2 Hull and equipment

16.2.1 Plans showing the main scantlings, corrosion margins and arrangements of the actual ship together with any proposed alterations are to be submitted. Documents demonstrating compliance with appropriate standards recognised by the Naval Authority are to be submitted. In the absence of such documentation, an appraisal may be required to the satisfaction of LR. These should comprise plans of the midship section, longitudinal section and decks, and such other plans as may be requested. If plans cannot be obtained or prepared by the Owner, facilities are to be given for LR's Surveyor to obtain the necessary information from the ship.

16.2.2 Particulars of the process of manufacture and the testing of the material of construction are to be supplied. The requirements for composite ships will be specially considered.

16.2.3 The full requirements of Sections 5 and 6 are to be carried out as applicable. Ships of recent construction will receive special consideration.

16.2.4 During the survey, the Surveyors are to satisfy themselves regarding the workmanship and verify the approved scantlings and arrangements. For this purpose, and also in order to ascertain the amount of any deterioration of a steel ship, parts of the structure will require to be gauged as necessary. Full particulars of the anchors, chain cables and equipment are to be submitted.

16.2.5 When the full survey requirements indicated in 16.2.3 and 16.2.4 cannot be completed at one time, LR may consider granting an interim record for a limited period. The conditions regarding the completion of the survey will depend on the merit of each particular case, which should be submitted for consideration.

16.3 Machinery

16.3.1 To facilitate the survey, plans of the following items (plans of piping are to be diagrammatic), together with the particulars of the materials used in the construction of the boilers, air receivers and important forgings are to be furnished:

General piping system arrangements, including air and sounding pipes (Builder's plan).
 Bilge, dewatering, ballast and oil fuel piping arrangements including the capacities of the pumps on bilge service.
 Arrangement and dimensions of main steam pipes.
 Arrangement of oil fuel pipes and fittings at settling and service tanks.
 Arrangement of oil fuel piping in connection with oil burning installations.
 Oil fuel overflow systems, where these are fitted.
 Arrangement of boiler feed systems.
 Oil fuel settling, service and other oil fuel tanks not forming part of the ship's structure.
 Boilers, superheaters and economisers.
 Air receivers.
 Crank, thrust, intermediate and screw shafting.
 Clutch and reversing gear with methods of control.

Reduction gearing.

Propeller (including spare propeller if supplied).

Electrical circuits, as listed in Vol 2, Pt 10, Ch 1, 1.2.2, 1.2.3 and 1.2.4.

Arrangement of compressed air systems for main and auxiliary services.

Arrangement of lubricating oil, hydraulic oil, thermal oil and other systems containing flammable liquids.

Arrangements of cooling water systems for main and auxiliary services.

Steering gear system and piping arrangements together with manufacturer, model and rating information.

Aircraft/helicopter and vehicle fuel storage and distribution systems.

Chilled water systems.

High pressure sea water systems.

Heating and ventilation systems.

Made and fresh water systems.

Hydraulic power actuating systems.

Propulsion engine details including manufacturer, model and rating information.

Electrical generator engine details including manufacturer, model and rating information.

For **UMS** notation the following plans are to be submitted for appraisal:

- Fire alarm system.
- Instrumentation list.
- Plans for systematic maintenance and function testing.
- Test schedule.

Where an Ice Class notation is required the following plans are to be submitted for appraisal:

- Main propulsion line shafting.
- Reduction gears.
- Propeller.
- Details of any clutch system in the propulsion line.

Replenishment at sea arrangements where a **RAS** notation is requested.

16.3.2 Plans additional to those detailed in 16.3.1 are not to be submitted unless the machinery is of a novel or special character affecting classification.

16.3.3 Where remote and/or automatic controls are fitted to propulsion machinery and essential auxiliaries, a description of the scheme is to be submitted.

16.3.4 For new ships and ships which have been in service less than two years, calculations of the torsional vibration characteristics of the propelling machinery are to be submitted for consideration, as required for ships constructed under Special Survey. For older ships the circumstances will be specially considered in relation to their service record and type of machinery installed. Where calculations are not submitted, LR may require that the machinery certificate be endorsed to this effect. When desired by the Owner, the calculations and investigation of the torsional vibration characteristics of the machinery may be carried out by LR upon special request.

Periodical Survey Regulations

Volume 1, Part 1, Chapter 3

Sections 16 & 17

16.3.5 The main and auxiliary machinery, feed pipes, compressed air pipes and boilers are to be examined as required at Complete Surveys. Working pressures are to be determined from the actual scantlings in accordance with the Rules.

16.3.6 The screwshaft is to be drawn and examined.

16.3.7 The steam pipes are to be examined and tested as required by Section 12.

16.3.8 The bilge, dewatering, ballast and oil fuel pumping arrangements are to be examined and amended, as necessary, to comply with the Rules.

16.3.9 Oil burning installations are to be examined as required at Complete Surveys and found, or modified, to comply with the requirements of the Rules; they are also to be tested under working conditions.

16.3.10 The electrical equipment is to be examined as required at Complete Surveys.

16.3.11 The whole of the machinery, including essential controls, is to be tested under working conditions to the Surveyor's satisfaction.

16.3.12 Relevant reports are to be prepared by the Surveyors.

■ Section 17 Classification of ships built under survey to LR Classification Rules and Regulations other than LR Naval Ship Rules and Regulations

17.1 General

17.1.1 When Naval ship classification is desired for an existing ship built under the supervision of LR Surveyors to Classification Rules and Regulations other than LR Naval Ship Rules, application should be made in writing.

17.1.2 Periodical Surveys of such ships, when classed to the LR Naval Ship Rules are subsequently to be held as in the case of ships built under survey to the Naval Ship Rules. All features of the extant survey regime for hull and machinery are to be included in the Survey scheme under the Naval Ship Rules.

17.2 Hull and equipment

17.2.1 Plans showing the features not covered by merchant classification are to be submitted. These may include the following which should be addressed for strength and, where appropriate, stiffness aspects:

- Masts.
- Weapon system seats.
- RAS seats, landing areas.
- Aircraft landing guides.
- Towing points.
- Military loads.
- Beaching.
- Material grades.
- Watertight integrity.
- Strength of watertight structure.

If plans cannot be obtained or prepared by the Owner, facilities are to be given for LR Surveyor to obtain the necessary information from the ship.

17.2.2 Suitable documentation should be presented to demonstrate that the following aspects are addressed by the appropriate Naval Authority:

- Stability.
- Magazine safety.
- Lifts, ramps, shell doors.
- Fire safety.

17.2.3 During the survey, the Surveyors are to satisfy themselves regarding the workmanship and verify the approved scantlings and arrangements of additional features covered by the Rules. For this purpose, and also in order to ascertain the amount of any deterioration of a steel ship, parts of the structure may need to be gauged as necessary.

17.2.4 When the full survey requirements indicated in 7.2.4 cannot be completed at one time, LR may consider granting an interim record for a limited period. The conditions regarding the completion of the survey will depend on the merit of each particular case, which should be submitted for consideration.

17.3 Machinery

17.3.1 To facilitate the assessment and survey of systems not covered by the other Classification Rules with which the ship is classed, the following information with supporting plans is to be submitted to LR:

- (a) Aircraft/helicopter and vehicle fuel storage and distribution systems.
- (b) Chilled water systems.
- (c) High pressure sea water systems.
- (d) High and low pressure compressed air systems.
- (e) Hydraulic power actuating systems.
- (f) Made and fresh water systems.
- (g) Heating, ventilation and cooling arrangements.
- (h) Replenishment at sea arrangements where a **RAS** notation is requested.

17.3.2 Details additional to those stated in 17.3.1 are not to be submitted unless the machinery or installation is of a novel or special character affecting Mobility, Ship Type or Ancillary category systems for Machinery Naval Classification.

17.3.3 The whole of the machinery, including essential controls and safety arrangements, is to be tested to an agreed test plan under working conditions to the Surveyor's satisfaction.

17.3.4 Relevant reports on the submitted information and testing are to be prepared by the Surveyors.

RULES FOR THE MANUFACTURE, TESTING AND CERTIFICATION OF MATERIALS

JULY 2009

A guide to the Rules

and published requirements

Rules for the Manufacture, Testing and Certification of Materials

Introduction

The Rules are published as a complete set, individual Parts are, however, available on request. A comprehensive List of Contents is placed at the beginning of each Part.

Numbering and Cross-References

A decimal notation system has been adopted throughout. Five sets of digits cover the divisions, i.e. Part, Chapter, Section, sub-Section and paragraph. The textual cross-referencing within the text is as follows, although the right hand digits may be added or omitted depending on the degree of precision required:

- (a) In same Chapter, e.g. see 2.1.3 (i.e. down to paragraph).
- (b) In another set of Lloyd's Register Rules, e.g. see Pt 5, Ch 3,2.1 of the Rules and Regulations for the Classification of Ships.

The cross-referencing for Figures and Tables is as follows:

- (a) In same Chapter, e.g. as shown in Fig 2.3.5 (i.e. Chapter, Section and Figure Number).
- (b) In another set of Lloyd's Register Rules, e.g. see Table 2.7.1 in Pt 3, Ch 2 of the Rules and Regulations for the Classification of Special Service Craft.

Rules updating

The Rules are generally published annually and changed through a system of Notices. Subscribers are forwarded copies of such Notices when the Rules change.

Current changes to Rules that appeared in Notices are shown with a black rule alongside the amended paragraph on the left hand side. A solid black rule indicates amendments and a dotted black rule indicates corrigenda.

July 2009

Lloyd's Register is an exempt charity under the UK Charities Act 1993

Lloyd's Register, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as the 'Lloyd's Register Group'. The Lloyd's Register Group assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register Group entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

Section	8	Plates with specified through thickness properties
	8.1	Scope
	8.2	Manufacture
	8.3	Test material
	8.4	Mechanical tests
	8.5	Non-destructive examination
	8.6	Identification of materials
	8.7	Certification
Section	9	Bars for welded chain cables
	9.1	Scope
	9.2	Manufacture
	9.3	Chemical composition
	9.4	Heat treatment
	9.5	Embrittlement tests
	9.6	Mechanical tests
	9.7	Dimensional tolerances
	9.8	Non-destructive examination
	9.9	Identification
	9.10	Certification
Section	10	High strength quenched and tempered steels for welded structures
	10.1	Scope
	10.2	Manufacture and chemical composition
	10.3	Mechanical properties
	10.4	Identification of materials
	10.5	Certification of materials
CHAPTER	4	STEEL CASTINGS
Section	1	General requirements
	1.1	Scope
	1.2	Manufacture
	1.3	Quality of castings
	1.4	Chemical composition
	1.5	Heat treatment
	1.6	Test material and test specimens
	1.7	Visual and non-destructive examination
	1.8	Pressure testing
	1.9	Rectification of defective castings
	1.10	Identification of castings
	1.11	Certification

Section	2	Castings for ship and other structural applications
	2.1	Scope
	2.2	Chemical composition
	2.3	Heat treatment
	2.4	Mechanical tests
	2.5	Non-destructive examination
Section	3	Castings for machinery construction
	3.1	Scope
	3.2	Chemical composition
	3.3	Heat treatment
	3.4	Mechanical tests
	3.5	Non-destructive examination
Section	4	Castings for crankshafts
	4.1	Scope
	4.2	Manufacture
	4.3	Chemical composition
	4.4	Heat treatment
	4.5	Mechanical tests
	4.6	Non-destructive examination
	4.7	Rectification of defective castings
Section	5	Castings for propellers
	5.1	Scope
	5.2	Chemical composition
	5.3	Heat treatment
	5.4	Mechanical tests
	5.5	Non-destructive examination
	5.6	Rectification of defective castings
	5.7	Identification
	5.8	Certification
Section	6	Castings for boilers, pressure vessels and piping systems
	6.1	Scope
	6.2	Chemical composition
	6.3	Heat treatment
	6.4	Mechanical tests
	6.5	Non-destructive examination
	6.6	Mechanical properties for design purposes
Section	7	Ferritic steel castings for low temperature service
	7.1	Scope
	7.2	Chemical composition
	7.3	Heat treatment
	7.4	Mechanical tests
	7.5	Non-destructive examination
Section	8	Stainless steel castings
	8.1	Scope
	8.2	Chemical composition
	8.3	Heat treatment
	8.4	Mechanical tests
	8.5	Intergranular corrosion tests
	8.6	Non-destructive examination

Section	9	Steel castings for container corner fittings
	9.1	General
	9.2	Chemical composition
	9.3	Heat treatment
	9.4	Mechanical tests
	9.5	Non-destructive examination
	9.6	Repair of defects
	9.7	Identification
	9.8	Certification
 CHAPTER	 5	 STEEL FORGINGS
Section	1	General requirements
	1.1	Scope
	1.2	Manufacture
	1.3	Quality
	1.4	Chemical composition
	1.5	Heat treatment
	1.6	Test material
	1.7	Mechanical tests
	1.8	Visual and non-destructive examination
	1.9	Rectification of defects
	1.10	Identification
	1.11	Certification
 Section	 2	 Forgings for ship and other structural applications
	2.1	Scope
	2.2	Chemical composition
	2.3	Heat treatment
	2.4	Mechanical tests
 Section	 3	 Forgings for shafting and machinery
	3.1	Scope
	3.2	Chemical composition
	3.3	Heat treatment
	3.4	Mechanical tests
	3.5	Non-destructive examination
 Section	 4	 Forgings for crankshafts
	4.1	Scope
	4.2	Manufacture
	4.3	Chemical composition
	4.4	Heat treatment
	4.5	Mechanical tests
	4.6	Non-destructive examination
 Section	 5	 Forgings for gearing
	5.1	Scope
	5.2	Manufacture
	5.3	Chemical composition
	5.4	Heat treatment
	5.5	Mechanical tests for through hardened, induction hardened or nitrided forgings
	5.6	Mechanical tests for carburised forgings
	5.7	Non-destructive examination
 Section	 6	 Forgings for turbines
	6.1	Scope
	6.2	Manufacture
	6.3	Chemical composition
	6.4	Heat treatment
	6.5	Mechanical tests
	6.6	Non-destructive examination
	6.7	Thermal stability tests

Section	7	Forgings for boilers, pressure vessels and piping systems
	7.1	Scope
	7.2	Chemical composition
	7.3	Heat treatment
	7.4	Mechanical tests
	7.5	Non-destructive examination
	7.6	Pressure tests
	7.7	Mechanical properties for design purposes
Section	8	Ferritic steel forgings for low temperature service
	8.1	Scope
	8.2	Chemical composition
	8.3	Heat treatment
	8.4	Mechanical tests
	8.5	Non-destructive examination
	8.6	Pressure tests
Section	9	Austenitic stainless steel forgings
	9.1	General
	9.2	Mechanical properties for design purposes
	9.3	Non-destructive examination
	9.4	Intergranular corrosion tests
CHAPTER	6	STEEL PIPES AND TUBES
Section	1	General requirements
	1.1	Scope
	1.2	Manufacture
	1.3	Quality
	1.4	Dimensional tolerances
	1.5	Chemical composition
	1.6	Heat treatment
	1.7	Test material
	1.8	Dimensions of test specimens and test procedures
	1.9	Visual and non-destructive testing
	1.10	Hydraulic test
	1.11	Rectification of defects
	1.12	Identification
	1.13	Certification
Section	2	Seamless pressure pipes
	2.1	Scope
	2.2	Manufacture and chemical composition
	2.3	Heat treatment
	2.4	Mechanical tests
	2.5	Mechanical properties for design
Section	3	Welded pressure pipes
	3.1	Scope
	3.2	Manufacture and chemical composition
	3.3	Heat treatment
	3.4	Mechanical tests
	3.5	Mechanical properties for design
Section	4	Ferritic steel pressure pipes for low temperature service
	4.1	Scope
	4.2	Manufacture and chemical composition
	4.3	Heat treatment
	4.4	Mechanical tests

Section	5	Austenitic stainless steel pressure pipes
	5.1	Scope
	5.2	Manufacture and chemical composition
	5.3	Heat treatment
	5.4	Mechanical tests
	5.5	Intergranular corrosion tests
	5.6	Fabricated pipework
Section	6	Boiler and superheater tubes
	6.1	Scope
	6.2	Manufacture and chemical composition
	6.3	Heat treatment
	6.4	Mechanical tests
	6.5	Mechanical properties for design
CHAPTER	7	IRON CASTINGS
Section	1	General requirements
	1.1	Scope
	1.2	Manufacture
	1.3	Quality of castings
	1.4	Chemical composition
	1.5	Heat treatment
	1.6	Test material
	1.7	Mechanical tests
	1.8	Visual and non-destructive examination
	1.9	Rectification of defective castings
	1.10	Pressure testing
	1.11	Identification of castings
	1.12	Certification
Section	2	Grey iron castings
	2.1	Scope
	2.2	Test material
	2.3	Mechanical tests
Section	3	Spheroidal or nodular graphite iron castings
	3.1	Scope
	3.2	Test material
	3.3	Mechanical tests
	3.4	Metallographic examination
Section	4	Iron castings for crankshafts
	4.1	Scope
	4.2	Manufacture
	4.3	Heat treatment
	4.4	Test material
	4.5	Non-destructive examination
	4.6	Rectification of defective castings
	4.7	Certification
CHAPTER	8	ALUMINIUM ALLOYS
Section	1	Plates, bars and sections
	1.1	Scope
	1.2	Manufacture
	1.3	Quality of materials
	1.4	Dimensional tolerances
	1.5	Chemical composition
	1.6	Heat treatment
	1.7	Test material
	1.8	Mechanical tests

	1.9	Corrosion tests
	1.10	Pressure weld tests
	1.11	Visual and non-destructive examination
	1.12	Rectification of defects
	1.13	Identification
	1.14	Certification
Section	2	Aluminium alloy rivets
	2.1	Scope
	2.2	Chemical composition
	2.3	Heat treatment
	2.4	Test material
	2.5	Mechanical tests
	2.6	Tests from manufactured rivets
	2.7	Identification
	2.8	Certification
Section	3	Aluminium alloy castings
	3.1	Scope
	3.2	Manufacture
	3.3	Quality of castings
	3.4	Chemical composition
	3.5	Heat treatment
	3.6	Mechanical tests
	3.7	Visual examination
	3.8	Rectification of defective castings
	3.9	Pressure testing
	3.10	Identification
	3.11	Certification
Section	4	Aluminium/steel transition joints
	4.1	Scope
	4.2	Manufacture
	4.3	Visual and non-destructive examination
	4.4	Mechanical tests
	4.5	Identification
	4.6	Certification
CHAPTER	9	COPPER ALLOYS
Section	1	Castings for propellers
	1.1	Scope
	1.2	Manufacture
	1.3	Quality of castings
	1.4	Chemical composition
	1.5	Heat treatment
	1.6	Test material
	1.7	Mechanical tests
	1.8	Inspection and non-destructive examination
	1.9	Rectification of defective castings
	1.10	Weld repair procedure
	1.11	Identification
	1.12	Certification
Section	2	Castings for valves, liners and bushes
	2.1	Scope
	2.2	Manufacture
	2.3	Quality of castings
	2.4	Chemical composition
	2.5	Heat treatment
	2.6	Test material
	2.7	Mechanical tests
	2.8	Inspection

	2.9	Rectification of defective castings
	2.10	Pressure testing
	2.11	Identification
	2.12	Certification
Section	3	Tubes
	3.1	Scope
	3.2	Manufacture
	3.3	Quality
	3.4	Dimensional tolerances
	3.5	Chemical composition
	3.6	Heat treatment
	3.7	Mechanical tests
	3.8	Visual examination
	3.9	Stress corrosion cracking test
	3.10	Hydraulic test
	3.11	Rectification of defects
	3.12	Identification
	3.13	Certification
 CHAPTER	 10	 EQUIPMENT FOR MOORING AND ANCHORING
Section	1	Anchors
	1.1	Scope
	1.2	Manufacture
	1.3	Cast steel anchors
	1.4	Forged steel anchors
	1.5	Fabricated steel anchors
	1.6	Rectification
	1.7	High holding power (HHP) anchors
	1.8	Assembly
	1.9	Proof test of anchors
	1.10	Non-destructive testing
	1.11	Clearances and tolerances
	1.12	Identification
	1.13	Certification
 Section	 2	 Stud link chain cables for ships
	2.1	Scope
	2.2	Manufacture
	2.3	Flash butt welded chain cable
	2.4	Cast chain cables
	2.5	Forged chain cables
	2.6	Stud material
	2.7	Welding of studs
	2.8	Heat treatment of completed chain cables
	2.9	Testing of completed chain cables
	2.10	Proof load tests
	2.11	Breaking load tests
	2.12	Dimensional inspection
	2.13	Fittings for chain cables
	2.14	Substitute single links
	2.15	Dimensions and tolerances
	2.16	Identification
	2.17	Certification

Section	3	Stud link mooring chain cables
	3.1	Scope
	3.2	Manufacture
	3.3	Studs
	3.4	Heat treatment of completed chain cables
	3.5	Testing of completed chain cables
	3.6	Connecting common links or substitute links
	3.7	Fittings for offshore mooring chain
	3.8	Identification
	3.9	Certification
	3.10	Documentation
Section	4	Studless mooring chain cables
	4.1	Scope
	4.2	Manufacture
	4.3	Shape and dimensions of links
	4.4	Dimensional tolerances
	4.5	Heat treatment
	4.6	Testing of completed chain
	4.7	Connecting or substitute links
	4.8	Fittings
	4.9	Identification
	4.10	Certification
	4.11	Documentation
Section	5	Short link chain cables
	5.1	Scope
	5.2	Manufacture
	5.3	Bar material
	5.4	Testing and inspection of chain cables
	5.5	Dimensions and tolerances
	5.6	Identification
	5.7	Certification
Section	6	Steel wire ropes
	6.1	Scope
	6.2	General requirements
	6.3	Steel wire for ropes
	6.4	Tests on completed ropes
	6.5	Inspection
	6.6	Identification
	6.7	Certification
Section	7	Fibre ropes
	7.1	Manufacture
	7.2	Tests of completed ropes
	7.3	Identification
	7.4	Certification
CHAPTER	11	APPROVAL OF WELDING CONSUMABLES
Section	1	General
	1.1	Scope
	1.2	Grading
	1.3	Manufacture
	1.4	Approval procedures
	1.5	Annual inspection and tests
	1.6	Changes in grading
	1.7	Manufacturers' Quality Assurance Systems

Section	2	Mechanical testing procedures
	2.1	Dimensions of test specimens
	2.2	Testing procedures
	2.3	Re-testing procedures
Section	3	Electrodes for manual and gravity welding
	3.1	General
	3.2	Deposited metal test assemblies
	3.3	Butt weld test assemblies
	3.4	Hydrogen test
	3.5	Fillet weld test assemblies
	3.6	Electrodes designed for deep penetration welding
	3.7	Deep penetration butt weld test assemblies
	3.8	Deep penetration fillet weld test assemblies
	3.9	Electrodes designed for gravity or contact welding
	3.10	Certification
	3.11	Annual tests
Section	4	Wire-flux combinations for submerged-arc automatic welding
	4.1	General
	4.2	Approval tests for multi-run technique
	4.3	Deposited metal test assemblies (multi-run technique)
	4.4	Butt weld test assemblies (multi-run technique)
	4.5	Approval tests for two-run technique
	4.6	Butt weld test assemblies (two-run technique)
	4.7	Annual tests
Section	5	Wires and wire-gas combinations for manual, semi-automatic and automatic welding
	5.1	General
	5.2	Approval tests for manual and semi-automatic multi-run welding
	5.3	Approval tests for multi-run automatic welding
	5.4	Approval tests for two-run automatic welding
	5.5	Annual tests
Section	6	Consumables for use in electro-slag and electro-gas welding
	6.1	General
	6.2	Butt weld test assemblies
	6.3	Annual tests
Section	7	Consumables for use in one-side welding with temporary backing materials
	7.1	General
	7.2	Approval tests for manual (m), semi-automatic (S) and automatic multi-run (M) techniques
	7.3	Approval tests for high heat input automatic (A) techniques
	7.4	Annual tests
Section	8	Consumables for welding austenitic and duplex stainless steels
	8.1	General
	8.2	Deposited metal test assemblies
	8.3	Butt weld test assemblies
	8.4	Fillet weld test assemblies
	8.5	Annual tests
Section	9	Consumables for welding aluminium alloys
	9.1	General
	9.2	Approval tests for manual, semi-automatic and automatic multi-run techniques
	9.3	Deposited metal test assembly
	9.4	Butt weld test assemblies
	9.5	Fillet weld test assembly
	9.6	Approval tests for two-run technique
	9.7	Butt weld test assemblies (two-run technique)
	9.8	Annual tests

CHAPTER 12	WELDING QUALIFICATIONS
Section 1	General qualification requirements
1.1	General
1.2	Design
1.3	Materials
1.4	Performance of welding tests
Section 2	Welding Procedure Qualification Tests for Steels
2.1	General
2.2	Welding variables
2.3	Steel test assemblies
2.4	Welding of steel test assemblies
2.5	Non-destructive examination (NDE)
2.6	Destructive tests – General requirements
2.7	Destructive tests for steel butt welds
2.8	Destructive tests for steel fillet welds
2.9	Destructive tests for T, K, Y steel nozzle welds
2.10	Destructive tests for steel pipe branch welds
2.11	Destructive tests for weld cladding of steel
2.12	Mechanical test acceptance criteria for steels
2.13	Failure to meet requirements
2.14	Test records
2.15	Range of approval
2.16	Welding procedure specification (WPS)
Section 3	Specific requirements for stainless steels
3.1	Scope
3.2	Austenitic stainless steels
3.3	Duplex stainless steels
3.4	Martensitic stainless steels
Section 4	Welding procedure tests for non-ferrous alloys
4.1	Requirements for aluminium alloys
4.2	Requirements for copper alloys
Section 5	Welder qualification tests
5.1	Scope
5.2	Welder qualification test assemblies
5.3	Examination and testing
5.4	Acceptance criteria
5.5	Failure to meet requirements
5.6	Range of approval
5.7	Welders qualification certification

CHAPTER 13	REQUIREMENTS FOR WELDED CONSTRUCTION
Section 1	General welding requirements
1.1	Scope
1.2	Design
1.3	Materials
1.4	Requirements for manufacture and workmanship
1.5	Cutting of materials
1.6	Forming and bending
1.7	Assembly and preparation for welding
1.8	Welding equipment and welding consumables
1.9	Welding procedure and welder qualifications
1.10	Welding during construction
1.11	Non-destructive examination of welds
1.12	Routine weld tests
1.13	Rectification of material defects
1.14	Rectification of distortion

	1.15	Rectification of welds defects
	1.16	Post-weld heat treatment
	1.17	Certification
Section	2	Specific requirements for ship hull and machinery
	2.1	Scope
	2.2	Welding consumables
	2.3	Welding procedure and welder qualifications
	2.4	Construction and workmanship
	2.5	Butt welds
	2.6	Lap connections
	2.7	Closing plates
	2.8	Stud welding
	2.9	Fillet welds
	2.10	Post-weld heat treatment
	2.11	Tolerances
	2.12	Non-destructive examination of welds
	2.13	Weld repairs
	2.14	Welding afloat with water backing
Section	3	Specific requirements for fabricated steel sections
	3.1	Scope
	3.2	Dimensions and tolerances
	3.3	Identification of products
	3.4	Manufacture and workmanship
	3.5	Non-destructive examination
	3.6	Routine weld tests
	3.7	Certification and records
Section	4	Specific requirements for fusion welded pressure vessels
	4.1	Scope
	4.2	Cutting and forming of shells and heads
	4.3	Fitting of shell plates and attachments
	4.4	Welding
	4.5	General requirements for routine weld production tests
	4.6	Production test plate assembly requirements
	4.7	Inspection and testing
	4.8	Mechanical requirements
	4.9	Failure to meet requirements
	4.10	Heat treatment
	4.11	Basic requirements for heat treatment of fusion welded pressure vessels
	4.12	Non-Destructive Examination of welds
	4.13	Extent of NDE for Class 1 pressure vessels
	4.14	Extent of NDE for Class 2/1 pressure vessels
	4.15	NDE method
	4.16	Evaluation and reports
	4.17	Repair to welds
Section	5	Specific requirements for pressure pipework
	5.1	Scope
	5.2	Manufacture and workmanship
	5.3	Heat treatment after bending of pipes
	5.4	Post-weld heat treatment
	5.5	Non-destructive examination
	5.6	Repairs to pipe welds
Section	6	Repair of existing ships by welding
	6.1	Scope
	6.2	Materials used for repairs
	6.3	Workmanship
	6.4	Non-destructive examination
	6.5	Repairs to welds defects

Section	7	Austenitic and duplex stainless steel – Specific requirements
	7.1	Scope
	7.2	Design
	7.3	Forming and bending
	7.4	Fabrication and welding
	7.5	Repairs
 CHAPTER	 14	 PLASTICS MATERIALS
Section	1	General requirements
	1.1	Scope
	1.2	Information on material quality and application
	1.3	Manufacture
	1.4	Survey procedure
	1.5	Alternative survey procedure
	1.6	Post-cure heating
	1.7	Test material
	1.8	Re-test procedure
	1.9	Visual and non-destructive examination
	1.10	Rectification of defective material
	1.11	Identification of products and base materials
	1.12	Certification
 Section	 2	 Tests on polymers, resins, reinforcements and associated materials
	2.1	Scope
	2.2	Thermoplastic polymers
	2.3	Thermosetting resins
	2.4	Reinforcements
	2.5	Reinforced thermoplastic polymers
	2.6	Reinforced thermosetting resins
	2.7	Core materials
	2.8	Specific requirements for end-grain balsa
	2.9	Specific requirements for rigid foams (PVC, Polyurethane and other types)
	2.10	Synthetic felt type materials with or without microspheres
	2.11	Machinery chocking compounds (resin chocks)
	2.12	Rudder and pintle bearings
	2.13	Stern tube bearings
	2.14	Plywoods
	2.15	Adhesive and sealant materials
	2.16	Repair compounds
 Section	 3	 Testing procedures
	3.1	General
	3.2	Preparation of test samples
	3.3	Preparation of test specimens
	3.4	Testing
	3.5	Discarding of test specimens
	3.6	Reporting of results
	3.7	Tests for specific materials
	3.8	Structural core materials
	3.9	Machinery chocking compounds
	3.10	Rudder and pintle bearings
	3.11	Stern tube bearings

Section	4	Plastics pipes and fittings
	4.1	Scope
	4.2	Design requirements
	4.3	Manufacture
	4.4	Quality assurance
	4.5	Dimensional tolerances
	4.6	Composition
	4.7	Testing
	4.8	Visual examination
	4.9	Hydraulic test
	4.10	Repair procedure
	4.11	Identification
	4.12	Certification
Section	5	Control of material quality for composite construction
	5.1	Scope
	5.2	Design submission
	5.3	Construction
	5.4	Quality assurance
	5.5	Dimensional tolerances
	5.6	Material composition
	5.7	Material testing
	5.8	Visual examination
	5.9	Repair procedure
	5.10	Material identification
	5.11	Minimum tested requirements for material approval
	5.12	Closed cell foams for core construction based on PVC or polyurethane
	5.13	End-grain balsa
	5.14	Other materials

General Requirements

Chapter 1

Sections 1 & 2

Section

- 1 **Scope**
- 2 **Approval and survey requirements**
- 3 **Certification of materials**
- 4 **General requirements for manufacture**

■ Section 1 Scope

1.1 General

1.1.1 Materials used for the construction, conversion, modification or repair of ships, other marine structures and associated machinery which are classed or are intended for classification by Lloyd's Register (hereinafter referred to as LR), are to be manufactured, tested and inspected in accordance with these Rules.

1.1.2 Wrought, cast and extruded materials are to comply with the requirements of Chapters 1 and 2, and the appropriate specific requirements of Chapters 3 to 9 of these Rules. Mooring and anchoring equipment is to comply with the requirements of Chapters 1 and 2, and the appropriate specific requirements of Chapter 10. Manufacturers of these materials must be approved by LR according to the requirements in Sections 2 or 3. Only those materials within a manufacturer's scope of approval may be used.

1.1.3 Welding consumables are to comply with the requirements of Chapter 11 of these Rules.

1.1.4 Where welding is used for the construction, conversion, modification or repair of ships, other marine structures and associated machinery which are classed or are intended for classification by LR, welding qualifications and tests shall be performed according to Chapter 12 of these Rules. All welding shall be performed according to Chapter 13 of these Rules.

1.1.5 Plastics materials are to comply with the requirements of Chapter 14 of these Rules.

1.1.6 The materials and components which are to comply with these requirements for the purposes of classification are defined in the relevant Rules dealing with design and construction.

■ Section 2 Approval and survey requirements

2.1 Approval and survey requirements – General

2.1.1 Marine materials manufactured in accordance with Chapters 3 to 10 of these Rules are to be made at works which have been approved by LR for the type and grade of product being supplied.

2.1.2 Materials manufactured in accordance with Chapters 3 to 10 of these Rules are to be manufactured, tested and inspected under Survey according to the requirements of one of the following two schemes:

- (a) The Materials Survey Scheme, see 2.3.
- (b) The Materials Quality Scheme, see 2.4.

2.1.3 For the purposes of survey, LR Surveyors are to be allowed access to all relevant parts of the works, and are to be provided with the necessary facilities and information to enable them to verify that the manufacture is being carried out in accordance with the approved procedures. Facilities are also to be provided for the selection of test material, the witnessing of mechanical tests and the examination of materials, as required by these Rules.

2.1.4 Where a production process, testing or examination of materials is sub-contracted, this must be with the approval of LR. Surveyors are to be allowed access to the sub-contractor's premises in order to conduct Surveys according to the requirements of these Rules.

2.1.5 Products manufactured in accordance with Chapters 11 and 14 are to be approved in accordance with the requirements therein. For these materials, approval is given for a specific product on a type approval basis, rather than the approved manufacturer/survey arrangements applied to materials covered by Chapters 3 to 10.

2.2 LR Approval – General

2.2.1 Unless specifically stated in other Chapters of these Rules, all LR approvals apply to materials used in applications intended for marine service, as described in 1.1.

2.2.2 The procedures for application for approval of manufacturers and products, the details of the information to be supplied by the manufacturer, and the test programme to be conducted on the products are given in the appropriate book of LR's *Materials and Qualification Procedures for Ships* (MQPS). This is published in the CD Live section of LR's web site at <http://www.lr.org>.

General Requirements

Chapter 1

Section 2

2.2.3 LR publishes lists of approved manufacturers and approved products. The lists are published in the CD Live section of LR's website, <http://www.lr.org>. They are also available on the CD-ROM version of the *Rules and Regulations for the Classification of Ships* available from LR. The lists are as follows:

- *List of Approved Manufacturers of Materials.*
- *Approved Welding Consumables for Use in Ship Construction.*
- *Lists of Paints, Resins, Reinforcements and Associated Materials.*
- *Lists of Approved Anchors.*

2.2.4 For initial LR approval as an Approved Manufacturer for a particular material, the manufacturer is required to demonstrate to the satisfaction of LR that the necessary manufacturing and testing facilities are available, and are supervised by suitably qualified personnel. A specified programme of tests is to be carried out under the supervision of LR Surveyors, and the results are to be to the satisfaction of LR.

2.2.5 If the results of the initial assessment of the manufacturer, and the test programme are considered satisfactory, the manufacturer will be added to the list of approved manufacturers of materials, and a certificate of approval will be issued to the manufacturer by LR, showing the scope of materials and grades covered by the approval. Initial approval will generally be under the Materials Survey Scheme, see 2.3.

2.2.6 Approved manufacturers who meet the entry requirements may apply for approval under the Materials Quality Scheme, see 2.4.

2.2.7 When a manufacturer has more than one works, the manufacturer's approval shall only be valid for the works where the test programme was conducted.

2.2.8 It is the manufacturer's responsibility to advise LR of all changes to the manufacturing process parameters that may affect the application of the material, prior to the adoption of the changes in production. Additional approval tests may be required to maintain the approval.

2.2.9 Maintenance of approval is dependent on the manufacturer continuing to meet the requirements of the applicable sections of these Rules.

2.2.10 Where it is considered that an approved manufacturer is not maintaining its responsibilities to comply with these Rules, the approval may be suspended by LR until such time that agreed corrective and preventive actions are considered to have been satisfactorily carried out. If considered necessary, LR may require that the normal level of testing and inspection is increased.

2.2.11 In all instances, LR will reduce the scope of, or withdraw approval from, a manufacturer where it becomes apparent that the manufacturer is unable to maintain compliance with these Rules or the scope of approval.

2.2.12 Where a manufacturer disagrees with any decisions made with regard to LR approval, they may appeal in writing to LR.

2.2.13 Any documents, data or other information received as part of the approval process will be treated as strictly confidential, and will not be disclosed to any third party, without the manufacturer's prior written consent.

2.3 Materials Survey Scheme

2.3.1 Materials according to Chapters 3 to 10 of these Rules and produced under the Materials Survey Scheme will be subject to Direct Survey by an LR Surveyor. The scheme requires the Surveyor to survey and certify all materials according to the requirements of these Rules.

2.3.2 Approved manufacturers are to request a survey of the material by an LR Surveyor, when required. Manufacturers must provide the Surveyor with details of the order, specification and any special conditions additional to the requirements of these Rules.

2.3.3 All mechanical tests required by these Rules are to be witnessed. The Surveyor may allow part of this task to be carried out by a member of the works staff by prior written agreement.

2.3.4 Before final acceptance, all materials are to be submitted to the specified tests and examinations under conditions acceptable to the Surveyor. The results are to comply with the Rules, and all materials are to be to the satisfaction of the Surveyor.

2.3.5 The specified tests and examinations are to be carried out prior to the despatch of finished materials from the manufacturer's works. Where materials are supplied in the rough or unfinished condition, as many as possible of the specified tests are to be carried out by the manufacturer, and any tests or examinations that are not completed are to be carried out under survey at a subsequent stage of manufacture.

2.3.6 In the event of any material proving unsatisfactory during subsequent working, machining or fabrication, such material is to be rejected, notwithstanding any previous certification.

2.3.7 In addition to witnessing test results, the Surveyor is responsible for ensuring that the manufacturing process, inspection, testing, identification and certification are properly conducted. As part of the Materials Survey Scheme, regular visits will be made to all relevant parts of the works to check for compliance against the requirements of these Rules, and to ensure that the manufacturer is maintaining the capability to consistently produce approved materials.

2.3.8 The Surveyor, when satisfied that the material fully meets the requirements of these Rules, will certify the material in accordance with Section 3 and the appropriate Chapter of these Rules.

General Requirements

Chapter 1

Section 2

2.3.9 For a manufacturer to maintain approval under this scheme, the works will be subject to a periodic inspection of all relevant parts of the works, at intervals not exceeding three years. The procedure for this periodic inspection is given in Book B of LR's *Materials and Qualification Procedures for Ships* (MQPS). This periodic inspection is in addition to the regular visits made according to 2.3.7.

2.4 Materials Quality Scheme

2.4.1 The manufacturer may apply to be approved under the Materials Quality Scheme where the following requirements are met:

- (a) The manufacturer has been approved by LR for a minimum of three years; and
- (b) The manufacturer has a quality management system, which has been certified as meeting the requirements of ISO 9001 by a certification body recognised by LR, which is one accredited by a member of the International Accreditation Forum; and
- (c) The manufacturer has a satisfactory history of quality performance in the manufacture and supply of LR approved materials.

2.4.2 Special consideration may be given to manufacturers who have not been approved under the Materials Survey Scheme, and may be considered onto the Materials Quality Scheme providing:

- (a) They have a quality management system which has been certified as meeting the requirements of ISO 9001 by a certification body recognised by LR, which is one accredited by a member of the International Accreditation Forum.
- (b) They can demonstrate a history of satisfactory supply of materials which LR deems to be equivalent to those for which approval under the Materials Quality Scheme is requested.

In this case, the initial assessment of the manufacturer will include the product testing regime, as required for initial approval under the Materials Survey Scheme, see 2.2.4.

2.4.3 The Scheme is based on a Scheme Certification Schedule, made between LR and each individual manufacturer. The schedule will stipulate:

- (a) The scope of approved products covered by the approval.
- (b) The process route applied by the manufacturer for each approved product.
- (c) The arrangements for LR scheme, audits, including scope, frequency, schedule, etc.
- (d) Agreed procedures for certification of approved materials.
- (e) Information to be supplied periodically to LR by the manufacturer.
- (f) Procedures for the use of the scheme mark.

2.4.4 The contents of the Scheme Certification Schedule are to remain confidential between LR and the manufacturer.

2.4.5 The Materials Quality Scheme is based on a technical audit approach, and is designed to complement the quality management systems audits performed to ISO 9001. The role of the Surveyor in scheme audits is to:

- (a) Verify that the quality management system is being maintained and audited to the requirements of ISO 9001.
- (b) Verify that the requirements of these Rules are being implemented.
- (c) Verify that the requirements of this Scheme are being implemented.
- (d) Perform Scheme audits, which focus on the technical aspects of the product realisation process, particularly with regard to Rule requirements.
- (e) Perform witness testing as required.
- (f) Verify the data supplied to LR periodically by the manufacturer as part of the Scheme requirements.

2.4.6 The Materials Quality Scheme may be applied to any approved manufacturer who meets the eligibility requirements, and who applies to be approved under the scheme. If approved under the scheme, the manufacturer's name will appear on the List of Approved Manufacturers published by LR, with an indication that they are approved under this scheme.

2.4.7 The scheme is available to manufacturers producing approved materials according to Chapters 3 to 10 of these Rules.

2.4.8 The procedures for application for approval for the Materials Quality Scheme are given in Book M of LR's *Materials and Qualification Procedures for Ships* (MQPS).

2.4.9 Where LR is satisfied that the manufacturer meets all of the requirements of the Scheme, and that it is appropriate for the products being manufactured, a Scheme Certification Schedule will be issued, which must be signed by an authorised representative of the manufacturer.

2.4.10 Once the Scheme Certification Schedule has been signed by both parties, LR will issue the manufacturer with a certificate of approval according to the Materials Quality Scheme.

2.4.11 Maintenance of approval will be according to the Scheme Certification Schedule agreed between LR and the manufacturer, and these Rules.

2.4.12 It is the responsibility of the attending Surveyor to perform regular Scheme audits at the manufacturer's works in accordance with the Scheme Certification Schedule, and the requirements of these Rules.

2.4.13 It is not the intention to repeat the audit according to ISO 9001 conducted by the recognised certification body. The Surveyor is, however, to be satisfied that these audits are being conducted effectively. Where appropriate, the Surveyor may conduct a partial audit to ISO 9001 to verify this.

General Requirements

Chapter 1

Sections 2 & 3

2.4.14 Witness tests may be conducted as part of the Scheme audit. This will involve the selection of material, and the witness of sampling and testing according to the requirements of the appropriate chapter of these Rules. Such witness testing may be on LR grades, or materials which the Surveyor deems to be equivalent (for the purposes of audit testing only).

2.4.15 Once every three years, a full assessment of scheme compliance will be conducted by a Surveyor who is not the regular attending Surveyor.

2.4.16 In the event of any change which means that the manufacturer no longer meets the requirements for the Materials Quality Scheme (for example the loss of ISO 9001 approval), the Scheme certificate of approval will be revoked. The manufacturer will revert to the Materials Survey Scheme, and will be subject to survey according to that scheme.

Section 3 Certification of materials

3.1 General

3.1.1 All materials subject to these Rules are to be supplied with appropriate certification, as required by the relevant requirements of these Rules. This will normally be an LR certificate or a manufacturer's certificate validated by LR, although a manufacturer's certificate may be accepted where allowed by the relevant requirements of these Rules.

3.1.2 Manufacturers approved under the Materials Quality Scheme are licensed to apply the scheme mark to manufacturer's certificates according to the requirements of the scheme, see 2.4.

3.1.3 The following certificate types are to be used, (a) and (b) for the Materials Survey Scheme, and (d) for the Materials Quality Scheme:

(a) **LR Certificate**

This type of certificate is issued by LR based on the results of testing and inspection being satisfactorily carried out in accordance with the requirements of these Rules.

(b) **Manufacturer's certificate validated by LR**

A manufacturer's certificate, validated by LR on the basis of inspection and testing carried out on the delivered product in accordance with the requirements of these Rules may be accepted. In this case, the certificate will include the following statement:

"We hereby certify that the material has been made by an approved process and satisfactorily tested in accordance with the Rules of Lloyd's Register."

(c) **Manufacturer's certificate**

This type of certificate is issued by the manufacturer based on the results of testing and inspection being satisfactorily carried out in accordance with the requirements of these Rules or the applicable National or International standard. The certificate is to be validated by the manufacturer's authorised representative, independent of the manufacturing department. The certificate will contain a declaration that the products are in compliance with the requirements of these Rules or the applicable National or International standard.

(d) **Manufacturer's certificate issued under the Materials Quality Scheme**

Where a manufacturer is approved according to the Materials Quality Scheme, they will issue manufacturer's certificates bearing the scheme mark. The certificates must also bear the following statement:

"This certificate is issued under the arrangements authorised by Lloyd's Register (operating group) in accordance with the requirements of the Materials Quality Scheme and certificate number MQS"

3.1.4 Where these Rules allow for the issue of a manufacturer's certificate for materials, either validated by an LR Surveyor, or bearing the Materials Quality Scheme mark, the manufacturer is to ensure that a copy of the certificate is supplied to LR.

3.2 Materials Survey Scheme

3.2.1 The requirements for certification of materials according to the Materials Survey Scheme are established by the relevant requirements of these Rules.

3.2.2 The manufacturer is to supply the surveyor with any additional customer order requirements that are in addition to the requirements of these Rules, when the request for the issue or validation of the certificate is made.

3.3 Materials Quality Scheme

3.3.1 Part of the certification schedule will include an agreement for the manufacturer to apply the scheme mark to manufacturer's certificates relating to approved products within the scope of approval of the manufacturer.

3.3.2 The use of the scheme mark is governed by the following:

- (a) The use of the scheme mark is not transferable. It is only to be used in conjunction with the manufacturer and works name and location shown on the certificate of approval.
- (b) The scheme mark must be applied to all manufacturers' certificates relating to approved materials produced under the Scheme.
- (c) In no circumstances is the scheme mark to be applied to test certificates relating to non-approved products.
- (d) The scheme mark is not to be used in any way which may imply approval for products which are not covered within the manufacturer's scope of approval.

- (e) Where a manufacturer is removed or suspended from the scheme, use of the scheme mark must cease immediately.

3.3.3 The certificate as given in 3.1.3(d) is to be validated by an authorised representative of the manufacturer. The size and position of the scheme mark and statement on the manufacturer's certificate must be agreed by LR.

3.3.4 Where manufacturers are approved under this scheme, the manufacturer's certificate issued according to these requirements fully meets the materials certification requirements of these Rules.

3.4 Electronic certification

3.4.1 Where these Rules allow the issue of manufacturers' test certificates, under either the Materials Survey Scheme or the Materials Quality Scheme, these may be issued in electronic format provided that:

- All tests and inspections have been satisfactorily completed according to the requirements of these Rules.
- Procedures are in place to ensure that electronic certificates are only issued according to the requirements of these Rules.
- The certification system is subject to regular inspection by the attending Surveyor.
- A copy of the electronic certificate is supplied to LR. This copy will be deemed to be the original of the test certificate.

3.4.2 In addition to the requirements of 3.4.1, for items certified under the Materials Survey Scheme, the LR office stamp and Surveyor's name may be applied electronically. This is only allowed where the Surveyor has access to the results of the relevant tests and inspections, and is able to authorise by access to the electronic system, the application of the LR office stamp and Surveyor's name on the test certificate. The name of the authorising Surveyor is to be the name included on the certificate. The authorisation may be conducted electronically either at the manufacturers' works, or remotely by the Surveyor.

3.4.3 If the LR office stamp and name are being applied electronically according to 3.4.2, then the manufacturer is to ensure that the Surveyor is provided with all relevant information regarding the customer order, when the request for authorisation is made.

Section 4 General requirements for manufacture

4.1 General

4.1.1 The following definitions are applicable to these Rules:

Item: A single forging, casting, plate, tube or other rolled product as delivered.

Piece: The rolled product from a single slab or billet or from a single ingot if this is rolled directly into plates, strip, sections or bars.

Batch: A number of similar items or pieces presented as a group for acceptance testing.

4.1.2 Where a manufacturer purchases semi-finished products (e.g. slabs) for the purpose of re-processing (e.g. rolling), the manufacturer is to ensure that the materials are from an LR approved manufacturer, and manufactured within the scope of approval of that manufacturer. The aim of chemical analysis, dimensions, surface and internal quality checks are to be agreed between the manufacturer and purchaser. The semi-finished materials must be supplied with appropriate certification, according to these Rules.

4.1.3 It is the responsibility of the manufacturer to ensure compliance with all relevant aspects of these Rules. All deviations are to be recorded as non-compliances, and brought to the attention of the Surveyor, along with corrective actions taken. Failure to do this is considered to render the material as not complying with these Rules.

4.1.4 The manufacturer is to maintain all test and inspection records required by these Rules for at least seven years. Records are to be made available to LR on request.

4.1.5 Where material is produced which does not meet all aspects of these Rules, the manufacturer may apply to LR for a concession to certify the material as approved. LR will consider each application on a case-by-case basis, although concession will only normally be granted in exceptional circumstances. If the concession is granted, a formal written numbered concession will be issued to the manufacturer. The concession number must be applied to the approval certificate, whether it is an LR certificate or a validated manufacturer's certificate.

4.2 Chemical composition

4.2.1 The ladle analysis used for certification purposes is to be determined after all alloying elements have been added and sufficient time allowed for such additions to equalise throughout the ladle.

4.2.2 The method of taking samples is to ensure that the reported analysis is representative of the cast. In addition, the manufacturer must determine and certify the chemical composition of every heat of material.

General Requirements

Chapter 1

Section 4

4.2.3 Where more than one sample is taken, the method of averaging for the final certificate result and the determination of acceptable variations in composition are to be agreed with the Surveyor.

4.2.4 The chemical composition of ladle samples is to be determined by the manufacturer in an adequately equipped and competently staffed laboratory. The manufacturer's analysis will be accepted, but may be subject to occasional independent checks if required by the Surveyor.

4.2.5 The analysis is to include the content of all the elements detailed in the relevant Sections of the Rules and, where appropriate, the National or International Standard applied.

4.2.6 At the discretion of the Surveyors, a check chemical analysis of suitable samples from products may also be required. These samples are to be taken from the material used for mechanical tests but, where this is not practicable, an alternative procedure for obtaining a representative sample is to be agreed with the manufacturer. For product samples, the permissible limits of deviation from the specified ladle analysis are to be in accordance with an appropriate International or National Standard specification.

4.3 Heat treatment

4.3.1 Materials are to be supplied in the condition specified in, or permitted by, the relevant Chapters of these Rules.

4.3.2 Heat treatment is to be carried out in properly constructed furnaces which are efficiently maintained and have adequate means for control and recording of temperature. The furnace dimensions are to be such as to allow the whole item to be uniformly heated to the necessary temperature. In the case of very large components which require heat treatment, alternative methods will be specially considered.

4.3.3 The manufacturer is to maintain the records, including the temperature charts of all heat treatments for at least seven years.

4.4 Test material

4.4.1 Sufficient test material is to be provided for the preparation of the test specimen detailed in the specific requirements. It is, however, in the interests of manufacturers to provide additional material for any re-tests which may be necessary, as insufficient or unacceptable test material may be a cause for rejection.

4.4.2 The test material is to be representative of the item or batch and is not to be separated until all the specified heat treatment has been completed, except where provision for an alternative procedure is made in subsequent Chapters of these Rules.

4.4.3 All test material is to be selected by the Surveyor or an authorised deputy and identified by suitable markings which are to be maintained during the preparation of the test specimens.

4.5 Mechanical tests

4.5.1 The dimensions, number and direction of test specimens are to be in accordance with the requirements of Chapter 2 and the specific requirements for the product.

4.5.2 Where Charpy impact tests are required, a set of three test specimens is to be prepared and the average energy value is to comply with the requirements of subsequent Chapters. One individual value may be less than the required average value provided that it is not less than 70 per cent of that value.

4.5.3 In the Rules, mechanical properties are specified in SI units, but alternative units may be used for acceptance testing. In such cases, the specified values are to be converted in accordance with the appropriate conversions given in Table 1.4.1. It is preferred that test results be reported in SI units, but alternative units may be used provided that the test certificate gives, in the same units, the equivalent specification values.

Table 1.4.1 Conversions from SI units to metric and Imperial units

1 N/mm ² or MPa	=	0,102 kgf/mm ²
1 N/mm ² or MPa	=	0,0647 tonf/in ²
1 N/mm ² or MPa	=	0,145 x 10 ³ lbf/in ²
1J	=	0,102 kgf m
1J	=	0,738 ft lbs
1 kgf/mm ²	=	9,81 N/mm ² or MPa
1 tonf/in ²	=	15,4 N/mm ² or MPa
1 lbf/in ²	=	6,89 x 10 ⁻³ N/mm ² or MPa
1 kgf m	=	9,81 J
1 ft lbf	=	1,36 J

4.6 Re-test procedures

4.6.1 Re-test procedures are to be in accordance with the requirements of Ch 2,1.4.

4.7 Visual and non-destructive examination

4.7.1 Prior to the final acceptance of materials, surface inspection, verification of dimensions and non-destructive examination are to be carried out in accordance with the requirements detailed in subsequent Chapters of these Rules.

4.7.2 The responsibility for maintaining the required tolerances and making the necessary measurements rests with the manufacturer. Occasional checking by the Surveyor does not absolve the manufacturer from this responsibility.

General Requirements

Chapter 1

Section 4

4.7.3 When there is visible evidence to doubt the soundness of any material or component, such as flaws in test specimens or suspicious surface marks, the manufacturer is expected to prove the quality of the material by any suitable method.

4.9.4 Where a number of identical items are securely fastened together in bundles, the manufacturer need only brand the top item of each bundle. Alternatively, a durable label giving the required particulars may be attached to each bundle.

4.8 Rectification of defective material

4.8.1 Small surface imperfections may be removed by mechanical means provided that, after such treatment, the dimensions are acceptable, the area is proved free from defects and the rectification has been completed in accordance with any applicable requirements of subsequent Chapters of these Rules and to the satisfaction of the Surveyor.

4.8.2 The repair of defects by welding can be accepted only when permitted by the appropriate specific requirements and provided that the agreement of the Surveyor is obtained before the work is commenced. When a repair has been agreed, it is necessary in all cases to prove by suitable methods of non-destructive examination that the defects have been completely removed before welding is commenced. Welding procedures and inspection on completion of the repair are to be in accordance with the appropriate specific requirements and are to be to the satisfaction of the Surveyor.

4.8.3 Manufacturers wishing to carry out welding work must have at their disposal the necessary workshops, lifting gear, welding equipment, pre-heating, and where necessary annealing facilities and testing devices, as well as certified welders and supervisors to enable them to perform the work properly. Proof shall be furnished to the Surveyor that these conditions are satisfied before welding work begins.

4.9 Identification of materials

4.9.1 The manufacturer is to adopt a system of identification which will enable all finished materials to be traced to the original cast, and the Surveyors are to be given full facilities for tracing the material when required. When any item has been identified by the personal mark of a Surveyor, or his deputy, this is not to be removed until an acceptable new identification mark has been made by a Surveyor. Failure to comply with this condition will render the item liable to rejection.

4.9.2 Before any item is finally accepted it is to be clearly marked by the manufacturer in at least one place with the particulars detailed in the appropriate specific requirements.

4.9.3 Hard stamping is to be used except where this may be detrimental to the material, in which case stencilling, painting or electric etching is to be used. Paints used to identify alloy steels are to be free from lead, copper, zinc or tin, i.e. the dried film is not to contain any of these elements in quantities of more than 250 ppm.

Testing Procedures for Metallic Materials

Chapter 2

Section 1

Section

- 1 **General requirements for testing**
- 2 **Tensile tests**
- 3 **Impact tests**
- 4 **Ductility tests for pipes and tubes**
- 5 **Embrittlement tests**
- 6 **Crack tip opening displacement tests**
- 7 **Bend tests**
- 8 **Corrosion tests**

■ Section 1 General requirements for testing

1.1 Preparation of test specimens

1.1.1 The requirements specified below detail all the tests that may be applied to metallic materials. The specific tests and the test specimen types required for each material type, grade and product type are detailed in the subsequent Chapter of these Rules.

1.1.2 Where test material is cut from products by shearing or flame cutting, a reasonable margin is required to allow sufficient material to be removed from the cut edges during machining of the test specimens.

1.1.3 Test specimens are to be prepared in such a manner that they are not subjected to any significant work hardening, cold straining or heating during straightening or machining.

1.1.4 Test samples are not to be removed from the material they represent until heat treatment is complete. For castings in cases where test samples are separately cast, the castings and samples are to be heat treated together.

1.1.5 Dimensional tolerances are to comply with a relevant ISO specification.

1.2 Testing machines

1.2.1 All tests are to be carried out by competent personnel. Testing machines are to be maintained in a satisfactory and accurate condition and are to be recalibrated at approximately annual intervals. This calibration is to be carried out by organisations of standing that have been approved or recognised by a National Authority and are to be to the satisfaction of the Surveyor. A record of all calibrations is to be kept available in the test house.

1.2.2 Tensile testing machine load cells are to be calibrated with an accuracy of \pm one per cent in accordance with ISO 7500-1 or another recognised National Standard.

1.2.3 Impact tests are to be carried out on Charpy V-notch machines calibrated to ISO 148, EN 10045 or ASTM E23 dependent on the testing machine type. The testing machines are to be calibrated using either a direct or indirect method. Other National Standards equivalent to ISO 148 may be considered.

1.3 Discarding of test specimens

1.3.1 If a test specimen fails because of faulty preparation or incorrect operation of the testing machine it may be discarded and replaced by a new test specimen prepared from material adjacent to the original test.

1.3.2 In addition to the discarding of test specimens as indicated in 1.3.1, a tensile test specimen may also be discarded when the specified minimum elongation is not obtained and the distance between the fracture and the nearest gauge mark is less than one-quarter of the gauge length.

1.4 Re-testing procedures

1.4.1 Where the result of any test, other than an impact test, does not comply with the requirements, two additional tests of the same type are to be made from the same test sample, or if sufficient material is not available, a further representative sample taken from the item under test. For acceptance of the material, satisfactory results are to be obtained from both of these additional tests.

1.4.2 Where the result of any test taken from a weld procedure approval test, other than an impact test, does not comply with the requirements, two additional tests of the same type are to be made from the same weld test assembly. Where insufficient original welded assembly is available, a new assembly is to be prepared using the same conditions as the original test weld. For acceptance, satisfactory results are to be obtained from both of these additional tests.

1.4.3 Where the result of any test taken from a welding consumable approval test, other than an impact test, does not comply with the requirements, two additional tests of the same type are to be made from the same weld test assembly. Where insufficient original welded assembly is available, a new assembly is to be prepared using welding consumables from the same batch. If the new assembly is made with the same procedure (particularly the same number of runs) as the original assembly, only the duplicate re-test specimens need be prepared and tested. For acceptance of a weld consumable batch, satisfactory results are to be obtained from both of these additional tests.

Testing Procedures for Metallic Materials

Chapter 2

Sections 1 & 2

1.4.4 Where the results from a set of three impact test specimens do not comply with the requirements, an additional set of three impact test specimens may be tested provided that, of the original set tested, not more than two individual values are less than the required average value and, of these, not more than one is less than 70 per cent of this average value. The results obtained are to be combined with the original results to form a new average which, for acceptance, is to be not less than the required average value. Additionally, for these combined results, not more than two individual values are to be less than the required average value and, of these, not more than one is to be less than 70 per cent of this average value.

1.4.5 The additional tests detailed in 1.4.1 and 1.4.2 are, where possible, to be made on material adjacent to the original samples. For castings, where insufficient material remains in the original test samples, the additional test may be made on other test samples representative of the castings. See also 1.3 for discarding of test specimens.

1.4.6 When unsatisfactory results are obtained from tests representative of a batch of material, the item or piece from which the tests were taken is to be rejected. The remainder of the material in the batch may be accepted provided that two further items or pieces are selected and tested with satisfactory results. If the tests from one or both of these additional items or pieces give unsatisfactory results, the batch is to be rejected.

1.4.7 When a batch of material is rejected, the remaining items or pieces in the batch may be resubmitted individually for test, and those which give satisfactory results may be accepted.

1.4.8 At the option of the manufacturer, rejected material may be resubmitted as another grade and may then be accepted, provided that the test results comply with the appropriate requirements.

1.4.9 When material which is intended to be supplied in the 'as-rolled' or 'hot-finished' condition fails test, it may be suitably heat treated and resubmitted for test. Similarly, materials supplied in the heat treated condition may be reheated and resubmitted for test. Unless otherwise agreed by the Surveyor, such reheat treatment is to be limited to one repeat of the final heat treatment cycle.

2.1.2 The gauge length is to be greater than 20 mm and may be rounded off to the nearest 5 mm provided that the difference between the adjusted gauge length and the calculated one is less than 10 per cent of the calculated gauge length.

2.1.3 For forgings and castings (excluding those in grey cast iron) proportional test specimens of circular cross-section are to be machined to the dimensions shown in Fig. 2.2.1.

2.1.4 For hot rolled bars and similar products, the test specimens are to be as in Fig. 2.2.1, except that for small sizes they may consist of a suitable length of bar or other product tested in the full cross-section.

2.1.5 As an alternative to 2.1.3 and 2.1.4, proportional or non-proportional test specimens of other dimensions may be used, subject to any requirements for minimum cross-sectional area given in subsequent Chapters of these Rules. Where the size of proportional test specimens is other than as shown in Fig. 2.2.1, the general dimensions are to conform with Fig. 2.2.2.

Section 2 Tensile tests

2.1 Dimensions of test specimens

2.1.1 Proportional test specimens with a gauge length L_0 of $5.65 \sqrt{S_0}$ or $5d$, where S_0 is the cross-sectional area, d the diameter and L_0 the parallel test length, have been adopted as the standard form of test specimen, and in subsequent Chapters in these Rules the minimum percentage elongation values are given for test specimens of these proportions.

Testing Procedures for Metallic Materials

Chapter 2

Section 2

2.1.6 For plates, strip and sections, the test specimens are to be machined to the dimensions shown in Fig. 2.2.3 or Fig. 2.2.4. Where the capacity of the available testing machine is insufficient to allow the use of a test specimen of full thickness, this may be reduced by machining one of the rolled surfaces. Alternatively, for materials over 40 mm thick, test specimens of circular cross-section machined to the dimensions shown in Fig. 2.2.1 may be used. The axes of these test specimens are to be located at approximately one quarter of the thickness from one of the rolled surfaces.

cross-sectional area of this type of test specimen is to be calculated from:

$$S_0 = ab$$

where

S_0 = cross-sectional area

a = average radial thickness

b = average width

Test specimens of circular cross-section may also be used provided that the wall thickness is sufficient to allow the machining of such specimens to the dimensions shown in Fig. 2.2.1, with their axes located at the mid-wall thickness.

2.1.7 As an alternative to 2.1.6, test specimens with a width of other than 25 mm may be used subject to any requirements for minimum cross-sectional area given in subsequent Chapters of these Rules. A ratio of width/thickness of 8:1 should not be exceeded.

2.1.8 For pipes and tubes, the test specimens may consist of a suitable length tested in full cross-section with the ends plugged. The gauge length is to be $5,65 \sqrt{S_0}$ or 50 mm, and the length of the test specimen between the grips or plugs, whichever is the smaller, is to be not less than the gauge length plus D , where D is the external diameter. Alternatively, test specimens may be prepared from strips cut longitudinally and machined to the dimensions shown in Fig. 2.2.5 or Fig. 2.2.6. The parallel test length is not to be flattened, but the enlarged ends may be flattened for gripping in the testing machine. The

2.1.9 For wire, the test specimen may consist of a suitable length tested in full cross-section. The gauge length is to be 200 mm and the parallel test length 250 mm.

2.1.10 For grey iron castings, the test specimens are to be machined to the dimensions shown in Fig. 2.2.7 or Fig. 2.2.8.

2.1.11 For aluminium alloy plates and sections of thickness, a , less than or equal to 12,5 mm; the dimensions of rectangular cross sectioned test specimens are to be as shown in Fig. 2.2.3. The rectangular cross sectioned test specimen surfaces should remain as rolled/extruded. Where the thickness, a , is greater than 12,5 mm the test specimens are to be of round type as shown in Fig. 2.2.2.

Testing Procedures for Metallic Materials

Chapter 2

Section 2

2.1.14 Through-thickness tensile test specimens may be, at the option of the steelmaker, either plain test specimens or test specimens with welded extensions in accordance with a Recognised Standard. The extension pieces are to be of steel with a tensile strength exceeding that of the plate to be tested and may be attached to the plate surfaces by manual, resistance or friction welding carried out in such a way as to ensure a minimal heat affected zone.

2.1.15 Tolerances on tensile specimen dimensions are to be in accordance with ISO 6892-98 or another Recognised Standard as appropriate.

2.2 Definition of yield stress for steel

2.2.1 The yield phenomenon is not exhibited by all the steels detailed in these Rules but, except for austenitic and duplex stainless steels, the term 'yield stress' is used throughout when requirements are specified for acceptance testing at ambient temperature. For the purposes of the Rules, the terms 'yield stress' and 'yield strength' are to be regarded as synonymous.

2.2.2 Where reference is made to 'yield stress' in the requirements for carbon, carbon-manganese and alloy steel products and in the requirements for the approval of welding consumables, either the upper yield stress or, where this is not clearly exhibited, the 0,2 per cent proof stress or the 0,5 per cent proof stress under load is to be determined. In cases of dispute, the 0,2 per cent proof stress is to be determined.

2.2.3 For austenitic and duplex stainless steel products and welding consumables, both the 0,2 and the 1,0 per cent proof stresses are to be determined.

2.3 Procedure for testing at ambient temperature

2.3.1 Except as provided in 2.3.5, the elastic stress rate for the determination of the upper yield for steels and copper alloys is to be between 6 and 60 N/mm² per second and between 2 and 20 N/mm² per second for aluminium. After reaching the yield or proof load, the straining rate may be increased to a maximum of 0,008s⁻¹ for the determination of the tensile strength.

2.1.12 Deposited weld metal tensile test specimens are to be machined to the dimensions shown in Fig. 2.2.9, and may be heated to a temperature not exceeding 250°C for a period not exceeding 16 hours for hydrogen removal, prior to testing.

2.1.13 Butt weld tensile test specimens are to be machined to the dimensions shown in Fig. 2.2.10. For thicknesses of more than 2 mm, the test width is to be 25 mm. For thicknesses less than 2 mm, the test width is to be reduced to 12 mm. The upper and lower surfaces of the weld are to be filed, ground or machined flush with the surface of the plate.

Testing Procedures for Metallic Materials

Chapter 2

Section 2

2.3.2 For steel, the upper yield stress is to be calculated from:

- the value of stress measured at the commencement of plastic deformation, or
- on a load/extension diagram using the value of stress measured at the first peak obtained during yielding even when the peak is equal to or less than any subsequent peaks observed during plastic deformation at yield.

2.3.3 When a well defined yield point cannot be obtained, the 0,2 or 1,0 per cent proof stress (non-proportional elongation) is to be determined from an accurate load/extension diagram by drawing a line parallel to the straight elastic portion and a distance from it where the amount represents 0,2 or 1,0 per cent of the extensometer gauge length. The point of intersection of this line with the plastic portion of the diagram represents the proof load, from which the 0,2 or 1,0 per cent proof stress can be calculated.

2.3.4 For stainless steels the 1,0 per cent proof stress and/or 0,2 per cent proof stress is specified as required by the relevant Chapters in these Rules.

2.3.5 For the determination of the tensile strength of flake graphite cast iron, the stress rate is not to exceed 10 N/mm² per second.

2.3.6 A measured elongation value is to be regarded as valid only if the fracture occurs within the gauge length and at least the following distances from the gauge marks:

Round test specimen: 1,25d

Flat test specimen: a plus width of specimen

The measurement is valid irrespective of the position of the fracture, if the percentage elongation after fracture reaches at least the specified value, and this is to be stated in the test report.

2.4 Equivalent elongations

2.4.1 When a gauge length other than $5,65 \sqrt{S_o}$ is used, the equivalent percentage elongation value is to be calculated using the following formula:

$$A = \frac{A_R}{2} \left(\frac{L_o}{\sqrt{S_o}} \right)^{0,40}$$

where

A_R = actual measured percentage elongation of test specimen

S_o = actual cross-sectional area of test specimen

L_o = actual gauge length of test piece

A = equivalent percentage elongation for a test specimen with a gauge length of $5,65 \sqrt{S_o}$

2.4.2 Alternatively, where a number of test specimens of similar material and dimensions are involved, the actual percentage elongation values may be recorded, provided that the equivalent specified minimum elongation value appropriate for the test specimen dimensions is calculated from the formula in 2.4.1 and is recorded on the test certificate.

2.4.3 For proportional test specimens having a gauge length other than $5,65 \sqrt{S_o}$, the equivalent elongation may be calculated using the following factors (d is the diameter of the test specimen):

Actual gauge length	Factor for equivalent elongation on $5,65 \sqrt{S_o}$
$4 \sqrt{S_o}$	x 0,870
$8,16 \sqrt{S_o}$	x 1,158
$11,3 \sqrt{S_o}$	x 1,317
$4d$	x 0,916
$8d$	x 1,207

2.4.4 For non-proportional test specimens with gauge lengths of 50 mm and 200 mm, the equivalent elongation values tabulated in ISO 2566 are to apply.

2.4.5 The above conversions are reliable only for carbon, carbon-manganese and low alloy steels with a tensile strength not exceeding 700 N/mm² in the hot rolled, annealed, normalised, or normalised and tempered condition.

2.4.6 For alloy steels in the quenched and tempered condition, the following conversions may be used for proportional test specimens with a gauge length of $4 \sqrt{S_o}$:

Actual percentage elongation on $4 \sqrt{S_o}$	Equivalent elongation on $5,65 \sqrt{S_o}$
22	17
20	15
18	13
17	12
16	12
15	11
14	10
12	8
10	7
8	5

2.4.7 Any proposals to use conversion factors for equivalent elongation values for the following materials are to be agreed with the Surveyors:

- Carbon, carbon-manganese and alloy steels in the normalised or normalised and tempered condition with a tensile strength exceeding 700 N/mm².
- Cold-worked steels.
- Austenitic stainless steels.
- Non-ferrous alloys.

2.5 Procedure for testing at elevated temperatures

2.5.1 The test specimens used for the determination of lower yield or 0,2 per cent proof stress at elevated temperatures are to have an extensometer gauge length of not less than 50 mm and a cross-sectional area of not less than 65 mm². Where, however, this is precluded by the dimensions of the product or by the test equipment available, the test specimen is to be of the largest practicable dimensions.

2.5.2 The heating apparatus is to be such that the temperature of the specimen during testing does not deviate from that specified by more than $\pm 5^\circ\text{C}$.

Testing Procedures for Metallic Materials

Chapter 2

Sections 2, 3 & 4

2.5.3 The straining rate when approaching the lower yield or proof load is to be controlled within the range 0,1 to 0,3 per cent of the extensometer gauge length per minute.

2.5.4 The time intervals used for estimation of strain rate from measurements of strain are not to exceed 6 seconds.

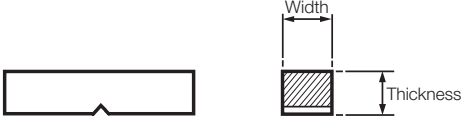

Section 3
Impact tests

3.1 Dimensions of test specimens

3.1.1 Impact tests are to be of the Charpy V-notch type. The test specimens are to be machined to the dimensions and tolerances given in Table 2.3.1 and are to be carefully checked for dimensional accuracy.

Table 2.3.1 Dimensions and tolerances for Charpy V-notch impact test specimens

Dimension	Nominal	Tolerance
Length, mm	55	±0,60
Width, mm– standard specimen	10	±0,11
– standard subsidiary specimen	7,5	±0,11
– standard subsidiary specimen	5	±0,06
Thickness, mm	10	±0,06
Angle of notch	45°	±2°
Depth below notch, mm	8	±0,06
Root radius, mm	0,25	±0,025
Distance of notch from end of test specimen, mm	27,5	±0,42
Angle between plane of symmetry of notch and longitudinal axis of test specimen	90°	±2°

3.1.2 For material under 10 mm in thickness, the largest possible size of standard subsidiary Charpy V-notch test specimen is to be prepared with the notch cut on the narrow face. Generally, impact tests are not required when the thickness of the material is less than 6 mm.

3.2 Testing procedures

3.2.1 All impact tests are to be carried out on Charpy machines approved by Lloyd’s Register (hereinafter referred as LR) and having a striking energy of not less than 150 J.

3.2.2 Charpy V-notch impact tests may be carried out at ambient or lower temperatures in accordance with the specific requirements given in subsequent Chapters of these Rules. Where the test temperature is other than ambient, the temperature of the test specimen is to be controlled to within ±2°C for sufficient time to ensure uniformity throughout the cross-section of the test specimen, and suitable precautions are to be taken to prevent any significant change in temperature during the actual test. In cases of dispute, ambient temperature is to be considered as 18°C to 25°C.

3.2.3 For acceptance, the average energy value for a set of three impact tests must be equal to or greater than the appropriate specified minimum average value. Additionally, only one individual value may be less than the required average value but not less than 70 per cent of this average value.

3.2.4 Where standard subsidiary Charpy V-notch test specimens are necessary, the minimum energy values required are to be reduced as follows:

- Specimen 10 x 7,5 mm: 5/6 of tabulated energy.
- Specimen 10 x 5 mm: 2/3 of tabulated energy.

3.2.5 When reporting results, the specimen dimensions and the units used for expressing the energy absorbed (Joules) and the testing temperature are to be clearly stated.

Section 4
Ductility tests for pipes and tubes

4.1 Bend tests

4.1.1 The test specimens are to be cut as circumferential strips of full wall thickness and with a width of not less than 40 mm. For thick walled pipes, the thickness of the test specimens may be reduced to 20 mm by machining. The edges of the specimens may be rounded to a radius of 1,6 mm.

4.1.2 Testing is to be carried out at ambient temperature, and the specimens are to be doubled over a former whose diameter is to be in accordance with the specific requirements for the material. For submerged arc welded tube the test piece is to be bent with the root of the weld in tension. For other tubes, the test piece is to be bent in the original direction of curvature. In all cases, the welds are to be in the middle of the test specimen. The test is considered to be satisfactory if, after bending, the specimens are free from cracks and laminations. Small cracks at the edges of the test specimens are to be disregarded.

4.2 Flattening tests

4.2.1 Ring test specimens are to be cut with the ends perpendicular to the axis of the pipe or tube. The length of the specimen is to be equal to 1,5 times the external diameter of the pipe or tube, but is to be not less than 10 mm or greater than 100 mm. Alternatively, the length of the test specimen may be 40 mm irrespective of the external diameter.

Testing Procedures for Metallic Materials

Chapter 2

Section 4

4.2.2 Testing is to be carried out at ambient temperature and is to consist of flattening the specimens in a direction perpendicular to the longitudinal axis of the pipe. Flattening is to be carried out between two plain parallel and rigid platens which extend over both the full length and the width after flattening of the test specimen. Flattening is to be continued until the distance between the platens, measured under load, is not greater than the value given by the formula:

$$H = \frac{t(1+C)}{C + \frac{t}{D}}$$

where

H = distance between plates, in mm

t = specified thickness of the pipe, in mm

D = specified outside diameter, in mm

C = a constant dependent on the steel type and detailed in the specific requirements

After flattening, the specimens are to be free from cracks or other flaws. Small cracks at the ends of the test specimens may be disregarded.

4.2.3 For welded pipes or tubes, the weld is to be placed at 90° to the direction of flattening.

4.3 Drift expanding tests

4.3.1 The test specimens are to be cut with the ends perpendicular to the axis of the tube. The edges of the end to be tested may be rounded by filing.

4.3.2 For metallic tubes, the length of the specimen is to be at least 1.5 times the external diameter of the tube except when a mandrel with an included angle of 30° is used, in which case the length of the specimen is to be twice the external diameter of the tube. In all cases the length of section remaining cylindrical after test is not be less than 0.5 times the external diameter.

4.3.3 Testing is to be carried out at ambient temperature and is to consist of expanding the end of the tube symmetrically by means of a hardened conical steel mandrel having a total included angle of 30°, 45° or 60°, see Fig. 2.4.1. The mandrel is to be forced into the test specimen at a rate not exceeding 50 mm/min until the percentage increase in the outside diameter of the end of the test specimen is not less than the value given in the specific requirements for boiler and superheater tubes, see Chapter 6. The mandrel is to be lubricated, but there is to be no rotation of the tube or mandrel during the test. The expanded portion of the tube is to be free from cracks or other flaws.

4.4 Flanging tests

4.4.1 The test specimens are to be cut with the ends perpendicular to the axis of the tube. The length of the specimens is to be at least equal to the external diameter of the tube and such that after testing the portion that remains cylindrical is not less than half the external diameter. The edges of the end to be tested may be rounded by filing.

4.4.2 Testing is to be carried out at ambient temperature and is to consist of flanging the end of the tube symmetrically by means of hardened conical steel mandrels. The rate of flanging is not to exceed 50 mm/min.

4.4.3 The first stage of flanging is to be carried out with a conical angled mandrel having an included angle of approximately 90°, see Fig. 2.4.2(a). The completion of the test is achieved with a second forming tool as shown in Fig. 2.4.2(b). The mandrels are to be lubricated and there is to be no rotation of the tube or mandrels during the test. The test is to continue until the drifted portion has formed a flange perpendicular to the axis of the test specimens. The percentage increase in the external diameter of the end of the specimens is to be not less than the value given in the specific requirements for boiler and superheater tubes, see Chapter 6. The cylindrical and flanged portion of the tube is to be free from cracks or other flaws.

Testing Procedures for Metallic Materials

Chapter 2

Sections 5 & 6

Section 5

Embrittlement tests

5.1 Temper embrittlement tests

5.1.1 The test material is to be heat treated in accordance with the specification except that after tempering:

- half the material is to be water quenched;
- the other half is to be cooled from the tempering temperature to 300°C at a rate not exceeding 10°C per minute.

5.1.2 Impact tests in accordance with Section 3 are to be made on the material in each condition at temperatures over a range wide enough to establish the upper and lower shelf energies and temperatures, tests being made at no less than three intermediate temperatures.

5.1.3 A set of three specimens is to be tested at each temperature. The results are to be plotted separately for each condition, in the form illustrated in Fig. 2.5.1. In addition, the test temperatures, proportions of crystallinity and absorbed energies for all the specimens tested are to be reported.

Fig. 2.5.1 Idealised transition curve

5.1.4 The transition temperature for each condition is to be taken as the mid-temperature of the fracture transition zone. The difference between the two transition temperatures is to be reported.

5.2 Strain age embrittlement tests

5.2.1 The test material is to be heat treated in accordance with the specification and then subjected to five per cent strain. Half of the test material is then to be heated to 250°C and held for one hour.

5.2.2 Impact tests in accordance with 5.1.2 are to be made in both the strained and unstrained conditions.

5.2.3 The tests are to comply with 5.1.3.

5.2.4 The test results are treated in accordance with 5.1.4.

5.3 Hydrogen embrittlement tests

5.3.1 Two specimens are to be tested. The specimens are to be of a diameter of 20 mm. Where this is not practicable a diameter of 14 mm may be accepted.

5.3.2 One specimen is to be tested within a maximum of 3 hours after machining. Where the specimen diameter is 14 mm, the time limit is 1.5 hours. Alternatively, the specimen may be cooled to -60°C immediately after machining and kept at that temperature for a maximum period of 5 days before being tested.

5.3.3 The other specimen is to be tested after baking at 250°C for 4 hours. Where the specimen diameter is 14 mm the baking time is to be 2 hours.

5.3.4 A strain rate not exceeding 0,0003s⁻¹ is to be used during the entire test, until fracture occurs.

5.3.5 Tensile strength, elongation and reduction of area are to be reported.

5.3.6 The ratio Z_1/Z_2 is to be reported, where Z_1 is the reduction in area without baking and Z_2 the reduction in area after baking.

Section 6

Crack tip opening displacement tests

6.1 Dimensions of test specimens

6.1.1 Unless agreed otherwise, tests are to be made on specimens of the full section thickness and which conform to a nationally agreed standard.

6.1.2 Normally the specimens are to be rectangular with the main dimensions as indicated in Fig. 2.6.1 and are to be tested in three point bending.

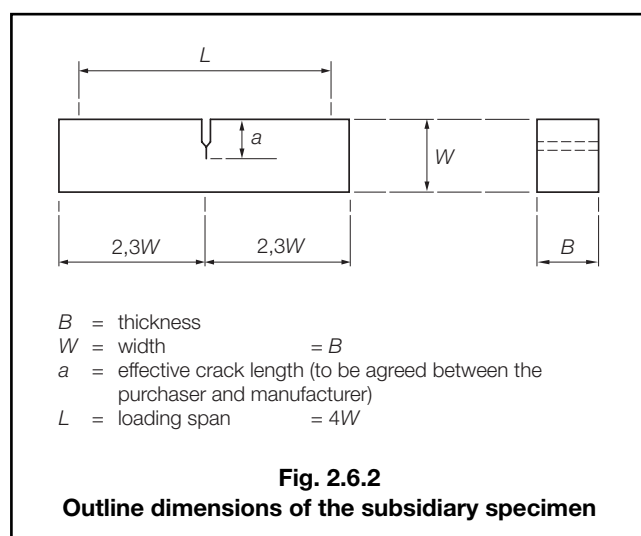

6.1.3 A subsidiary specimen as in Fig. 2.6.2 may be used by agreement.

6.1.4 In each case the notch is to be positioned at the centre of the loading span; its root radius is not to exceed 0,10 mm. The notch is to be extended by the generation of a fatigue crack to give an effective crack length of the dimension a . For this purpose, the fatigue stress ratio, R_1 , is to be within the range 0 to 0,1 and the fatigue intensity is not to exceed $0,63\sigma_y B^{1/2}$ where σ_y is the 0,2 per cent proof stress at the test temperature.

Testing Procedures for Metallic Materials

Chapter 2

Section 6

6.2 Test equipment

6.2.1 Whenever possible, tests are to be made using machines operating under displacement control. The type of control is to be recorded.

6.2.2 The test equipment is to be calibrated annually.

6.2.3 The crack opening displacement gauge is to have an accuracy of at least one per cent. It is to be calibrated at least once every day of testing and at intervals of no more than 10 tests. It should be demonstrated that the calibration is satisfactory for the test conditions.

6.3 Testing procedures

6.3.1 Tests are to be made in a recognised test house in accordance with a nationally accepted standard.

6.3.2 Unless otherwise agreed, all tests on unwelded wrought material are to be made on specimens taken transverse to the principal working direction and are to be through-thickness notched.

6.3.3 Where tests are made on weld material, the fatigue crack should be arranged to sample the maximum amount of unrefined weld metal.

6.3.4 Where tests are made on the Heat Affected Zone (H.A.Z.) of a weld, a K or single bevel weld preparation is recommended. The region of lowest fracture toughness in the Heat Affected Zone should be identified for the particular steel and weld procedure by means of preliminary tests. The fatigue crack is to be accurately positioned to sample as high a proportion of this critical region as possible and after testing has been completed, the specimen is to be sectioned to check that this has been achieved. Sufficient tests should be made to ensure that the critical region has been sampled in at least three specimens.

6.3.5 At least three valid tests are to be made for each material condition. Invalid tests are to be disregarded and the tests repeated.

6.3.6 Local pre-compression of the test specimen ahead of the notch is acceptable in order to provide an acceptably even fatigue crack front.

6.3.7 The temperature of the test piece is to be measured to within $\pm 2^\circ\text{C}$ over the range minus 196°C to $+200^\circ\text{C}$ and to within $\pm 5^\circ\text{C}$ outside this range. The temperature should be measured at a point on the specimen not farther than 2 mm away from the crack tip.

6.4 Validity requirements

- 6.4.1 The test is to be regarded as invalid if:
- the fatigue crack front is not in a single plane;
 - any part of the fatigue crack surface lies in a plane whose angle with the plane of the notch exceeds 10° ;
 - the length of any part of the fatigue crack is less than $0,025W$ or 1,25 mm, whichever is the greater;
 - the difference between the maximum and minimum lengths of the fatigue crack exceeds $0,1W$;
 - the difference between any two of the lengths of the fatigue crack at $0,25B$, $0,5B$ and $0,75B$ exceeds $0,05W$.

6.4.2 In addition, for tests on welds and Heat Affected Zones (H.A.Z.), the following criteria are to be complied with:

- Weld metal. The fatigue crack front shall not extend outside the weld metal deposit and 80 per cent should be within 2 mm of the fusion line.
- Grain coarsened H.A.Z.. The fatigue crack should be within 0,5 mm of the fusion line and should sample all of the grain coarsened H.A.Z. present. However, if fusion line irregularities prevent this, a sample including as much grain coarsened H.A.Z. as possible may be accepted.
- Subcritical/intercritical H.A.Z. boundary. The fatigue crack is to sample the boundary between the subcritical and intercritical regions of the H.A.Z. However, if fusion line irregularities prevent this, a sample including as much relevant microstructure as possible may be accepted.

Testing Procedures for Metallic Materials

Chapter 2

Sections 6 & 7

6.5 Test reports

6.5.1 The test report is to include:

- details of the material, its condition and size;
- the thickness and width of the test specimen;
- the fatigue pre-cracking conditions;
- the test temperature and environment;
- the test machine control system and rate of change of displacement or load;
- crack length measurements;
- force/displacement records, preferably in the form of an autographic record;
- the critical crack opening displacement;
- a photograph of the fracture;
- any observation on the fracture surface.

Section 7 Bend tests

7.1 Dimensions of test specimens

7.1.1 Flat bend test specimens are to be of rectangular cross-section with dimensions as defined in Fig. 2.7.1.

Fig. 2.7.1 Bend test specimen

7.1.2 For plates, sections and strip the dimensions shall be full thickness and width 30 mm. Where the rolled thickness exceeds 25 mm the compression face may be reduced to 25 mm.

7.1.3 For forgings, castings and semi-finished products the thickness shall be 20 mm and width 25 mm.

7.1.4 Butt weld face and root bend test specimens are to be 30 mm in width and of the full plate thickness. Where the thickness exceeds 25 mm, two side bend test specimens may be tested in place of the face and root specimens specified. The side bend specimens should be 10 mm minimum thickness. The upper and lower surfaces of the weld are to be filed, ground or machined flush with the surface of the plate.

7.1.5 The edges on the tension side of bend samples are to be rounded to a radius of 1 to 2 mm.

7.2 Testing procedures

7.2.1 The bend sample is plastically deformed by plunging a mandrel between two fixed points as shown in Fig. 2.7.2.

Fig. 2.7.2 Bend test

7.2.2 For aluminium welds a guided bend is required to ensure even deformation as shown in Fig. 2.7.3.

Fig. 2.7.3 Guide bend test for aluminium

7.2.3 Bend tests are to be conducted at ambient temperature at the highest convenient rate of bending (but not impact).

■ Section 8

Corrosion tests

8.1 Intergranular corrosion test

8.1.1 For all products other than pipes, the material for the test specimens is to be taken adjacent to that for the tensile test and is to be machined to suitable dimensions for either a round or rectangular section bend test. The diameter or thickness is to be not more than 12 mm, and the total surface area is to be between 1500 mm² and 3500 mm².

8.1.2 For pipes with an outside diameter not exceeding 40 mm, the test specimens are to consist of a full cross-section. For larger pipes, the test specimens are to be cut as circumferential strips of full wall thickness and having a width of not less than 12,5 mm. In both cases the total surface area is to be between 1500 mm² and 3500 mm².

8.1.3 Specimens are to be heated to a temperature of 700 ± 10°C for 30 minutes, followed by rapid cooling in water. They are then to be placed on a bed of copper turnings (50 g per litre of test solution) and immersed for 15 to 24 hours in a boiling solution of the following composition:

- 100 g of hydrated copper sulphate granules (CuSO₄ · 5H₂O)
- 184 g (100 ml) sulphuric acid (density 1,84 g/ml) added dropwise to distilled water to make 1 litre of solution.

Precautions are to be taken during boiling to prevent concentration of the solution by evaporation.

8.1.4 After immersion, the full cross-section test specimens from pipes are to be subjected to a flattening test in accordance with Ch 2,4.2. All other test specimens are to be bent, at ambient temperature, through 90° over a former with a diameter equal to twice the diameter or thickness of the test specimen.

8.1.5 After flattening or bending, the test specimens are to be free from cracks on the outer, convex surface.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 1

Section

- 1 **General requirements**
- 2 **Normal strength steels for ship and other structural applications**
- 3 **Higher strength steels for ship and other structural applications**

Section 1 General requirements

1.1 Scope

1.1.1 This Section gives the general requirements for hot rolled plates and sections intended for use in the construction of ships, other marine structures, machinery, boilers and pressure vessels.

1.1.2 This Chapter is not applicable to hot rolled bars intended for the manufacture of bolts, plain shafts, etc., by machining operations only. Where used for this purpose, hot rolled bars are to comply with the requirements of Chapter 5.

1.1.3 Plate and strip which is hot coiled after rolling and subsequently uncoiled, cold flattened and cut to the required dimensions are also subject to the appropriate requirements of this Chapter.

1.1.4 Plates, strip, sections and bars are to be manufactured and tested in accordance with the requirements of Chapters 1 and 2, the general requirements of this Section and the appropriate specific requirements given in Sections 2 to 10.

1.1.5 As an alternative to 1.1.4, materials which comply with National or proprietary specifications may be accepted, provided that these specifications give equivalence to the requirements of this Chapter or are approved for a specific application. Particular attention is to be taken of the minimum required under thickness tolerance, see 1.5. Generally, survey and certification of such materials are to be carried out in accordance with the requirements of Chapter 1.

1.2 Steel with guaranteed through thickness properties – 'Z' grade steel

1.2.1 When plate material, intended for welded construction, will be subject to significant strains in a direction perpendicular to the rolled surfaces, it is recommended that consideration be given to the use of special plate material with specified through thickness properties, 'Z' grade steel. These strains are usually associated with thermal contraction and restraint during welding, particularly for full penetration 'T'-butt welds, but may also be associated with loads applied in service or during construction. Where these strains are of sufficient magnitude, lamellar tearing may occur. Requirements for 'Z' grade plate material are detailed in Section 8. It is the responsibility of the fabricator to make provision for the use of this material.

1.2.2 Steels intended to have guaranteed through thickness properties will include the supplementary suffix Z25 or Z35 in the designation, for example: LR DH36 Z35.

1.3 Manufacture

1.3.1 All materials are to be manufactured at works which have been approved by LR for the type and grade of steel which is being supplied and for the relevant steelmaking and processing route.

1.3.2 Steel is to be cast in metal ingot moulds or by the continuous casting process. The size of the ingot, billet or slab is to be proportional to the dimensions of the final product such that the reduction ratio is normally to be at least 3 to 1. Sufficient discard is to be taken to ensure soundness in the portion used for further processing.

1.3.3 The cast analysis to be used for certification purposes is to be determined after all alloying additions have been carried out and sufficient time allowed for such an addition to homogenise.

1.3.4 Material may be supplied either as-rolled, normalised, normalising rolled, or thermomechanically controlled rolled. The following definitions apply:

- (a) As-rolled (AR) refers to products that are supplied without any heat treatment after completion of the rolling operations. The rolling temperature and reduction may not be strictly controlled resulting in a variable grain size.
- (b) Normalising (N) is a separate austenitising heat treatment after rolling which refines the grain size, improving the mechanical properties.
- (c) Normalising rolling (NR) is a procedure in which the final deformation is carried out in the normalising temperature range resulting in a material condition equivalent to that obtained by normalising. Normalising rolling may, therefore, be acceptable as a direct equivalent of a normalising heat treatment.
- (d) Thermomechanically controlled rolling (TM) is a procedure in which both the temperatures and thickness reductions are strictly controlled and in which rolling is completed at a specified temperature close to, and may be less than, that at which ferrite formation is complete. This results in a microstructure and mechanical properties which cannot be obtained by a normalising heat treatment.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 1

(e) Quenching and Tempering (QT) involves quenching, a heat treatment process in which steel is heated to an appropriate temperature above the A_{c3} and then cooled with an appropriate coolant for the purpose of hardening the microstructure, followed by tempering, a process in which the steel is re-heated to an appropriate temperature, not higher than the A_{c1} to restore the toughness properties by improving the microstructure.

1.3.5 Where material is being produced by a normalising rolling or a thermomechanically controlled process (T.M.) an additional program of tests for approval is to be carried out under the supervision of the Surveyors and the results are to be to the satisfaction of Lloyd's Register (hereinafter referred to as 'LR').

1.3.6 The mechanical properties may be improved by means of accelerated cooling which involves controlled cooling, at rates higher than are obtained by air cooling, after the final rolling operation. Materials may be supplied in this condition subject to approval by LR. Accelerated cooling does not include quenching and the mechanical properties conferred by it cannot be reproduced by subsequent normalising or other heat treatment.

1.3.7 Weldable high strength steels may be supplied in the quenched and tempered condition for other marine structures, see Section 10.

1.4 Quality of materials

1.4.1 Surface and internal imperfections not prejudicial to the proper application of the steel are not, except by special agreement, to be grounds for rejection. Where necessary, suitable methods of non-destructive examination may be used for the detection of harmful surface and internal defects. The extent of this examination, together with an appropriate acceptance standard, is to be agreed between the purchaser, steelmaker and Surveyor and is to be included in the manufacturing specification.

1.5 Dimensional tolerances

1.5.1 For materials intended for hull structural purposes as detailed in Sections 2, 3 and 10, the under thickness tolerance of plates, strip and wide flats is not to exceed 0,3 mm.

1.5.2 The minus tolerance on sections (except for wide flats) is to be in accordance with the requirements of a recognised National or International Standard.

1.5.3 The attention of Shipbuilders and Owners is to be drawn to the fact that when thickness gauging is carried out during the ship's life, estimation of the diminution of hull plating and structure will be based on the nominal thickness, this being the original approved thickness for the item of structure under consideration.

1.5.4 The under thickness tolerance acceptable for classification is to be considered as the lower limit of a range of thickness tolerance which could be found in the normal production of a conventional rolling mill manufacturing material, on average, to the nominal thickness.

1.5.5 The Shipbuilder and Owner may agree in individual cases whether they wish to specify a more stringent under thickness tolerance than that given in 1.5.1.

1.5.6 The minus tolerances for plates and wide flats intended for machinery structures are given in Section 5.

1.5.7 For materials intended for applications as detailed in Sections 4 and 6, no minus tolerance is permitted in the thickness of plates and strip. The minus tolerances on sections are to comply with the requirements of a recognised National or International Standard.

1.5.8 For the materials detailed in Section 7, the under thickness tolerance of material intended for use in the construction of cargo tanks is not to exceed 0,3 mm. For other applications, no minus tolerance is permitted in the thickness of plates and strip.

1.5.9 Dimensional tolerances for material detailed in Section 9 are given in Table 3.9.3.

1.5.10 The thickness of plates and strip is to be measured at random locations whose distance from a longitudinal edge is to be at least 10 mm. Local surface depressions resulting from imperfections and ground areas resulting from the elimination of defects may be disregarded provided that they are in accordance with the requirements of a recognised National or International Standard.

1.5.11 Tolerances relating to length, width, flatness and over thickness are to comply with a National or International Standard.

1.5.12 The responsibility for maintaining the required tolerances and making the necessary measurements rests with the manufacturer. Occasional checking by the Surveyor does not absolve the manufacturer from this responsibility.

1.6 Heat treatment

1.6.1 Acceptable conditions of supply are specified in subsequent Sections of this Chapter.

1.6.2 The manufacturer is to carry out any heat treatment which may be necessary to prevent hydrogen cracking or to make the material in a safe condition for transit. The Surveyor is to be advised of any heat treatment proposed.

1.6.3 Where material is manufactured using a thermomechanically controlled process consideration must be given to the possibility of consequent reduction in mechanical properties if it is subjected to heating for forming or stress relieving or is welded using a high heat input.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 1

1.7 Test material and mechanical tests

1.7.1 Depending on the type of product, provision is made in subsequent Sections of this Chapter for the testing of individual items or for batch testing. Where the latter is permitted, all materials in a batch presented for acceptance tests are to be of the same product form, (e.g. plates, flats, sections, etc.), from the same cast and in the same condition of supply.

1.7.2 The test samples are to be fully representative of the material and, where appropriate, are not to be cut from the material until heat treatment has been completed. The test specimens are not to be separately heat treated in any way.

1.7.3 The test material is to be taken from the thickest piece in each batch.

1.7.4 Test material is to be taken from the following positions:

- (a) At the square cut end of plates and flats greater than 600 mm wide, approximately one-quarter width from an edge, see Fig. 3.1.1(a).
- (b) For flats 600 mm or less in width, bulb flats and other solid sections, at approximately one-third of the width from an edge, see Fig. 3.1.1(b), (c) and (d). Alternatively, in the case of channels, beams or bulb angles, at approximately one-quarter of the width from the centreline of the web, see Fig. 3.1.1(c).
- (c) For rectangular hollow sections, at approximately the centre of any side, see Fig. 3.1.1(e). For circular hollow sections, at any position on the periphery.
- (d) For bars intended for purposes as detailed in Sections 2, 3, 5 and 9, at approximately one-third of the radius or half-diagonal from the outer surface, see Fig. 3.1.1(f). For smaller bars, the position of the test material is to be as close as is possible to the above.
- (e) For bars intended for the applications detailed in Sections 4, 6 and 7 at approximately 12.5 mm below the surface. For bars up to 25 mm diameter, the test specimens may be machined coaxially.
- (f) For plates and flats with thicknesses in excess of 40 mm, full thickness specimens may be prepared, but when instead a machined round specimen is used then the axis is to be located at a position lying one-quarter of the product thickness from the surface as shown in Fig. 3.1.1(g).

1.7.5 Tensile test specimens and impact test specimens, where required for the type and grade of product being supplied, are to be prepared from each item or batch of material submitted for acceptance.

1.7.6 Where the finished width of plates and flats is greater than 600 mm, the tensile test specimens are to be cut with their principal axes perpendicular to the final direction of rolling. For all other rolled products, the principal axes are to be parallel to the final direction of rolling.

1.7.7 The tensile test specimens are to be machined to the dimensions detailed in Ch 2, 2.1.6 and 2.1.7.

1.7.8 Impact test specimens are to be cut with their principal axes either parallel (longitudinal test) or perpendicular (transverse test) to the final direction of rolling, as required by subsequent Sections of this Chapter. Where both longitudinal and transverse impact properties are shown for a particular grade, only the longitudinal test is required to be carried out, unless otherwise specified by the purchase order or subsequent Sections of this Chapter. However, for plates and wide flats, by certifying that the product meets the requirements of the Rules, the manufacturer guarantees that the acceptance values will be met if tested in the transverse direction. The Surveyor may request testing in this direction to confirm conformity.

1.7.9 Impact test specimens are to be of the Charpy V-notch type, machined to the dimensions detailed in Chapter 2. They are to be taken from a position within 2 mm of one of the rolled surfaces, except that for plates and sections over 40 mm thick, the axes of the test specimens are to be at one-quarter of the thickness from one of the rolled surfaces. For bars and other similar products the axes of the test specimens are to be as specified in 1.7.4(d).

1.7.10 Standard test specimens 10 mm square are to be used, except where the thickness of the material does not allow this size of test specimen to be prepared. In such cases the largest possible size of subsidiary test specimen, in accordance with Table 2.3.1 is to be prepared, with the notch cut on the narrow face. Alternatively, for material of suitable thickness, the rolled surfaces may be retained so that the test specimen width will be the full thickness of the material. In such cases the tolerances for width given in Table 2.3.1 in Chapter 2 are not applicable. The notch is to be cut in a face of the test specimen which was originally perpendicular to the rolled surface. The position of the notch is to be not nearer than 25 mm to a flame-cut or sheared edge.

1.7.11 Impact tests are not required when the nominal material thickness is less than 6 mm.

1.7.12 The test procedures used for all tensile and impact tests are to be in accordance with the requirements of Chapter 2.

1.8 Visual and non-destructive examination

1.8.1 Surface inspection and verification of dimensions are the responsibility of the steelmaker and are to be carried out on all material prior to despatch. Acceptance by the Surveyors of material later found to be defective shall not absolve the steelmaker from this responsibility.

1.8.2 With the exception of 'Z' grade plate material (see Section 8) and bars for offshore mooring cable (see Section 9), the non-destructive examination of materials is not required for acceptance purposes, see also 1.4.1. However, manufacturers are expected to employ suitable methods of non-destructive examination for the general maintenance of quality standards.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 1

1.9 Rectification of defects

1.9.1 For materials intended for structural purposes as detailed in Sections 2, 3 and 5, surface defects may be removed by local grinding provided that:

- (a) the thickness is in no place reduced to less than 93 per cent of the nominal thickness, but in no case by more than 3 mm,
- (b) each single ground area does not exceed 0,25 m²,
- (c) the total area of local grinding does not exceed two per cent of the total surface,
- (d) the ground areas have smooth transitions to the surrounding surface.

Where necessary, the entire surface may be ground to a maximum depth as given by the underthickness tolerances of the product. The extent of such rectification is to be agreed in each case with the Surveyors and is to be carried out under their supervision, unless otherwise agreed. They may request that complete removal of the defect is proven by suitable non-destructive examination of the affected area.

1.9.2 Surface defects which cannot be dealt with as in 1.9.1 may be repaired by chipping or grinding followed by welding, subject to the Surveyor's consent and under his supervision, provided that:

- (a) after removal of the defect and before welding, the thickness of the item is in no place reduced by more than 20 per cent,
- (b) each single weld does not exceed 0,125 m²,
- (c) the total area of welding does not exceed two per cent of the surface of the side involved,
- (d) the distance between any two welds is not less than their average width,
- (e) the welds are of reasonable size and made with an excess layer of beads which is then ground smooth to the surface level,
- (f) elimination of the defect is proven by suitable non-destructive examination of the affected area,
- (g) welding is carried out by an approved procedure and by competent operators using approved electrodes and the repaired area is ground smooth to the correct nominal thickness,
- (h) when requested by the Surveyor, the item is normalised or otherwise suitably heat treated after welding and grinding, and
- (j) at the discretion of the Surveyor, the repaired area is proven free from defects by suitable non-destructive examination.

1.9.3 For materials intended for applications as detailed in Sections 4, 6 and 7, surface defects may be removed by grinding in accordance with 1.9.1, except that when the thickness is reduced below that given in the approved plans, acceptance will be subject to special consideration. Weld repairs may also be carried out generally in accordance with 1.9.2, except that in all cases suitable heat treatment after welding and non-destructive testing of the repaired areas is required. The fabricator is to be advised regarding the position and extent of all repairs.

1.9.4 For plates which have been produced by a T.M. process or by normalising rolling, repair by welding will be approved by the Surveyor only after procedure tests have shown that the mechanical properties have not been impaired.

1.9.5 Cracks, shells, sand patches and sharp edged seams are always considered defects which would impair the end use of the product and which require rejection or repair irrespective of their size and number. The same applies to other imperfections exceeding the acceptable limits.

1.10 Identification of materials

1.10.1 Every finished item is to be clearly marked by the manufacturer in at least one place with LR's brand \mathcal{R} and the following particulars:

- (a) The manufacturer's name or trade mark.
- (b) The grade of steel. The designations given in subsequent Sections of this Chapter may be preceded by the letters 'LR' in order to fully describe the grade, e.g. LR A, LR 490FG, LR LT-FH40, LR 316L, etc.
- (c) When the material complies with the requirements of Section 8, the grade is to include the suffix Z25 or Z35, e.g. LR AH36 Z35.
- (d) Identification number and/or initials which will enable the full history of the item to be traced.
- (e) If required by the purchaser, his order number or other identification mark.

The above particulars, but excluding the manufacturer's name or trade mark where this is embossed on finished products, are to be encircled with paint or otherwise marked so as to be easily recognisable.

1.10.2 Where a number of light materials are securely fastened together in bundles, the manufacturer may brand only the top piece of each bundle or, alternatively, a firmly fastened durable label containing the identification may be attached to each bundle.

1.10.3 In the event of any material bearing LR's brand failing to comply with the test requirements, the brand is to be unmistakably defaced, see also Ch 1,4.9.

1.11 Certification of materials

1.11.1 Each test certificate is to include the following particulars:

- (a) Purchaser's name and order number.
- (b) If known, the contract number for which the material is intended.
- (c) Address to which material is dispatched.
- (d) Name of steelworks.
- (e) Description and dimensions of the material.
- (f) Specification or grade of the steel.
- (g) Identification number of piece, including test specimen number where appropriate.
- (h) Cast number and chemical composition of ladle samples.
- (j) Mechanical test results (not required on shipping statements).
- (k) Condition of supply.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Sections 1 & 2

1.11.2 Before the test certificates are signed by the Surveyor, the steelmaker is required to provide a written declaration stating that the material has been made by an approved process, and that it has been subjected to and has withstood satisfactorily the required tests in the presence of the Surveyor, or an authorised deputy. The following form of declaration will be accepted if stamped or printed on each test certificate with the name of the steelworks and signed by an authorised representative of the manufacturer:

‘We hereby certify that the material has been made by an approved process and satisfactorily tested in accordance with the Rules of Lloyd’s Register’.

1.11.3 When steel is not produced at the works at which it is rolled, a certificate is to be supplied by the steelmaker stating the process of manufacture, the cast number and the chemical composition of ladle samples. The works at which the steel was produced must be approved by LR.

1.11.4 The manufacturer of coiled plate is required to issue a certificate which clearly identifies the material as coil. The certificate issued should include the words; ‘Coils covered by this certificate require further processing at a works approved by Lloyd’s Register before being certified as plate in accordance with the Rules of Lloyd’s Register’ in addition to the requirements of 1.11.2.

1.11.5 The supplier of plate cut from coil is required to issue a certificate which clearly identifies the product as finished plate meeting the requirements of the Rules in accordance with 1.11.2.

1.11.6 The form of certificates produced by computer systems is to be agreed with the Surveyor.

Section 2 Normal strength steels for ship and other structural applications

2.1 Scope

2.1.1 The requirements of this Section are primarily intended to apply to steel plates and wide flats not exceeding 100 mm in thickness and sections and bars not exceeding 50 mm in thickness in Grades A, B, D and E. For greater thicknesses, variations in the requirements may be permitted or required for particular applications.

2.1.2 Additional approval tests may be required to verify the suitability for forming and welding of Grade E plate exceeding 50 mm in thickness.

2.2 Manufacture and chemical composition

2.2.1 The method of deoxidation and the chemical composition of ladle samples are to comply with the requirements given in Table 3.2.1.

Table 3.2.1 Chemical composition and deoxidation practice

Grade	A	B	D	E
Deoxidation	For $t \leq 50$ mm: Any method (for rimmed steel, see Note 1)	For $t \leq 50$ mm: Any method except rimmed steel	For $t \leq 25$ mm: Killed	Killed and fine grain treated with aluminium
	For $t > 50$ mm: Killed	For $t > 50$ mm: Killed	For $t > 25$ mm: Killed and fine grain treated with aluminium	
Chemical composition % (see Note 5)				
Carbon	0,21 max. (see Note 2)	0,21 max.	0,21 max.	0,18 max.
Manganese	$2,5 \times C\%$ min.	0,80 min. (see Note 3)	0,60 min.	0,70 min.
Silicon	0,50 max.	0,35 max.	0,10 – 0,35	0,10 – 0,35
Sulphur	0,035 max.	0,035 max.	0,035 max.	0,035 max.
Phosphorus	0,035 max.	0,035 max.	0,035 max.	0,035 max.
Aluminium (acid soluble)	—	—	0,015 min. (see Note 4)	0,015 min. (see Note 4)
Carbon + $\frac{1}{6}$ of the manganese content is not to exceed 0,40%				

NOTES

- For Grade A, rimmed steel may only be accepted for sections up to a maximum thickness of 12,5 mm, provided that it is stated on the test certificates or shipping statements to be rimmed steel.
- The maximum carbon content for Grade A steel may be increased to 0,23% for sections.
- Where Grade B is impact tested the minimum manganese content may be reduced to 0,60%.
- The total aluminium content may be determined instead of the acid soluble content. In such cases the total aluminium content is to be not less than 0,020%.
- Where additions of any other elements are made as part of the steelmaking practice, the content is to be recorded.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 2

2.2.2 Small variations from the chemical compositions given in Table 3.2.1 may be allowed for Grade E steel in thicknesses exceeding 50 mm or when any Grade of steel is supplied in a thermo-mechanically controlled processed condition, provided that these variations are documented and approved in advance.

2.2.3 The manufacturer's declared analysis will be accepted subject to occasional checks if required by the Surveyors.

2.2.4 For plate supplied from coil, the chemical analysis can be transposed from the certificate of the coil manufacture onto the re-processor's certificate.

2.3 Condition of supply

2.3.1 All materials are to be supplied in a condition complying with the requirements given in Table 3.2.2. Where alternative conditions are permitted these are at the option of the steelmaker, unless otherwise expressly stated in the order for the material, but a steelmaker is to supply materials only in those conditions for which he has been approved by LR.

Table 3.2.2 Condition of supply

Grade	Thickness mm	Conditions of supply			
A and B	≤50	Any (see Note 1)			
	>50 ≤100	N	NR	TM	(see Note 2)
D	≤35	Any (see Note 1)			
	>35 ≤100	N	NR	TM	(see Note 3)
E	≤100	N		TM	(see Note 4)
N = normalised NR = normalising rolled TM = thermomechanically controlled-rolled					
NOTES 1. 'Any' includes as-rolled, normalised, normalising rolled and thermomechanically controlled-rolled. 2. Plates, wide flats, sections and bars may be supplied in the as-rolled condition, subject to special approval from LR. 3. Sections in Grade D steel may be supplied in thicknesses greater than 35 mm in the as-rolled condition provided that satisfactory results are consistently obtained from Charpy V-notch impact tests. 4. Sections in Grade E steel may be supplied in the as-rolled and normalising rolled conditions provided that satisfactory results are consistently obtained from Charpy V-notch impact tests.					

2.3.2 Where normalising rolling and thermomechanically controlled rolling (T.M.) processes are used, it is the manufacturer's responsibility to ensure that the programmed rolling schedules are adhered to. Where deviation from the programmed rolling schedule occurs, the manufacturer must ensure that each affected piece is tested and that the local Surveyor is informed.

2.3.3 If a steel product supplied in the T.M. condition is to be subjected to heating for forming or stress relieving or is to be welded by a high energy input process, consideration must be given to the possibility of a consequent reduction in mechanical properties.

2.4 Mechanical tests

2.4.1 The results of all tensile tests and the average energy value from each set of three impact tests are to comply with the appropriate requirements given in Table 3.2.3 except where enhanced by the requirements of this Section.

2.4.2 With the exception given in 2.4.4, one tensile test is to be made for each batch presented unless the mass of finished material is greater than 50 tonnes, in which case one test is to be made from a different piece from each 50 tonnes or fraction thereof. Additional tests are to be made for every variation of 10 mm in the thickness or diameter of products from the same cast. For sections, the thickness to be considered is the thickness of the product at the point at which samples are taken for mechanical tests. A piece is to be regarded as the rolled product from a single slab or billet, or from a single ingot if this is rolled directly into plates, strip, sections or bars.

2.4.3 For Grades A and B where plate is supplied from coil, results of the tensile test can be transposed from the certificate of the coil manufacture onto the certificate issued by the re-processor. If the coil mass exceeds 50 tonnes, testing will additionally be required from two locations representing the start and end of the coil. For Grades D and E, the mechanical properties must be sampled from the de-coiled plate in accordance with the frequency specified in the Rules.

2.4.4 For plates of thickness exceeding 50 mm in Grade E steel, one tensile test is to be made on each piece.

2.4.5 For Grade A steel, Charpy V-notch impact tests are not required when the thickness does not exceed 50 mm, or up to 100 mm thick if the material is supplied in either the normalised or thermo-mechanically controlled-rolled condition and has been fine grain treated. However, the manufacturer should confirm, by way of regular in-house checks, that the material will meet a requirement of 27 J at +20°C. The results of these checks shall be reported to the Surveyor. The frequency of these checks should as a minimum be every 250 tonnes.

2.4.6 When Grade A steel is supplied in a thickness greater than 50 mm and either, in the normalising rolled condition, or when special approval has been given to supply in the as-rolled condition, a set of three impact test specimens is to be tested from each batch of 50 tonnes or fraction thereof.

2.4.7 Impact tests are not required for Grade B steel of 25 mm or less in thickness. However, the manufacturer is to confirm, by way of regular in-house tests, and on occasional material selected by the Surveyor, that the material meets the requirement in Table 3.2.3. The results of the tests are to be reported to the Surveyor. The frequency of the in-house checks are to be, as a minimum, one set of three impact test specimens for every 250 tonnes.

Rolled Steel Plates, Strip, Sections and Bars**Chapter 3***Section 2***Table 3.2.3 Mechanical properties for acceptance purposes**

Grade	Yield stress N/mm ² minimum	Tensile strength N/mm ²	Elongation on $5,65\sqrt{S_0}$ % minimum	Charpy V-notch impact test (see Notes 3, 4, 5, 6 and 7)					
				Thickness mm	Average energy J minimum Longitudinal Transverse (see Note 3)				
A	235	400 – 520 (see Note 1)	22 (see Note 2)	≤50	27	20			
B				>50 ≤70	34	24			
D				>70 ≤100	41	27			
E									
Impact tests are to be made on the various grades at the following temperatures:				A grade	20°C				
				B grade	0°C				
				D grade	–20°C				
				E grade	–40°C				
NOTES									
1. For sections in Grade A, the upper limit of the tensile strength range may be exceeded at the discretion of the Surveyor.									
2. For full thickness tensile test specimens with a width of 25 mm and a gauge length of 200 mm (see Fig. 2.2.4 in Chapter 2), the minimum elongation is to be:									
Thickness mm		>5	>10	>15	>20	>25	>30	>35	
		≤5	≤10	≤15	≤20	≤25	≤30	≤35	
								≤50	
Elongation %		14	16	17	18	19	20	21	22
3. Generally, tests need only be made in the longitudinal direction. For special applications, transverse test specimens may be required by the purchaser or LR. Transverse test results for plates and wide flats are to be guaranteed by the supplier.									
4. See 2.4.5 and 2.4.6.									
5. See 2.4.7.									
6. See 1.7.11.									
7. See 2.4.14.									

2.4.8 For Grade B steels of thicknesses above 25 mm, supplied in the as-rolled or normalising rolled condition, one set of three impact test specimens is to be made from the thickest item in each batch presented. If the mass of finished material is greater than 25 tonnes, one extra set of tests is to be made from a different piece from each 25 tonnes or fraction thereof.

2.4.9 For Grade B steels of thicknesses above 25 mm, supplied in the furnace normalised or thermomechanically controlled-rolled condition, one set of three impact test specimens is to be made from the thickest item in each batch presented. If the mass of finished material is greater than 50 tonnes, one extra set of tests is to be made from a different piece from each 50 tonnes or fraction thereof.

2.4.10 For Grade D steels supplied in the as-rolled or normalising rolled condition, one set of three impact test specimens is to be made from the thickest item in each batch presented. If the mass of finished material is greater than 25 tonnes, one extra set of tests is to be made from a different piece from each 25 tonnes or fraction thereof.

2.4.11 For Grade D steels, supplied in the furnace normalised or thermomechanically controlled-rolled condition, one set of three impact test specimens is to be made from the thickest item in each batch presented. If the mass of finished material is greater than 50 tonnes, one extra set of tests is to be made from a different piece from each 50 tonnes or fraction thereof.

2.4.12 For plates in Grade E steel, one set of three impact test specimens is to be made from each piece. For bars and sections in Grade E steel, one set of three test specimens is to be made from each 25 tonnes or fraction thereof. When, subject to the special approval of LR, sections are supplied in the as-rolled or normalising rolled conditions, one set of impact tests is to be taken from each batch of 15 tonnes or fraction thereof.

2.4.13 The results of all tensile tests and the average energy values from each set of three impact tests are to comply with the appropriate requirements given in Table 3.2.3. For impact tests, one individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. See Ch 1.4.6 for re-test procedures.

2.4.14 For batch tested Grade B and D steel plates supplied in a condition other than furnace normalised, with a thickness equal to, or greater than 25 mm and 12 mm respectively, and where the average value of one set of tests is less than 40J, two further items from the same batch are to be selected and tested. If these fail to achieve an average of 40J on either set, each individual piece of the heat is to be tested. The plates are acceptable provided they meet the requirements of Table 3.2.3. Additional testing is not required where the manufacturer can demonstrate to the satisfaction of the Surveyor that the plate was rolled outside the limits of the programmed rolling schedule. In this instance the plate should be rejected, see also 2.3.2.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Sections 2 & 3

2.4.15 Where standard subsidiary Charpy V-notch test specimens are necessary, see Ch 2,3.2.4.

2.5 Identification of materials

2.5.1 The particulars detailed in 1.10 are to be marked on all materials which have been accepted. Where a number of light materials are bundled, the bundle is to be identified in accordance with 1.10.2.

2.6 Certification of materials

2.6.1 At least two copies of each test certificate or shipping statement are to be provided. They are to give the information detailed in 1.11 and, additionally, are to indicate if sections in Grade A steel of rimming quality have been supplied. The chemical composition is to include the content of all the elements detailed in Table 3.2.1.

Section 3 Higher strength steels for ship and other structural applications

3.1 Scope

3.1.1 Provision is made for material to be supplied in four strength levels, 27S, 32, 36 and 40.

3.1.2 The required notch toughness is designated by subdividing the strength levels into Grades AH, DH, EH and FH.

3.1.3 For the designation to fully identify a steel and its properties the appropriate grade letters should precede the strength level number, e.g. AH32 or FH40.

3.1.4 The requirements of this Section are primarily intended to apply to plates, wide flats, sections and bars not exceeding the thickness limits given in Table 3.3.1. For greater thicknesses, variations in the requirements may be permitted or required for particular applications but a reduction of the required impact energy is not allowed.

Table 3.3.1 Maximum thickness limits

Steel designation				Maximum thickness mm	
				Plates and wide flats	Sections and bars
AH 27S	DH 27S	EH 27S	FH27S	100	50
AH 32	DH 32	EH 32	FH32		
AH 36	DH 36	EH 36	FH36		
AH 40	DH 40	EH40	FH40		

3.1.5 It should be noted that the fatigue strength of weldments in steels of high strength levels may not be greater than those of steels of lower strength levels.

3.2 Alternative specifications

3.2.1 Steels differing from the requirements of this Section in respect of chemical composition, deoxidation practice, condition of supply or mechanical properties may be accepted subject to special approval by LR. Such steels are to be given a special designation, see 3.7.2.

3.3 Manufacture

3.3.1 All the grades of steel are to be in the killed and fine grain treated condition.

3.4 Chemical composition

3.4.1 The chemical compositions of ladle samples for all grades of steel are to comply with the requirements given in Table 3.3.2.

3.4.2 The carbon equivalent is to be calculated from the ladle analysis using the formula given below and is not to exceed the maximum value agreed between the fabricator and the steelmaker when the steel is ordered.

$$\text{Carbon equivalent} = C + \frac{\text{Mn}}{6} + \frac{\text{Cr} + \text{Mo} + \text{V}}{5} + \frac{\text{Ni} + \text{Cu}}{15}$$

For TM steels, the agreed carbon equivalent is not to exceed the values given in Table 3.3.3.

3.4.3 The cold cracking susceptibility, P_{cm} , may be used instead of the carbon equivalent for evaluating weldability, in which case the following formula is to be used for calculating the P_{cm} from the ladle analysis:

$$P_{cm} = C + \frac{\text{Si}}{30} + \frac{\text{Mn} + \text{Cr} + \text{Cu}}{20} + \frac{\text{Ni}}{60} + \frac{\text{Mo}}{15} + \frac{\text{V}}{10} + 5B$$

The maximum allowable P_{cm} is to be agreed with LR and is to be included in the manufacturing specification and reported on the certificate.

3.4.4 Small deviations in chemical composition from that given in Table 3.3.2 for plates exceeding 50 mm in thickness in Grades EH36, EH40, FH36 and FH40 may be approved provided that these deviations are documented and approved in advance.

3.4.5 Where the grain refining elements Niobium, Titanium and Vanadium are used either singly or in combination, the chemical composition is to be specifically approved for each Grade in combination with the rolling procedure to be used.

3.4.6 When any grade is supplied in an approved thermomechanically controlled processed condition, variations in the specified chemical composition may be considered, provided that these variations are documented and approved in advance.

3.4.7 For plate supplied from coil, the chemical analysis can be transposed from the certificate of the coil manufacture onto the re-processor's certificate.

Rolled Steel Plates, Strip, Sections and Bars**Chapter 3**

Section 3

Table 3.3.2 Chemical composition

Grades	AH, DH, EH	FH
Carbon % max.	0,18	0,16
Manganese %	0,9 – 1,60 (see Note 1)	0,9 – 1,60
Silicon % max.	0,50	0,50
Phosphorus % max.	0,035	0,025
Sulphur % max.	0,035	0,025
Grain refining elements (see Note 2)		
Aluminium (acid soluble) %	0,015 min. (see Note 3)	
Niobium %	0,02 – 0,05	
Vanadium %	0,03 – 0,10	
Titanium %	0,02 max.	
Total (Nb + V + Ti) % (see Note 5)	0,12 max.	
Residual elements		
Nickel % max.	0,40	0,80
Copper % max.	0,35	0,35
Chromium % max.	0,20	0,20
Molybdenum % max.	0,08	0,08
Nitrogen % max.		0,009 (0,012 max. if Al is present)
NOTES		
1. For AH grade steels in all strength levels and thicknesses up to 12,5 mm, the specified minimum manganese content is 0,70%.		
2. The steel is to contain aluminium, niobium, vanadium or other suitable grain refining elements, either singly or in any combination. When used singly, the steel is to contain the specified minimum content of the grain refining element. When used in combination, the specified minimum content of each element is not applicable.		
3. The total aluminium content may be determined instead of the acid soluble content. In such cases the total aluminium content is to be not less than 0,020%.		
4. Alloying elements other than those listed above are to be included in the approved manufacturing specification.		
5. The grain refining elements are to be in accordance with the approved specification.		

Table 3.3.3 Carbon equivalent requirements for higher tensile strength steels up to 100 mm in thickness when supplied in the TM condition

Grade				Carbon Equivalent, max. (%)	
				$t \leq 50$	$50 < t \leq 100$
AH 27S	DH 27S	EH 27S	FH 27S	0,36	0,38
AH 32	DH 32	EH 32	FH 32	0,36	0,38
AH 36	DH 36	EH 36	FH 36	0,38	0,40
AH 40	DH 40	EH 40	FH 40	0,40	0,42
NOTE t = thickness, in mm.					

3.5 Condition of supply

3.5.1 All materials are to be supplied in a condition complying with the requirements given in Table 3.3.4 or Table 3.3.5. Where alternative conditions are permitted, these are at the option of the steelmaker, unless otherwise expressly stated in the order for the material.

3.5.2 Where normalising rolling and thermomechanically controlled rolling (T.M.) processes are used, it is the manufacturer's responsibility to ensure that the programmed rolling schedules are adhered to. Where deviation from the programmed rolling schedule occurs, the manufacturer must ensure that each affected piece is tested and that the local Surveyor is informed.

3.5.3 The use of precipitation hardening steels is not acceptable, except where such hardening is incidental to the use of grain refining elements.

3.6 Mechanical tests

3.6.1 The results of all tensile tests and the average energy value from each set of three Charpy V-notch impact tests are to comply with the appropriate requirements given in Table 3.3.6 except where enhanced by the requirements of this Section.

Grade	Grain refining practice (see Note 1)	Thickness range mm	Conditions of supply (see Note 2)				
AH 27S AH 32 AH 36	Al or Al + Ti	≤20	AR	N	NR	TM	(see Note 3)
		>20 ≤100	—	N	NR	TM	
	Nb or V or Al + (Nb or V) or Al + (Ti) + (Nb or V)	≤12,5	AR	N	NR	TM	
		>12,5 ≤100	—	N	NR	TM	
AH 40	Any practice	≤12,5	AR	N	NR	TM	
		>12,5 ≤100	—	N	NR	TM	
DH 27S DH 32 DH 36	Al or Al + Ti	≤20	AR	N	NR	TM	(see Note 4)
		>20 ≤100	—	N	NR	TM	
	Nb or V or Al + (Nb or V) or Al + (Ti) + (Nb or V)	≤12,5	AR	N	NR	TM	
		>12,5 ≤100	—	N	NR	TM	
DH 40	Any practice	≤50	—	N	NR	TM	QT
		>50 ≤100	—	N	NR	TM	
EH 27S EH 32 EH 36	Any practice	≤100	—	N	—	TM	
EH 40	Any practice	≤100	—	N	—	TM	QT
FH 27S FH 32 FH 36 FH 40	Any practice	≤100	—	N	—	TM	QT

NOTES

1. Grain refining elements used singly or in any combination, require specific approval from Materials and NDE Department, London office.

2. AR = as-rolled N = furnace normalised NR = normalising rolled
TM = thermomechanically controlled-rolled QT = quenched and tempered

3. Material up to 35 mm thick may be supplied in the as-rolled condition provided that prior approval has been obtained from LR.

4. Material up to 25 mm thick may be supplied in the as-rolled condition provided that prior approval has been obtained from LR.

3.6.4 For steels in the quenched and tempered condition a tensile test is to be made on each plate as heat treated. For continuously heat treated plates, one tensile test is to be made for each 50 tonnes or fraction thereof from a single cast. Additional tests are to be made for every variation of 10 mm in the thickness of the products from a single cast. The tensile test specimens are to be taken with their axes transverse to the main direction of rolling.

3.6.6 For plates and wide flats in the EH and FH grades supplied in the normalised or thermomechanically controlled conditions, one set of impact tests is to be made on each piece. For plates supplied in the quenched and tempered condition a set of impact tests is to be made on each length as heat treated. Test specimens from the quenched and tempered plates are to have their axes transverse to the main rolling direction.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 3

Table 3.3.5 Conditions of supply for sections and bars

Grade	Grain refining practice (see Note 1)	Thickness range mm	Conditions of supply (see Note 2)			
AH 27S AH 32 AH 36	Al or Al + Ti	≤20	Any			
		>20 ≤50	N	NR	TM	(see Note 3)
	Nb or V or Al + Nb or Al + V or Al + (Ti) + (Nb or V)	≤12,5	Any			
		>12,5 ≤50	N	NR	TM	(see Note 3)
AH 40	Any practice	≤12,5	Any			
		>12,5 ≤50	N	NR	TM	
DH 27S DH 32 DH 36	Al or Al + Ti	≤20	Any			
		>20 ≤50	N	NR	TM	(see Note 3)
	Nb or V or Al + Nb or Al + V or Al + (Ti) + (Nb or V)	≤12,5	Any			
		>12,5 ≤50	N	NR	TM	(see Note 3)
DH 40	Any practice	≤50	N	NR	TM	
EH 27S EH 32 EH 36	Any practice	≤50	N	TM		(see Notes 3 and 4)
EH 40	Any practice	≤50	N	TM	QT	
FH 27S FH 32 FH 36 FH 40	Any practice	≤50	N	TM	QT	(see Note 4)

NOTES

- Grain refining elements used singly or in any combination require specific approval from Materials and NDE Department, London Office.
- N = furnace normalised NR = normalising rolled
TM = thermomechanically controlled-rolled QT = quenched and tempered
- Subject to the special approval of LR, sections may be supplied in the as-rolled condition provided satisfactory results are consistently obtained from Charpy V-notch impact tests.
- Subject to the special approval of LR, sections may be supplied in the NR condition.

3.6.7 For sections and bars in the EH and FH grades supplied in the normalised or thermomechanically controlled conditions, one set of impact tests is to be made on the thickest piece in a batch not exceeding 25 tonnes. For sections supplied in the as-rolled or normalising rolled conditions the batch size is not to exceed 15 tonnes.

3.6.8 For batch tested plates in a condition other than furnace normalised, with a thickness equal to 12 mm or greater, and where the average value of one set of tests is less than 50 J, two further items from the same batch are to be selected and tested. If these fail to achieve an average of 50 J on either set, each individual piece of the heat is to be tested. The plates are acceptable provided they meet the requirements of Table 3.3.6. Additional testing is not required where the manufacturer can demonstrate to the satisfaction of the Surveyor that the plate was rolled outside the limits of the programmed rolling schedule. In this instance the plate should be rejected, see also 3.5.2.

3.6.9 Where standard subsidiary impact specimens are necessary, see Ch 2,3.2.4.

3.7 Identification of materials

3.7.1 The particulars detailed in 1.10 are to be marked on all materials which have been accepted and, for ease of recognition, are to be encircled or otherwise marked with paint. Where a number of light products are bundled, the bundle is to be identified in accordance with 1.10.2.

3.7.2 Steels which have been specially approved and which differ from the requirements of this Section are to have the letter 'S' after the agreed identification mark.

3.8 Certification of materials

3.8.1 At least two copies of each test certificate or shipping statement are to be provided. They are to give the information detailed in 1.11 and, additionally, are to state the specified maximum carbon equivalent. The chemical composition is to include the contents of any grain refining elements used and of the residual elements.

Rolled Steel Plates, Strip, Sections and Bars**Chapter 3**

Section 3

Table 3.3.6 Mechanical properties for acceptance purposes (see Note 1)

Grades (see Note 3)	Yield Stress N/mm ² min.	Tensile Strength N/mm ²	Elongation on $5,65\sqrt{S_0}$ % min. (see Note 2)	Charpy V-notch impact tests (see Notes 4 and 5)					
				Average energy J minimum					
				$t \leq 50$ mm		$50 < t \leq 70$ mm		$70 < t \leq 100$ mm	
				Longitudinal	Transverse	Longitudinal	Transverse	Longitudinal	Transverse
AH 27S DH 27S EH 27S FH 27S	265	400 – 530	22	27	20	34	24	41	27
AH 32 DH 32 EH 32 FH 32	315	440 – 590	22	31	22	38	26	46	31
AH 36 DH 36 EH 36 FH 36	355	490 – 620 (see Note 3)	21	34	24	41	27	50	34
AH 40 DH 40 EH 40 FH 40	390	510 – 650	20	39	26	46	31	55	37

Impact tests are to be made on the various grades at the following temperatures:

AH grades 0°C
 DH grades -20°C
 EH grades -40°C
 FH grades -60°C

NOTES

- The requirements for products thicker than those detailed in the table are subject to agreement, see 3.1.4.
- For full thickness tensile test specimens with a width of 25 mm and a gauge length of 200 mm, see Fig. 2.2.4 in Chapter 2, the minimum elongation is to be:

Thickness mm	≤5	>5 ≤10	>10 ≤15	>15 ≤20	>20 ≤25	>25 ≤30	>30 ≤40	>40 ≤50	>50
Elongation %	Strength levels 27S, 32	14	16	17	18	19	20	21	22
	Strength level 36	13	15	16	17	18	19	20	21
	Strength level 40	12	14	15	16	17	18	19	20

- Subject to special approval by LR, the minimum tensile strength may be reduced to 470 N/mm², for grades AH36, DH36, EH36 and FH36, in the TM condition when micro-alloying elements Nb, Ti or V are used singly and not in combination and provided the yield to tensile strength ratio does not exceed 0,89. For plates with a thickness ≤12 mm, the yield to tensile strength ratio is to be specially considered.
- Generally, tests need only be made in the longitudinal direction. For special applications, transverse test specimens may be required by the purchaser or LR. Transverse properties for plates and wide flats are to be guaranteed by the supplier.
- See 1.7.11
- See 3.6.8.

3.8.2 For steels which have been specially approved, the agreed identification mark, the specified minimum yield stress and, if applicable, the contents of alloying elements are additionally to be stated on the test certificate or shipping statement.

3.8.3 The steelmaker is to provide the Surveyor with a written declaration as detailed in 1.11.2.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 4

Section 4 Steels for boilers and pressure vessels

4.1 Scope

4.1.1 Provision is made in this Section for carbon, carbon-manganese and alloy steels intended for use in the construction of boilers and pressure vessels. In addition to specifying mechanical properties at ambient temperature for the purposes of acceptance testing, these requirements also give details of appropriate mechanical properties at elevated temperatures which may be used for design purposes.

4.1.2 Where it is proposed to use a carbon or carbon-manganese steel with a specified minimum tensile strength intermediate to those given in this Section, corresponding minimum values for the yield stress, elongation and mechanical properties at elevated temperatures may be obtained by interpolation.

4.1.3 Carbon and carbon-manganese steels with a specified minimum tensile strength of greater than 490 N/mm² but not exceeding 520 N/mm² may be accepted, provided that details of the proposed specification are submitted for approval.

4.1.4 Where it is proposed to use alloy steels other than as given in this Section, details of the specification are to be submitted for approval. In such cases the specified minimum tensile strength is not to exceed 600 N/mm².

4.1.5 Materials intended for use in the construction of the cargo tanks and process pressure vessels storage tanks for liquefied gases and for other low temperature applications are to comply with the requirements of Section 6 or 7, as appropriate.

4.2 Manufacture and chemical composition

4.2.1 The method of deoxidation and the chemical composition of ladle samples are to comply with the appropriate requirements of Table 3.4.1.

Table 3.4.1 Chemical composition and deoxidation practice

Grade of steel		Deoxidation	Chemical composition %										
Carbon and carbon-manganese steels			C max.	Si		Mn		P	S	Al	Residual elements		
360 AR	Any method except rimmed steel	0,18	0,50 max.	0,40 – 1,20		0,40 – 1,30		0,040 max.	–	–	Cr 0,25 max. Cu 0,30 max. Mo 0,10 max. Ni 0,30 max.		
410 AR		0,21		0,40 – 1,30									
460 AR		0,23		0,80 – 1,50									
360	Any method except rimmed steel	0,17	0,35 max.	0,40 – 1,20		0,50 – 1,30		0,035 max.	–	–			
410		0,20		0,50 – 1,30									
460		0,20 (see Note 1)	0,40 max.	0,80 – 1,40								–	
490	Killed			0,10 – 0,50		0,90 – 1,60		–					
360 FG	Killed fine grained	0,17 0,20	0,35 max.	0,40 – 1,20		0,50 – 1,30			0,035 max.	(see Note 2)	Total 0,70 max.		
410 FG				0,40 – 1,30									
460 FG		0,20 (see Note 1)	0,40 max.	0,80 – 1,50									
490 FG				0,10 – 0,50	0,90 – 1,60								
510 FG		0,22											
Alloy steel		C	Si	Mn		P S		Al	Cr	Mo	Residual elements		
13Cr Mo 45	Killed	0,10–0,18	0,15–0,35	0,4–0,8		0,035 max.		(see Note 3)	0,70–1,30	0,40–0,60	Cu 0,30 max.		
11Cr Mo 910		0,08–0,18	0,15–0,50						2,00–2,50	0,90–1,10	Ni 0,30 max.		
NOTES													
1. For thicknesses greater than 30 mm, carbon 0,22% max.													
2. Aluminium (acid soluble) 0,015% min. or Aluminium (total) 0,018% min.													
3. Aluminium (acid soluble or total) 0,020% max.													
Niobium, vanadium or other suitable grain refining elements may be used either in place of or in addition to aluminium.													

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 4

4.3 Heat treatment

4.3.1 All materials are to be supplied in a condition complying with the requirements given in Table 3.4.2 except that, when agreed, material intended for hot forming may be supplied in the as-rolled condition.

Table 3.4.2 Condition of supply

Grade of steel	Condition of supply
Carbon and carbon-manganese 360 AR to 460 AR	As-rolled Maximum thickness or diameter is 40 mm
Carbon and carbon-manganese 360 to 490	Normalised or normalised rolled
Carbon and carbon-manganese 360 FG to 510 FG	Normalised or normalised rolled
13Cr Mo 45	Normalised and tempered
11Cr Mo 910	Normalised and tempered

4.4 Mechanical tests

4.4.1 For plates, a tensile test specimen is to be taken from one end of each piece when the mass does not exceed 5 tonnes and the length does not exceed 15 m. When either of these limits is exceeded, tensile test specimens are to be taken from both ends of each piece. A piece is to be regarded as the rolled product from a single slab or from a single ingot if this is rolled directly into plates.

4.4.2 For strip, tensile test specimens are to be taken from both ends of each coil.

4.4.3 Sections and bars are to be presented for acceptance test in batches containing not more than 50 lengths, as supplied. The material in each batch is to be of the same section size, from the same cast and in the same condition of supply. One tensile test specimen is to be taken from material representative of each batch, except that additional tests are to be taken when the mass of a batch exceeds 10 tonnes.

4.4.4 Where plates are required for hot forming and it has been agreed that the heat treatment will be carried out by the fabricator, the tests at the steelworks are to be made on material which has been cut from the plates and given a normalising and tempering heat treatment in a manner simulating the treatment which will be applied to the plates.

4.4.5 If required by the Surveyors or by the fabricator, test material may be given a simulated stress relieving heat treatment prior to the preparation of the test specimens. This has to be stated on the order together with agreed details of the simulated heat treatment and the mechanical properties which can be accepted.

4.4.6 The results of all tensile tests are to comply with the appropriate requirements given in Tables 3.4.3 to 3.4.5.

Table 3.4.3 Mechanical properties for acceptance purposes: carbon and carbon-manganese steels – As-rolled

Grade of steel	Thickness mm	Yield stress N/mm ² minimum	Tensile strength N/mm ²	Elongation on 5,65 $\sqrt{S_0}$ % minimum
360 AR	≤ 40	190	360–480	24
410 AR		215	410–530	22
460 AR		240	460–580	21

Table 3.4.4 Mechanical properties for acceptance purposes: carbon and carbon-manganese steels – Normalised or normalised rolled

Grade of steel	Thickness mm (see Note)	Yield stress N/mm ² minimum	Tensile strength N/mm ²	Elongation on 5,65 $\sqrt{S_0}$ % minimum
360	>3 ≤16	205	360 – 480	26
	>16 ≤40	195		26
	>40 ≤63	185		25
410	>3 ≤16	235	410 – 530	24
	>16 ≤40	225		24
	>40 ≤63	215		23
460	>3 ≤16	285	460 – 580	22
	>16 ≤40	255		22
	>40 ≤63	245		21
490	>3 ≤16	305	490 – 610	21
	>16 ≤40	275		21
	>40 ≤63	265		20
360 FG	>3 ≤16	235	360 – 480	26
	>16 ≤40	215		26
	>40 ≤63	195		25
410 FG	>3 ≤16	265	410 – 530	24
	>16 ≤40	245		24
	>40 ≤63	235		23
460 FG	>3 ≤16	295	460 – 580	22
	>16 ≤40	285		22
	>40 ≤63	275		21
490 FG	>3 ≤16	315	490 – 610	21
	>16 ≤40	315		21
	>40 ≤63	305		21
510 FG	>3 ≤16	355	510 – 650	21
	>16 ≤40	345		
	>40 ≤63	335		

NOTE

For thicknesses greater than 63 mm, the minimum values for yield stress may be reduced by 1% for each 5 mm increment in thickness over 63 mm. The minimum elongation values may also be reduced one unit, for all thicknesses over 63 mm. For thicknesses over 100 mm, the above values are to be agreed.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 4

Table 3.4.5 Mechanical properties for acceptance purposes: alloy steels – Normalised and tempered

Grade of steel	Thickness mm (see Note)	Yield stress N/mm ² minimum	Tensile strength N/mm ²	Elongation on 5,65 $\sqrt{S_0}$ % minimum
13Cr Mo45	≤63	305	470–620	20
11Cr Mo910	≤16 >16 ≤63	275 265	480–630	18
NOTE For thicknesses greater than 63 mm, the minimum values for yield stress may be reduced by 1% for each 5 mm increment in thickness over 63 mm. The minimum elongation values may also be reduced one unit, e.g. for all thicknesses over 63 mm. For thicknesses over 100 mm, the above values are to be agreed.				

4.4.7 All test specimens are to be taken in the transverse direction unless otherwise agreed.

4.4.8 When material will be subject to strains in a through thickness direction, it is recommended that it should have specified through thickness properties in accordance with the requirements of Section 8.

4.5 Identification of materials

4.5.1 The particulars detailed in 1.10 are to be marked on all materials which have been accepted.

4.6 Certification of materials

4.6.1 Each test certificate or shipping statement is to give the information detailed in 1.11 together with general details of any heat treatment. The chemical composition is to include the content of all the elements detailed in Table 3.4.1.

4.7 Mechanical properties for design purposes

4.7.1 Nominal values for the minimum lower yield or 0,2 per cent proof stress at temperatures of 50°C and higher are given in Tables 3.4.6 to 3.4.8.

4.7.2 These values are intended for design purposes only, and verification is not required except for materials complying with National or proprietary specifications where the elevated temperature properties used for design purposes are higher than given in Tables 3.4.6 to 3.4.8.

Table 3.4.6 Mechanical properties for design purposes (see 4.7.1) : carbon and carbon-manganese steels – As-rolled

Grade of steel	Thickness mm	Design temperature °C (see Note)						
		50	100	150	200	250	300	350
		Nominal minimum lower yield or 0,2% proof stress N/mm ²						
360 AR	≤ 40	154	153	152	145	128	108	102
410 AR		186	183	181	174	155	134	127
460 AR		218	213	210	203	182	161	153
NOTE Maximum permissible design temperature is 350°C.								

4.7.3 In such cases, at least one tensile test at the proposed design or other agreed temperature is to be made on material from each cast. Where materials of more than one thickness are supplied from one cast, the thickest material is to be tested. The test specimens are to be prepared from material adjacent to that used for tests at ambient temperature. The axis of the test specimens is to be between mid and quarter thickness of the material and the test specimens are to be machined to dimensions in accordance with the requirements of Chapter 2. The test procedure is also to be as detailed in Chapter 2, and the results are to comply with the requirements of the National or proprietary specifications.

4.7.4 As an alternative to 4.7.3, a manufacturer may carry out an agreed comprehensive test program for a stated grade of steel to demonstrate that the specified minimum mechanical properties at elevated temperatures can be consistently obtained. This test program is to be carried out under supervision of the Surveyors, and the results submitted for assessment and approval. When a manufacturer is approved on this basis, tensile tests at elevated temperatures are not required for acceptance purposes but, at the discretion of the Surveyors, occasional check tests of this type may be requested.

4.7.5 Values for the estimated average stress to rupture in 100 000 hours are given in Table 3.4.9 and may be used for design purposes.

Section 5 Steels for machinery fabrications

5.1 General

5.1.1 Steel plates, sections or bars intended for use in the construction of major components of welded machinery structures, such as bedplates, crankcases, frames and entablatures, are to comply with one of the following alternatives:

- Any grade of normal strength structural steel as detailed in Section 2.
- Any grade of higher tensile structural steel as detailed in Section 3.
- Any grade of carbon-manganese boiler or pressure vessel steel as detailed in Section 4, except that for this application batch testing is acceptable. The size of a batch and the number of tensile tests are to be as detailed in Section 2.

5.1.2 The minus tolerances for plates and wide flats are to be in accordance with Table 3.5.1.

Section 6 Ferritic steels for low temperature service

6.1 Scope

6.1.1 This Section gives specific requirements for carbon-manganese and nickel alloy steels intended for use in the construction of cargo tanks, storage tanks and process pressure vessels for liquefied gases.

6.1.2 The requirements of this Section are also applicable for other types of pressure vessels where the use of steels with guaranteed impact properties at low temperatures is required.

6.1.3 Provision is made for plates and sections up to 40 mm thick.

6.1.4 Steels with alternative chemical compositions or mechanical properties or in a different supply condition may be given special consideration.

6.2 Manufacture and chemical composition

6.2.1 All steels are to be in the killed and fine grain treated condition.

6.2.2 The chemical compositions of carbon-manganese steels are to comply with the appropriate requirements for Grades AH, DH, EH and FH strength levels 27S, 32, 36 and 40, see Table 3.3.2. For the uses defined in 6.1.1 and 6.1.2, however, these grades are to be designated LT-AH, LT-DH, LT-EH and LT-FH respectively.

6.2.3 The chemical compositions of nickel alloy steels are to comply with the appropriate requirements of Table 3.6.1.

6.3 Heat treatment

6.3.1 All materials are to be supplied in a condition complying with the requirements given in Table 3.6.2.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 6

Table 3.6.1 Chemical compositions of nickel alloy steels

Grade of steel	C	Si	Mn	Ni	P	S	Residual elements	Aluminium
1 1/2 Ni	0,18 max.	0,10 – 0,35	0,30 – 1,50	1,30 – 1,70	0,025 max.	0,020 max.	Cr 0,25 max. Cu 0,35 max. Mo 0,08 max. Total 0,60 max.	Total 0,020% min. Acid soluble 0,015% min.
3 1/2 Ni	0,15 max.		0,30 – 0,90	3,20 – 3,80				
5Ni	0,12 max.			4,70 – 5,30				
9Ni	0,10 max.			8,50 – 10,0				

Table 3.6.2 Supply conditions

Grade	Plates	Sections and bars
LT – AH	N TM	Any
LT – DH		
LT – EH	Normalised (see Note) T.M.C.P.	N TM
LT – FH	Quenched and tempered	
1 ¹ / ₂ Ni	Normalised (see Note) Normalised and tempered Quenched and tempered	
3 ¹ / ₂ Ni		
5Ni		
9Ni	Double normalised and tempered Quenched and tempered	
NOTE Where the term ‘Normalised’ is used it does not include normalising rolling.		

6.4 Mechanical tests

6.4.1 For plates, a tensile test specimen is to be taken from one end of each piece when the mass does not exceed 5 tonnes and the length does not exceed 15 m. When either of these limits is exceeded, tensile test specimens are to be taken from both ends of each piece. A piece is to be regarded as the rolled product from a single slab or from a single ingot if this is rolled directly into plates.

6.4.2 For strips, tensile test specimens are to be taken from both ends of each coil.

6.4.3 Sections and bars are to be presented for acceptance test in batches containing not more than 50 lengths, as supplied. The material in each batch is to be of the same section size, from the same cast and in the same condition of supply. One tensile test specimen is to be taken from material representative of each batch, except that additional tests are to be taken when the mass of a batch exceeds 10 tonnes.

6.4.4 One set of three Charpy V-notch impact test specimens is to be taken for each tensile test specimen required.

6.4.5 For plates, these impact test specimens are to be cut with the principal axis perpendicular to the final direction of rolling. For sections, the impact test specimens are to be taken longitudinally.

6.4.6 The results of all tensile tests are to comply with the appropriate requirements given in Table 3.6.3. The ratio between the yield stress and the tensile strength is not to exceed 0,9 for normalised and TM steels and 0,94 for QT steels.

6.4.7 The average value for the three impact tests is to comply with the appropriate requirements given in Table 3.6.3. One individual value may be less than the required value provided that it is not less than 70 per cent of this average value. See Ch 2,1.4 for re-test procedures.

6.4.8 Where standard subsidiary impact specimens are necessary, see Ch 2,3.2.4.

6.5 Identification of materials

6.5.1 The particulars detailed in 1.10 are to be marked on all materials which have been accepted.

6.6 Certification of materials

6.6.1 Each test certificate or shipping statement is to give the information detailed in 1.11 together with general details of the heat treatment. The chemical composition is to include the content of all the elements detailed in Tables 3.3.2 or 3.6.1.

5Ni	390	540 – 740	21	–110	
9Ni	490	640 – 790	18	–196	

NOTES

- These requirements are applicable to products not exceeding 40 mm in thickness. The requirements for thicker products are subject to agreement.
- The minimum design temperatures at which plates of different thicknesses in the above grades may be used are given in Fig. 3.6.1 and Fig. 3.6.2. Consideration will be given to the use of thicknesses greater than those in the Tables or to the use of design temperatures below –165°C.
- Impact tests are not required on thicknesses less than 6 mm.

Minimum design temperatures for nickel grades

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 7

Section 7 Austenitic and duplex stainless steels

7.1 Scope

7.1.1 Provision is made in this Section for rolled products in austenitic and duplex (austenite plus ferrite) stainless steels intended for use in the construction of cargo tanks, storage tanks and process pressure vessels for chemicals and liquefied gases.

7.1.2 Austenitic stainless steels are suitable for applications where the lowest design temperature is not lower than -165°C .

7.1.3 Austenitic stainless steels are also suitable for service at elevated temperatures, and for such applications the proposed specification should contain, in addition to the requirements of 7.1.6, minimum values for 0,2 and 1,0 per cent proof stresses at the design temperature.

7.1.4 Duplex stainless steels are suitable for applications where the lowest design temperature is above 0°C . Any requirement to use duplex stainless steels below 0°C will be subject to special consideration.

7.1.5 Duplex stainless steels are also suitable for service at temperatures up to 300°C , and for such applications the proposed specification should include, in addition to the requirements of 7.1.6, a minimum value for 0,2 per cent proof stress at the design temperature.

7.1.6 A specification giving details of the chemical composition, heat treatment and mechanical properties, including, for the austenitic grades, both the 0,2 and 1,0 per cent proof stresses, is to be submitted for consideration and approval.

7.2 Chemical composition

7.2.1 The chemical composition of ladle samples is to comply with the requirements given in Table 3.7.1.

7.2.2 Consideration will be given to the use of steels whose compositions are outside the scope of Table 3.7.1.

7.3 Heat treatment

7.3.1 All materials are to be supplied in the solution treated condition.

7.4 Mechanical tests

7.4.1 Tensile test specimens are to be taken in accordance with the appropriate requirements of 4.4 and 6.4.1.

7.4.2 For the duplex grades, one set of three Charpy V-notch impact test specimens machined from the longitudinal direction for each tensile test is to be tested at -20°C . The average energy value of the three specimens is to be not less than 41 Joules.

7.4.3 Unless otherwise agreed, impact tests are not required from the austenitic grades of steel given in this Section.

Table 3.7.1 Chemical composition

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 7

7.4.4 Where standard subsidiary Charpy V-notch test specimens are necessary, see Ch 2,3.2.4.

7.4.5 The results of all tensile tests are to comply with the requirements of Table 3.7.2 or the approved specification.

7.5 Through thickness tests

7.5.1 Where material will be strained in a through thickness direction during welding or in service, through thickness tests are required on plates over 10 mm thick in all the grades of steels listed in Table 3.7.1, apart from Grades 304L, 304 LN, 321 and 347.

7.5.2 Testing is to conform with the requirements of Section 8, with the exception given in 7.5.3.

7.5.3 When the reduction in area is less than 35 per cent, metallographic or other evidence is required to show that no significant amount of any detrimental phase, such as sigma, is present.

7.6 Intergranular corrosion tests

7.6.1 For certain specific applications such as storage tanks for chemicals, it may be necessary to demonstrate that the material used is not susceptible to intergranular corrosion resulting from grain boundary precipitation of chromium-rich carbides.

7.6.2 When required, one test of this type is to be carried out for each tensile test. The material for the test is to be taken adjacent to that for the tensile test.

7.6.3 Unless otherwise agreed or required for a particular chemical cargo, the testing procedure is to be as given in 7.6.4, see Ch 2,8.

7.6.4 Wherever practical, exposed cut edges should be avoided. However, where any such edges are to remain after fabrication is completed it is to be shown by an appropriate test that the corrosion resistance is adequate for the cargoes expected to be encountered.

7.7 Clad plates

7.7.1 Carbon or carbon-manganese steel plates, clad on one or both surfaces with a suitable grade of austenitic or duplex stainless steel, may be used for the construction of cargo or storage tanks for chemicals.

7.7.2 The carbon or carbon-manganese steel base plates are to comply with the requirements of Section 4, and the austenitic cladding material generally with the requirements of this Section.

7.7.3 The process of manufacture is to be specially approved and may be either by roll cladding or by explosive bonding.

7.7.4 Where the use of clad materials is proposed, the material specification is to be submitted for consideration, together with details of the extent, and the acceptance standards for non-destructive examination.

7.8 Identification of materials

7.8.1 The particulars detailed in 1.10 are to be marked on all materials which have been accepted.

7.9 Certification of materials

7.9.1 Each test certificate or shipping statement is to give the information detailed in 1.11, together with general details of heat treatment and, where applicable, the results obtained from intercrystalline corrosion tests. The chemical composition is to include the content of all the elements detailed in Table 3.7.1.

Table 3.7.2 Mechanical properties for acceptance purposes

Section 8

Plates with specified through thickness properties

8.1 Scope

8.1.1 Provision is made in this Section for 'Z' grade plate and wide flat material with improved ductility in the through thickness or 'Z' direction, see Fig. 3.8.1. The use of this material is recommended for certain types of welded structures (see 1.2) in order to minimise the possibility of lamellar tearing either during fabrication or erection.

8.1.2 Through thickness properties are characterised by specified values for reduction of area in a through thickness tensile test.

8.1.3 Provision is made for two grades Z25 and Z35. For normal ship applications the Z25 grade is applicable, whilst the Z35 grade is for more severe applications.

8.1.4 This 'Z' grade material is to comply with the requirements of Sections 2, 3, 4, 5 and 6 as appropriate, and the additional requirements of this Section.

8.1.5 The test procedure detailed in this Section may also be used to demonstrate that no unacceptable amount of banding of any detrimental phase, such as sigma is present, see 7.5.

8.2 Manufacture

8.2.1 All plates and wide flats are to be manufactured at works which have been approved by LR for this quality of material.

8.2.2 It is recommended that the steel should be efficiently vacuum de-gassed. The sulphur content is not to exceed 0,008 per cent.

8.2.3 Consideration will be given to proposals for alternative methods of improving through thickness properties.

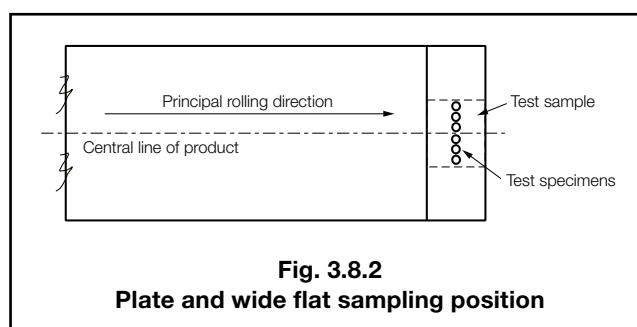

8.3 Test material

8.3.1 Unless otherwise agreed, through thickness tensile tests are only required for plate materials where the thickness exceeds 15 mm for carbon and alloy steels or 10 mm in the case of austenitic and duplex stainless steels.

8.3.2 For plates and wide flats, one test sample is to be taken close to the longitudinal centreline from one end of each rolled piece representing the batch, see Table 3.8.1 and Fig. 3.8.2. The test sample must be large enough to accommodate the preparation of 6 specimens. 3 test specimens are to be prepared while the rest of the sample remains for possible retest.

Table 3.8.1 Batch size dependent on product and sulphur content

Product	S > 0,005%	S ≤ 0,005%
Plates	Each piece (parent plate)	Maximum 50 t of products of the same cast, thickness and heat treatment
Wide flats of nominal thickness ≤ 25 mm	Maximum 10 t of products of the same cast, thickness and heat treatment	Maximum 50 t of products of the same cast, thickness and heat treatment
Wide flats of nominal thickness > 25 mm	Maximum 20 t of products of the same cast, thickness and heat treatment	Maximum 50 t of products of the same cast, thickness and heat treatment

8.3.3 The dimensions of the test specimens are to be in accordance with Ch 2,2.1.12.

8.3.4 Alternatively, test sampling may be carried out in accordance with an accepted National or International Standard.

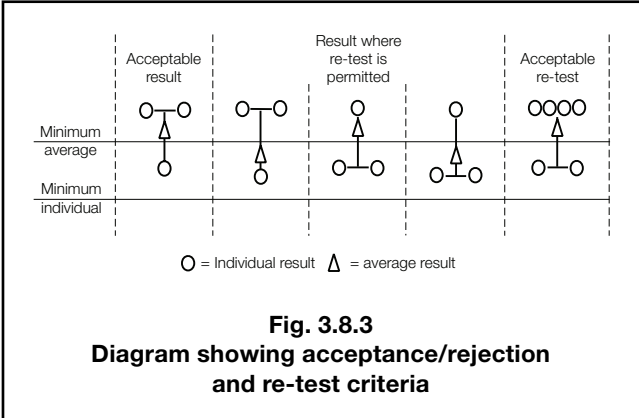

8.4 Mechanical tests

8.4.1 The three through thickness tensile test specimens are to be tested at ambient temperature and for acceptance are to give a minimum average reduction of area value of not less than that shown in Table 3.8.2. Only one individual value may be below the minimum average, but should not be less than the minimum individual value shown for the appropriate grade.

Table 3.8.2 Reduction of area acceptance values

Grade	Z25	Z35
Minimum average	25%	35%
Minimum individual	15%	25%

8.4.2 If the average value fails to comply with 8.4.1, three additional tests may be made on specimens from the same test sample. The results of these tests are to be added to those previously obtained to form a new average, which for acceptance is to be not less than 25 per cent for grade Z25 or 35 per cent for grade Z35. No individual results in the re-test shall be below 25 per cent for grade Z25 or 35 per cent for grade Z35, see Fig. 3.8.3.

8.4.3 Where batch testing is permitted, and failure after re-test occurs, the tested piece is to be rejected. Each remaining piece in the batch may be individually tested and accepted based on satisfactory results.

8.4.4 If the fracture of a test specimen occurs in the weld or in the heat affected zone the test is to be regarded as invalid and is to be repeated on a new test specimen.

8.5 Non-destructive examination

8.5.1 All 'Z' grade plates are to be ultrasonically tested in the final supply condition with a probe frequency of 3-5 MHz. The testing is to be performed in accordance with either EN 10160 Level S1/E1 or ASTM A 578 Level C.

8.6 Identification of materials

8.6.1 Products which comply with the requirements of this Section are to have the notation Z25 or Z35 added to the steel grade designation.

8.7 Certification

8.7.1 The following information is required to be included on the certificate in addition to the appropriate steel grade requirements:

- (a) Through thickness reduction in area (%), individual results and average.
- (b) Steel grade with Z25 or Z35 notation.

■ Section 9
 Bars for welded chain cables

9.1 Scope

9.1.1 Provision is made in this Section for rolled steel bars intended for the manufacture of three Grades (U1, U2 and U3) of stud link chain cable for the anchoring and mooring of ships and three Grades (R3, R3S and R4) of offshore mooring cable.

9.1.2 For the ship grades, U1, U2 and U3, approval will permit the supply of bars of the appropriate grades and size to any chain cable manufacturer.

9.1.3 For the offshore grades, R3, R3S and R4, approval is confined to bar to be supplied to a nominated chain manufacturer and will be given only after successful testing of a completed chain. Separate approvals are required if bar is to be supplied to more than one cable manufacturer.

9.1.4 For all grades, approval is normally given for diameters of bars no greater than those of the bars used in procedure tests.

9.2 Manufacture

9.2.1 All bar material is to be made from killed steel and, except for Grade U1 chain cables, is to be fine grained.

9.2.2 The bars are to be made to a specification approved by LR which should include the manufacturing procedure, deoxidation practice, heat treatment and mechanical properties.

9.3 Chemical composition

9.3.1 For Grades U1, U2 and U3 the chemical composition should be generally within the limits given in Table 3.9.1.

9.3.2 For Grades R3, R3S and R4 the chemical composition is to comply with an approved specification, see 9.2.2.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 9

Table 3.9.1 Chemical composition of killed steel bars

Grade	Chemical composition %												
	C max.	Si	Mn	P max.	S max.	Al	Nb max.	V max.	N max.	Cr max.	Cu max.	Ni max.	Mo max.
U1	0,20	0,15–0,35	0,40 min.	0,04	0,04	–	–	–	–	–	–	–	–
U2	0,24	0,15–0,55	1,60 max.	0,035	0,035	0,02 min. see Note 1	–	–	–	–	–	–	–
U3	0,33	0,15–0,35	1,90 max.	0,04	0,04	0,065 max. see Note 2	0,05 see Note 2	0,10 see Note 2	0,015	0,25	0,35	0,40	0,08

NOTES

1. Aluminium may be partly replaced by other grain refining elements.

2. To obtain fine grain steel, at least one of these grain refining elements must be present in sufficient amount.

9.3.3 For Grade R4 chain cable the steel should contain a minimum of 0,2 per cent molybdenum. The reported composition is to include the contents of antimony, arsenic, tin, copper, nitrogen, aluminium and titanium.

9.4 Heat treatment

9.4.1 Unless stipulated otherwise, the bars are to be supplied in the as-rolled condition, but the supplier is to be advised by the chain manufacturer of the heat treatment to be used for the completed chain in order that the mechanical test specimens may be tested in the condition of heat treatment used for the chain.

9.4.2 For Grades U1 and U2, the samples selected from each batch may be tested either in the as-rolled condition or after heat treatment in full cross-section and in a manner simulating the heat treatment applied to the finished cable.

9.4.3 For Grades U3, R3, R3S and R4 the sample is to be tested after heat treatment as detailed in 9.4.2.

9.5 Embrittlement tests

9.5.1 For Grades R3, R3S and R4 the bar manufacturer is to provide evidence that the material is not susceptible to strain ageing or to temper brittleness under the conditions of manufacture of the chain. The results of the relevant tests are to be reported to LR at the approval stage. Approval will be restricted to the specified steel composition and if later this is altered then re-approval will be required. Temper brittleness testing may be waived if the chain is to be quenched after tempering.

9.5.2 Each heat of grade R3S and R4 steel bars is to be tested for hydrogen embrittlement (see Ch 2,5.3). In the case of continuous casting, test samples representing both the beginning and the end of the charge are to be taken. In the case of ingot casting, test samples representing two different ingots are to be taken.

9.5.3 Each sample is to be heat treated in a manner simulating the heat treatment of the finished chain. From each sample two specimens are to be prepared from the mid-diameter of the bar and tested in accordance with Ch 2,5.3.

9.5.4 The ratio Z_1/Z_2 is to be greater than or equal to 0,85, where Z_1 is the reduction in area without baking and Z_2 the reduction in area after baking.

9.5.5 If the requirement is not met, the material is to be subjected to a hydrogen degassing treatment which is subject to approval by LR. Further tests are to be performed after degassing.

9.6 Mechanical tests

9.6.1 Bars of the same nominal diameter are to be presented for test in batches of 50 tonnes or fraction thereof from the same cast. A suitable length from one bar in each batch is to be selected for test purposes.

9.6.2 For all grades, one tensile test is to be taken from each sample length selected. Additionally, for Grades U3, R3, R3S and R4 material, one set of three Charpy V-notch impact test specimens is to be prepared. Impact tests are also required for Grade U2 when the chain is to be supplied in as-welded condition.

9.6.3 The results of all tensile and, where applicable, impact tests are to be in accordance with the appropriate requirements of Table 3.9.2.

9.7 Dimensional tolerances

9.7.1 The tolerances on diameter and ovality of the bar are to be in accordance with Table 3.9.3.

9.8 Non-destructive examination

9.8.1 For the R3, R3S and R4 grades all bars are to be inspected by a magnetic particle or eddy current method and are also to be subjected to ultrasonic examination.

9.8.2 The frequency of non-destructive testing may be reduced at the discretion of LR, provided statistical evidence is available that the required quality is achieved consistently.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Sections 9 & 10

Table 3.9.2 Mechanical properties

Grade	Yield stress N/mm ² minimum	Tensile strength N/mm ²	Elongation on 5,65 $\sqrt{S_0}$ % minimum	Reduction of area % minimum	Charpy V-notch impact tests		
					Test temperature °C	Average energy J minimum	Average energy flash weld J minimum
U1	—	370–490	25	—	—	—	—
U2	295	490–690	22	—	0 (see Note 1)	27	—
U3	410	690 minimum	17	40	0 –20 (see Note 2)	60 35	— —
R3	410 (see Note 3)	690 minimum (see Note 3)	17	50	0 –20 (see Note 2)	60 40	50 30
R3S	490 (see Note 3)	770 minimum (see Note 3)	15	50	0 –20 (see Note 2)	65 45	53 33
R4	580 (see Note 3)	860 minimum (see Note 3)	12	50	–20	50	36

NOTES

- Impact tests may be waived when the chain cable is to be supplied in one of the heat treated conditions given in Table 10.2.3.
- Testing may be carried out at either 0°C or –20°C, at the option of LR.
- The ratio of yield strength to tensile strength should not exceed 0,92.

Table 3.9.3 Dimensional tolerance of bar stock

Nominal diameter mm	Tolerance on diameter mm	Tolerance on roundness ($d_{\max} - d_{\min}$) mm
≤25	–0/+1,0	0,60
>26 ≤35	–0/+1,2	0,80
>36 ≤50	–0/+1,6	1,10
>51 ≤80	–0/+2,0	1,50
>81 ≤100	–0/+2,6	1,95
>101 ≤120	–0/+3,0	2,25
>121 ≤160	–0/+4,0	3,00

9.9 Identification

9.9.1 Each bar is to be identified in accordance with 1.10 and, in addition, is to be marked with the appropriate grade of chain cable.

9.10 Certification

9.10.1 Each consignment of bars is to be accompanied by a certificate in accordance with 1.11 but with the addition of the grade of chain cable.

Section 10 High strength quenched and tempered steels for welded structures

10.1 Scope

10.1.1 Provision is made in this Section for weldable high strength quenched and tempered steel plates and wide flats up to 70 mm thick. However, special consideration will be given to thicknesses up to 50 mm supplied in the TM rolled condition.

10.1.2 Plates and wide flats exceeding 70 mm in thickness as well as other product forms may also be supplied in accordance with the requirements of this Section provided that the prior agreement of LR is obtained.

10.1.3 The steels may be supplied in six strength levels with minimum yield stresses of 420, 460, 500, 550, 620 and 690 N/mm² respectively.

10.1.4 Each strength level is sub-divided into four grades AH, DH, EH and FH, differing essentially in the required levels of notch toughness.

10.1.5 For the designation to fully identify a steel and its properties, the appropriate grade letter should precede the strength level number, e.g. EH 42.

Rolled Steel Plates, Strip, Sections and Bars

Chapter 3

Section 10

10.1.6 Steels differing in strength level, mechanical properties and chemical composition from those detailed in this Section may be supplied, subject to special approval from LR. Such steels are to have the letter 'S' after the agreed identification mark.

10.2 Manufacture and chemical composition

10.2.1 The steels are to be fully killed and fine grain treated.

10.2.2 The chemical composition is to comply with the requirements of the approved manufacturing specification and the limits set in Table 3.10.1.

Table 3.10.1 Chemical composition

Grade	AH	DH	EH	FH
Carbon % max	0,21	0,20		0,18
Manganese % max	1,70	1,70		1,60
Silicon % max	0,55	0,55		0,55
Phosphorus % max	0,035	0,030		0,025
Sulphur % max	0,035	0,030		0,025
Nitrogen % max	0,020	0,020		0,020
Grain refining elements (see Note 1)				
Aluminium (acid soluble) % min (see Note 2)		0,015		
Niobium %		0,02—0,05		
Vanadium %		0,03—0,10		
Titanium % max		0,02		
Total (Nb + V + Ti) % max		0,12		
NOTES 1. The steel is to contain aluminium, niobium, vanadium or other suitable grain refining elements, either singly or in any combination. When used singly, the content is to be within the limits given in the Table. When used in combination, these limits are not applicable but the proportions of the grain refining elements are to be in accordance with the approved manufacturing specification. 2. The total aluminium content may be determined instead of the acid soluble content. In such cases the total aluminium content is not to be less than 0,020%. 3. Alloying elements and residual elements other than those listed in the Table (e.g. Ni, Cr, Cu, Mo and B) are to be included in the approved manufacturing specification.				

10.2.3 The cold cracking susceptibility, P_{cm} , may be used as an alternative to the carbon equivalent for evaluating weldability. It is to be calculated from the ladle analysis using the following formula:

$$P_{cm} = C + \frac{Si}{30} + \frac{Mn + Cr + Cu}{20} + \frac{Ni}{60} + \frac{Mo}{15} + \frac{V}{10} + 5B$$

The maximum allowable P_{cm} is to be agreed with LR and is to be included in the approved manufacturing specification.

10.3 Mechanical properties

10.3.1 At least one tensile test piece and one set of three Charpy V-notch impact tests specimens are to be taken from each piece as heat treated.

10.3.2 For continuously heat treated products, one tensile test piece and a set of three impact test specimens are to be taken from each plate as heat treated.

10.3.3 For plates and wide flats with widths exceeding 600 mm, the tensile and impact test specimens are to be taken with their axes transverse to the final direction of rolling. For other products, the impact test specimens are to be taken in the longitudinal direction but the tensile test specimens may be taken in either the longitudinal or transverse direction as agreed with LR.

10.3.4 The results of all tests are to comply with the appropriate requirements of Table 3.10.2.

10.3.5 Where standard subsidiary impact test specimens are necessary, see Ch 2,3.2.4.

10.4 Identification of materials

10.4.1 The particulars detailed in 1.10 are to be marked on each piece which has been accepted and, for ease of recognition, are to be encircled or otherwise marked with paint.

10.5 Certification of materials

10.5.1 At least two copies of each test certificate or shipping statement are to be provided. They are to give the information detailed in 1.11. The chemical composition is to include the contents of all the elements detailed in Table 3.10.1.

Rolled Steel Plates, Strip, Sections and Bars**Chapter 3**

Section 10

Table 3.10.2 Mechanical properties for acceptance purposes

Grade	Yield stress N/mm ² min. (see Note 1)	Tensile strength N/mm ²	Elongation on $5,65\sqrt{S_0}$ % minimum (see Note 2)		Charpy V-notch impact tests (see Note 4)		
			Transverse	Longitudinal	Test temperature °C	Average energy J minimum	
						Transverse	Longitudinal
AH 42 DH 42 EH 42 FH 42	420	530 – 680	18	20	0 -20 -40 -60	28	42
AH 46 DH 46 EH 46 FH 46	460	570 – 720	17	19	0 -20 -40 -60	31	46
AH 50 DH 50 EH 50 FH 50	500	610 – 770	16	18	0 -20 -40 -60	33	50
AH 55 DH 55 EH 55 FH 55	550	670 – 830	16	18	0 -20 -40 -60	37	55
AH 62 DH 62 EH 62 FH 62	620	720 – 890	15	17	0 -20 -40 -60	41	62
AH 69 DH 69 EH 69 FH 69	690	770 – 940	14	16	0 -20 -40 -60	46	69

NOTES

- Where a distinct yield stress indication is not obtainable during tensile testing the 0,2% proof stress is applicable.
- For full thickness tensile test specimens with a width of 25 mm and a gauge length of 200 mm (see Fig. 2.2.4 in Chapter 2) the minimum elongation is to be:

Thickness mm		≤10	>10 ≤15	>15 ≤20	>20 ≤25	>25 ≤40	>40 ≤50	>50 ≤70
Strength levels								
Elongation %	42	11	13	14	15	16	17	18
	46	11	12	13	14	15	16	17
	50 and 55	10	11	12	13	14	16	16
	62	9	11	12	12	13	14	15
	69	9	10	11	11	12	13	14

These values apply to transverse specimens. Where the use of longitudinal specimens has been agreed, the values are to be increased by 2%.

- The ratio of yield strength to tensile strength should not exceed 0,94.
- Impact tests are not required on thicknesses less than 6 mm.

Steel Castings

Chapter 4

Section 1

Section

- 1 **General requirements**
- 2 **Castings for ship and other structural applications**
- 3 **Castings for machinery construction**
- 4 **Castings for crankshafts**
- 5 **Castings for propellers**
- 6 **Castings for boilers, pressure vessels and piping systems**
- 7 **Ferritic steel castings for low temperature service**
- 8 **Stainless steel castings**
- 9 **Steel castings for container corner fittings**

■ Section 1 General requirements

1.1 Scope

1.1.1 This Section gives the general requirements for steel castings intended for use in the construction of ships, other marine structures, machinery, boilers, pressure vessels and piping systems.

1.1.2 Where required by the relevant Rules dealing with design and construction, castings are to be manufactured and tested in accordance with Chapters 1 and 2, together with the general requirements given in this Section and the appropriate specific requirements given in Sections 2 to 9.

1.1.3 As an alternative to 1.1.2, castings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

1.1.4 Where small castings are produced in large quantities, or where castings of the same type are produced in regular quantities, alternative survey procedures, in accordance with Ch 1,2.4 may be adopted.

1.2 Manufacture

1.2.1 Castings are to be made at foundries approved by LR. The steel used is to be manufactured by a process approved by Lloyd's Register (hereinafter referred to as 'LR').

1.2.2 All flame cutting, scarfing or arc-air gouging to remove surplus metal is to be undertaken in accordance with recognised good practice and is to be carried out before the final heat treatment. Preheating is to be employed where necessitated by the chemical composition and/or thickness of the casting. The affected areas are to be either machined or ground smooth for a depth of about 2 mm unless it has been shown that the material has not been damaged by the cutting process. Special examination will be required to find any cracking in way of the cut surfaces.

1.2.3 Where two or more castings are joined by welding to form a composite item, details of the proposed welding procedure are to be submitted for approval. Welding approval procedure tests will be required, see also the requirements of 1.9.

1.3 Quality of castings

1.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service. The surface finish is to be in accordance with good practice and any specific requirements of the approved specification.

1.3.2 The surfaces are not to be hammered, peened or treated in any way which may obscure defects.

1.3.3 The locations of all chaplets are to be noted and to be subject to close visual inspection (and when necessary ultrasonic examination) to ensure complete fusion.

1.4 Chemical composition

1.4.1 All castings are to be made from killed steel. The chemical composition of the ladle sample is to be within the limits given in the relevant Section of this Chapter. Where general overall limits are specified, the chemical composition is to be appropriate for the type of steel, dimensions and required mechanical properties of the castings.

1.4.2 Except where otherwise specified, suitable grain refining elements may be used at the discretion of the manufacturer. The content of such elements is to be reported in the ladle analysis.

1.5 Heat treatment

1.5.1 All castings are to be heat treated in accordance with the requirements given in the relevant Section of this Chapter.

1.5.2 Heat treatment is to be carried out in a properly constructed furnace which is efficiently maintained and has adequate means of temperature control and is fitted with pyrometers which measure and record the temperature of the furnace charge. The furnace dimensions are to be such as to allow the whole furnace charge to be uniformly heated to the necessary temperature. Sufficient thermocouples are to be connected to the furnace charge to show that its temperature is adequately uniform and the temperatures are to be recorded throughout the heat treatment. Alternative procedures are to be approved by LR, Materials and NDE department. Copies of these records are to be presented to the Surveyor together with a sketch showing the positions at which the temperature measurements were carried out. The records are to identify the furnace that was used and give details of the charge, the heat treatment temperature and time at temperature and the date. The Surveyor is to examine the charts and confirm the details on the certificate. In the case of very large components which require heat treatment, alternative methods will be specially considered.

1.5.3 If a casting is locally reheated, or any straightening operation is performed after the final heat treatment, a subsequent stress relieving heat treatment may be required in order to avoid the possibility of harmful residual stresses.

1.6 Test material and test specimens

1.6.1 Test material sufficient for the tests specified in Sections 2 to 9 and for possible re-test purposes is to be provided for each casting. The test samples are to be either integrally cast or gated to the casting and are to have a thickness of not less than 30 mm.

1.6.2 The test samples are not to be detached from the casting until the heat treatment specified in 1.5.1 has been completed and they have been properly identified.

1.6.3 As an alternative to 1.6.1 and 1.6.2, where a number of small castings of about the same size, each of which is under 1000 kg in mass, are made from one cast and heat treated in the same furnace charge, a batch testing procedure may be adopted, using separately cast test samples of suitable dimensions. The test samples are to be properly identified and heat treated together with the castings which they represent. At least one test sample is to be provided for each batch of castings.

1.6.4 The test specimens are to be prepared in accordance with the requirements of Chapter 2. Tensile test specimens are to have a cross-sectional area of not less than 150 mm².

1.6.5 Re-test procedures are to be in accordance with Ch 2, 1.4.

1.7 Visual and non-destructive examination

1.7.1 All castings are to be cleaned and adequately prepared for inspection. Suitable methods include pickling, caustic cleaning, wire brushing, local grinding, shot or sand blasting.

1.7.2 The surfaces are not to be hammered, peened or treated in any way which may obscure defects.

1.7.3 Unless otherwise agreed, the accuracy and verification of dimensions are the responsibility of the manufacturer.

1.7.4 All castings are to be presented to the Surveyor for visual examination. Where applicable, this is to include the examination of internal surfaces. Castings are to be subject to magnetic particle examination in accordance with 1.7.8, unless more specific requirements for non-destructive examination are included in subsequent Sections of this Chapter, other parts of the Rules or the agreed specification.

1.7.5 Where specified or required by the Rules non-destructive examination is to be carried out before acceptance. All tests are to be carried out by competent operators using reliable and efficiently maintained equipment. The testing procedures are to be acceptable to the Surveyor.

1.7.6 The manufacturer is to provide the Surveyor with a signed statement confirming that non-destructive examination has been carried out and that such inspection has not revealed any significant defects. Brief details of the testing procedure used are also to be included in this statement.

1.7.7 Where magnetic particle examination is specified or required, this is to be carried out using a suspension of magnetic particles in a suitable fluid. The dry powder method is not acceptable. Where current flow methods are used for magnetisation, particular care is to be taken to avoid damaging finished machined surfaces by contact burns from the prods.

1.7.8 Where required, magnetic particle or liquid penetrant testing is to be carried out by the manufacturer whenever appropriate and also when the castings are in the finished condition. The tests are to be made in the presence of the Surveyor unless otherwise specially agreed. The castings are to be examined in the following areas:

- (a) At all accessible fillets and changes of section.
- (b) At positions where surplus metal has been removed by flame cutting, scarfing or arc-air gouging.
- (c) In way of fabrication weld preparations.
- (d) At other positions agreed with the Surveyor to include areas which may be subjected to high stress in service.

Acceptance standards are to be to the satisfaction of the Surveyor.

1.7.9 Where required by subsequent Sections or by the agreed specification, ultrasonic examination is to be carried out by the manufacturer, but Surveyors may request to be present in order to verify that the examination is carried out in accordance with the agreed procedure. This examination is to be carried out in the following areas:

- (a) At positions which may be subjected to high stresses in service, as agreed with the Surveyor.
- (b) In way of fabrication weld preparations.
- (c) At positions where experience shows that significant internal defects may occur: these are to be agreed between the manufacturer and the Surveyor.
- (d) At positions where subsequent machining may expose filamentary shrinkage or other defects (e.g. bolt holes, bearing bores).

Steel Castings

Chapter 4

Section 1

1.7.10 Radiographic examination is to be carried out by the manufacturer in areas generally as indicated for ultrasonic examination in 1.7.9. All radiographs are to be submitted to the Surveyor for examination and acceptance. The radiographic technique and acceptance standards are to be to the satisfaction of the Surveyor and in accordance with any requirements of the approved specification.

1.7.11 In the event of any casting proving to be defective during subsequent machining or testing it is to be rejected notwithstanding any previous certification.

1.8 Pressure testing

1.8.1 Where required by the relevant Rules, castings are to be pressure tested in the final machined condition before final acceptance. These tests are to be carried out in the presence of the Surveyors and are to be to their satisfaction.

1.9 Rectification of defective castings

1.9.1 When unacceptable defects are found in a casting, these are to be removed by machining or chipping. Flame-scarfing or arc-air gouging may also be used provided that preheating is employed when necessary and that the surfaces of the resulting excavation are subsequently ground smooth. Complete elimination of the defective material is to be proven by adequate non-destructive testing. Shallow grooves or excavations resulting from the removal of defects may, at the discretion of the Surveyor, be accepted provided that they will cause no appreciable reduction in the strength of the castings and that they are suitably blended by grinding. Complete elimination of the defective material is to be verified by magnetic particle or liquid penetrant testing. Small surface irregularities sealed by welding are to be treated as weld repairs.

1.9.2 Where flame scarfing or arc-air gouging is used, the requirements detailed in 1.2.2 are to apply.

1.9.3 Grinding wheels for use on austenitic stainless steels are to be of an iron-free type and shall have been used only on stainless steels.

1.9.4 All proposals to repair a defective casting by welding are to be submitted to the Surveyor before this work is commenced. The Surveyor is to satisfy himself that the number, position and size of the defects are such that the casting can be effectively repaired.

1.9.5 A statement and/or sketch detailing the extent and position of all weld repairs is to be prepared by the manufacturer. Copies of these sketches are to be submitted to LR, and copies are to be attached to the certificates for the castings.

1.9.6 Where it has been agreed that the casting can be repaired, the work is to be carried out by an approved welder and in accordance with an approved welding procedure which includes the features referred to in 1.9.6 to 1.9.13.

1.9.7 Where the weld repair of defects is required, a grain refining heat treatment is to be given to the whole casting prior to carrying out weld repairs unless agreed otherwise with the Surveyor. Grain refining heat treatment requires heating above the upper critical temperature.

1.9.8 Any excavations are to be of suitable shape to allow good access for welding and, after final preparation for welding, are to be re-examined by suitable non-destructive testing methods to ensure that all defective material has been eliminated.

1.9.9 All castings in alloy steels other than austenitic and duplex stainless steels are to be suitably preheated prior to welding. Castings in carbon-manganese steels may also be required to be preheated, depending on their chemical composition, the dimensions, configuration and positions of the weld repairs.

1.9.10 Welding is to be done under cover, in positions free from draughts and adverse weather conditions, by qualified welders with adequate supervision. As far as possible, all welding is to be carried out in the downhand (flat) position.

1.9.11 The welding consumables used are to be of an appropriate composition, giving a weld deposit with mechanical properties similar and in no way inferior to those of the parent castings. The use of low hydrogen type welding consumables is preferred. Welding procedure tests are to be carried out by the manufacturer to demonstrate that satisfactory mechanical properties can be obtained after heat treatment as detailed in 1.9.12, and the results of these tests are to be presented to the Surveyor.

1.9.12 After welding is completed, the castings are to be given the heat treatment specified in Sections 2 to 9, or a stress relieving heat treatment at a temperature of not less than 550°C. The type of heat treatment required will be dependent on the chemical composition of the casting and the dimensions, positions and nature of the repairs.

1.9.13 Special consideration may be given to a local stress relieving heat treatment where both the repaired area is small and machining of the casting has reached an advanced stage but prior agreement is to be obtained from LR (Materials and NDE Department). The welding procedure is to be such that residual stresses are minimised.

1.9.14 On completion of heat treatment, the weld repairs and adjacent material are to be ground smooth and examined by magnetic particle, or liquid penetrant testing, ultrasonic or radiographic examination. The Surveyor is to attend at these inspections, to witness the results of magnetic particle or liquid penetrant examination and to examine any radiographs. Satisfactory results are to be obtained from all forms of non-destructive testing used.

1.9.15 Where no weld repairs have to be made on a casting, the manufacturer is to provide the Surveyor with a statement that this is the case.

1.9.16 The foundry is to maintain full records detailing the weld procedure, heat treatment and the extent and location of repairs made to each casting. These records are to be available for review by the Surveyor, and copies of individual records are to be supplied to the Surveyor on request.

1.9.17 For rectification of defective steel castings for crankshafts, see 4.7.

1.10 Identification of castings

1.10.1 The manufacturer is to adopt a system of identification, which will enable all finished castings to be traced to the original cast, and the Surveyor is to be given full facilities to trace the castings when required.

1.10.2 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked by the manufacturer with the following particulars:

- Identification number, cast number or other marking which will enable the full history of the casting to be traced.
- LR or Lloyd's Register and the abbreviated name of LR's local office.
- Personal stamp of Surveyor responsible for inspection.
- Test pressure, where applicable.
- Date of final inspection.

1.10.3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

1.11 Certification

1.11.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which has been accepted:

- Purchaser's name and order number.
- Description of castings and steel quality.
- Identification number.
- Steel making process, cast number, chemical analysis of ladle samples and, in the case of the Special grade (see Section 2), the chemical analysis of the product or test bar.
- General details of heat treatment including the temperature and time at temperature.
- Results of mechanical tests.
- Test pressure, where applicable.

1.11.2 Where applicable, the manufacturer is to provide a signed statement regarding non-destructive testing as required by 1.7.6 together with a statement and/or sketch detailing the extent and position of all weld repairs made to each casting as required by 1.9.5 or the statement detailed in 1.9.15.

Section 2 Castings for ship and other structural applications

2.1 Scope

2.1.1 The requirements for carbon-manganese steel castings, intended for ship and other structural applications where the design and acceptance tests are related to mechanical properties at ambient temperature, are given in this Section.

2.1.2 Provision is made for two quality grades, Normal and Special.

2.1.3 Where it is proposed to use carbon-manganese steels of higher specified minimum tensile strength than required by 2.4.3, or alloy steels, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval.

2.2 Chemical composition

2.2.1 The chemical composition of ladle samples is to comply with Table 4.2.1.

Table 4.2.1 Chemical composition

Quality grade	Normal	Special (see Note 3)
Carbon	0,23% max.	0,23% max.
Silicon	0,60% max.	0,60% max.
Manganese	0,70–1,60%	0,70–1,60%
Sulphur	0,040% max.	0,035% max.
Phosphorus	0,040% max.	0,035% max.
Aluminium – (acid soluble)	—	0,015–0,080% (see Notes 1 and 2)
Residual elements:		
Copper	0,30% max.	0,30% max.
Chromium	0,30% max.	0,30% max.
Nickel	0,40% max.	0,40% max.
Molybdenum	0,15% max.	0,15% max.
Total	0,80% max.	0,80% max.
NOTES 1. The total aluminium content may be determined instead of the acid soluble content, in which case the total aluminium content is to be 0,020–0,10%. 2. Grain refining elements other than aluminium may be used subject to special agreement with LR. 3. For the Special grade, the nitrogen content is to be determined.		

2.2.2 For the Special grade, the product of the aluminium and nitrogen contents is to comply with the following formula:

$$(\% \text{ Al}_{\text{acid sol}} \times \% \text{ N}) 10^5 \leq 60$$

2.2.3 For the Special grade, a check chemical analysis on the product or a test bar is mandatory. The check analysis on the product or test bar is to comply with the requirements of Table 4.2.1.

2.3 Heat treatment

2.3.1 Castings are to be supplied:

- (a) fully annealed; or
- (b) normalised; or
- (c) normalised and tempered at a temperature of not less than 550°C; or
- (d) quenched and tempered at a temperature of not less than 550°C.

2.3.2 For larger castings where a coarse of microstructure may be present in heavier thickness, a double austenising heat treatment may be required to ensure adequate grain refinement. A coarse microstructure will be indicated by an increased attenuation of approximately 30 dB/m at 2 MHz during ultrasonic examination.

2.3.3 Following weld repair and or the attachment of handling brackets, all castings are to be subject to post weld heat treatment at a temperature of not less than 550°C before delivery.

2.4 Mechanical tests

2.4.1 At least one tensile test is to be made on material representing each casting or batch of castings.

2.4.2 Where the casting is of complex design, or where the finished mass exceeds 10 tonnes, two test samples are to be provided. Where large castings are made from two or more casts which are not mixed in a ladle prior to pouring, two or more test samples are required corresponding to the number of casts involved. These are to be integrally cast at locations as widely separated as possible.

2.4.3 The results of these tests are to comply with the following requirements:

Yield stress	200 N/mm ² min.
Tensile strength	400 N/mm ² min.
Elongation on $5,65\sqrt{S_0}$	25% min.
Reduction of area	40% min.

2.4.4 A set of three Charpy V-notch impact test specimens is to be provided with each casting in the Special grade. These may be taken from a small extension of the thickest part of the casting or from a block cast integrally with the casting and having dimensions representative of the largest section thickness of the casting. These are to be tested in accordance with Chapter 2 and are to have an average energy of not less than 27J at 0°C.

2.5 Non-destructive examination

2.5.1 Castings used in ship construction for the sternframe, rudder and propeller shaft supports are to be examined by ultrasonic and magnetic particle methods in accordance with 1.7. The type and extent of non-destructive examination of castings for other structural applications are to be specially agreed by the Surveyor.

Section 3 Castings for machinery construction

3.1 Scope

3.1.1 This Section gives the material requirements for carbon-manganese steel castings intended for use in machinery construction and which are not within the scope of Sections 4 to 7.

3.1.2 Where it is proposed to use steels of higher carbon content than is indicated in 3.2.1, or alloy steels, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval.

3.1.3 The manufacture or repair of cast steel connecting rods is not permitted, except where the manufacturing and quality control procedures have been approved by LR. For approval purposes, tests are to be carried out at the place of manufacture using the proposed process to demonstrate that the castings are sound. Tests are to be carried out to confirm that the appropriate mechanical properties are attained within the casting, including areas where weld repairs have been performed. Any changes to manufacturing, repair and quality control procedures are to be submitted to LR for approval, see *also* Ch 1,2.2.

3.2 Chemical composition

3.2.1 The chemical composition of ladle samples is to comply with the following limits, except as specified in 3.2.2:

Carbon	0,40% max.
Silicon	0,60% max.
Manganese	0,50–1,60%
Sulphur	0,040% max.
Phosphorus	0,040% max.
Residual elements:	
Copper	0,30% max.
Chromium	0,30% max.
Nickel	0,40% max.
Molybdenum	0,15% max.
	Total 0,80% max.

3.2.2 Castings which are intended for parts of a welded fabrication are to be of weldable quality with a carbon content generally not exceeding 0,23 per cent.

3.2.3 Proposals to use steels with higher carbon content, or alloy steels, for welded construction will be subject to special consideration.

3.3 Heat treatment

3.3.1 Castings are to be supplied:

- (a) fully annealed; or
- (b) normalised; or
- (c) normalised and tempered at a temperature of not less than 550°C; or
- (d) quenched and tempered at a temperature of not less than 550°C.

3.3.2 Engine bedplate castings, turbine castings and any other castings where dimensional stability and freedom from internal stresses are important, are to be given a stress relief heat treatment. This is to be at a temperature not lower than 550°C, followed by furnace cooling to 300°C or lower. Alternatively, full annealing may be used provided that the castings are furnace cooled to 300°C or lower.

3.4 Mechanical tests

3.4.1 At least one tensile test is to be made on material representing each casting or batch of castings.

3.4.2 Where the casting is of complex design, or where the finished mass exceeds 10 tonnes, two test samples are to be provided. Where large castings are made from two or more casts which are not mixed in a ladle prior to pouring, two or more test samples are required corresponding to the number of casts involved. The test samples are to be integrally cast at locations as widely separated as possible.

3.4.3 Table 4.3.1 gives the minimum requirements for yield stress, elongation and reduction of area corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. Intermediate levels of minimum tensile strength may be specified, in which case minimum values for yield stress, elongation and reduction of area may be obtained by interpolation.

Table 4.3.1 Mechanical properties for acceptance purposes: carbon and carbon-manganese steel castings for machinery construction

Tensile strength N/mm ²	Yield stress N/mm ² minimum	Elongation on $5,65\sqrt{S_0}$ % minimum	Reduction of area % minimum
400–550	200	25	40
440–590	220	22	30
480–630	240	20	27
520–670	260	18	25
560–710	300	15	20
600–750	320	13	20

3.4.4 Castings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 4.3.1.

3.4.5 The results of all tensile tests are to comply with the requirements of Table 4.3.1 appropriate to the specified minimum tensile strength.

3.4.6 For alloy steel castings and carbon-manganese steel castings containing more than 0,40 per cent carbon, the results of all mechanical tests are to comply with an approved specification.

3.4.7 When a casting, or a batch of castings, has failed to meet the mechanical test requirements, it may be re-heat treated and re-submitted for acceptance tests but this may not be carried out more than twice, see Ch 1,4.6.

3.5 Non-destructive examination

3.5.1 All piston crowns and cylinder covers are to be examined by ultrasonic testing. In addition, where these castings are intended for engines having a bore size larger than 400 mm, they are to be examined by magnetic particle or dye penetrant testing in accordance with 1.7.

3.5.2 Engine bedplate castings are to be examined by ultrasonic and magnetic particle or dye penetrant testing in accordance with 1.7.

3.5.3 Turbine castings are to be examined by magnetic particle or dye penetrant testing in accordance with 1.7. In addition, an ultrasonic or radiographic examination is to be made in way of fabrication weld preparations.

3.5.4 Other castings are to be examined by non-destructive methods where specified.

Section 4 Castings for crankshafts

4.1 Scope

4.1.1 This Section gives the requirements for carbon and carbon-manganese steel castings for semi-built crankshafts.

4.1.2 Where it is proposed to use steels of higher carbon content than is indicated in 4.3.1, or alloy steels, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval. For alloy steels, the specified minimum tensile strength is not to exceed 700 N/mm².

4.2 Manufacture

4.2.1 The method of producing combined web and pin castings is to be approved. For this purpose, tests to demonstrate the soundness of the casting and the properties at important locations may be required.

Steel Castings

Chapter 4

Section 4

4.3 Chemical composition

4.3.1 The chemical composition of ladle samples is to comply with the following limits:

Carbon	0,40% max. (but see 4.7.5(c))
Silicon	0,60% max.
Manganese	0,50–1,60%
Sulphur	0,040% max.
Phosphorus	0,040% max.
Residual elements:	
Copper	0,30% max.
Chromium	0,30% max.
Nickel	0,40% max.
Molybdenum	0,15% max.
	Total 0,80% max.

4.4 Heat treatment

4.4.1 Castings are to be supplied either:

- fully annealed and cooled in the furnace to a temperature of 300°C or lower; or
- normalised and tempered at a temperature of not less than 550°C, and cooled in the furnace to a temperature of 300°C or lower.

4.5 Mechanical tests

4.5.1 Proposals for the number of tests and the location of test material on the casting are to be submitted by the manufacturer.

4.5.2 Not less than one tensile test and three impact tests are to be made on material representing each casting. The impact tests are to be carried out at ambient temperature.

4.5.3 Table 4.4.1 gives the minimum requirements for yield stress and elongation corresponding to different strength levels, and it is not intended that these should necessarily be regarded as specific grades. The strength levels have been given in multiples of 40 N/mm² to facilitate interpolation for intermediate values of specified minimum tensile strength.

Table 4.4.1 Mechanical properties for acceptance purposes: carbon-manganese steel castings for crankshafts

Tensile strength N/mm ²	Yield stress N/mm ² minimum	Elongation on $5,65\sqrt{S_0}$ % minimum	Reduction of area % minimum	Charpy V-notch impact tests average energy J minimum (see Note)
400–550	200	28	45	32
440–590	220	26	45	28
480–630	240	24	40	25
520–670	260	22	40	20
550–700	275	20	35	18
NOTE Impact tests are to be made at ambient temperature.				

4.5.4 Castings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 4.4.1.

4.5.5 The results of all tests are to comply with the requirements of Table 4.4.1 appropriate to the specified minimum tensile strength. For the impact tests, one individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. See Ch 1,4.6 for re-test procedures.

4.6 Non-destructive examination

4.6.1 Magnetic particle examination is to be carried out over all surfaces in accordance with Fig. 4.4.1.

4.6.2 Each casting is to be examined by ultrasonic testing, and the extent of examination and defect acceptance criteria, using the DGS (Distance Gain Size) technique, are to be as shown in Fig. 4.4.2. Alternative ultrasonic procedures may be submitted for approval.

4.7 Rectification of defective castings

4.7.1 The requirements of 1.9 apply, except where amended by this Section.

4.7.2 Where castings have shallow surface defects, consideration is first to be given to removing such defects by grinding and blending or by machining the surface where there is excess metal on the Rule dimension.

4.7.3 Welded repairs are to be undertaken only when the repairs are considered to be necessary and are approved by the Surveyor.

4.7.4 Subject to prior agreement and submission of the detailed welding procedure for approval by LR, weld repairs may be carried out prior to the final austenitising heat treatment.

4.7.5 Approval for weld repairs will not be given in the following circumstances:

- For the rectification of repetitive defects caused by improper foundry technique or practice.
- For the building up by welding of surfaces or large shallow depressions.
- Where the carbon content of the steel exceeds 0,30 per cent.
- Where the carbon equivalent of the steel, given by
$$C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15}$$
 exceeds 0,65 per cent.

Fig. 4.4.1 Magnetic particle inspection acceptance levels

4.7.6 Provided that the Surveyors are satisfied that repairs by welding are justified, they may also authorise repairs to the surfaces of crankwebs, following the final austenitising heat treatment, within the following limits:

- In general, the volume of the largest groove which is to be welded is not to exceed $3,2t \text{ cm}^3$, where t is the web axial thickness, in cm. The total volume of all grooves which are to be welded is not to exceed $9,6t \text{ cm}^3$ per crankweb.
- The welds do not extend within the cross-hatched zones marked on Fig. 4.4.3 for semi-built crank throws.
- Larger repairs on balance weights may be permitted at the discretion of the Surveyor, provided that such repairs are wholly contained within the balance weight and do not affect the strength of the crankweb.

4.7.7 Subsequent to the final austenitising heat treatment, weld repairs may also be authorised in the surface of the bore for the journal (or pin) within the following limits:

- In general, the welds are to be not less than 125 mm apart.
- The welds are not to be located within circumferential bands of $\frac{t}{5}$ from the edges of the bores, nor at any position within the inner 120° arc of the bores, as cross-hatched on Fig. 4.4.3.
- The volume of the largest weld is to be not more than $1,1t \text{ cm}^3$, where t is the web axial thickness at the bore, in cm, and not more than three welds are to be made in any one bore surface.

4.7.8 After all defective material has been removed from a region, and this has been proven in the presence of the Surveyor by magnetic particle inspection or other suitable method, the excavation is to be suitably shaped to allow good access for welding.

4.7.9 At the discretion of the Surveyor, the size of a groove may be increased beyond the limiting sizes given in 4.7.6 or 4.7.7, if the removal of further metal will facilitate welding.

4.7.10 Weld repairs are to be carried out by approved welders using approved procedures. The welds are to be made by an electric arc process using low hydrogen type consumables which will produce a deposited metal that is not inferior in properties to the parent metal.

4.7.11 All castings are to be given a preliminary refining heat treatment prior to the commencement of weld repairs. Before welding, the material is to be preheated in accordance with the qualified procedure. Where possible, preheating is to be carried out in a furnace. The preheat temperature is to be maintained until welding is completed, and preferably until the casting is charged to the furnace for post-weld heat treatment.

4.7.12 Where weld repairs are carried out after the final austenitising heat treatments, a post-weld stress relieving heat treatment is to be applied at a temperature of not less than 600°C, see also 1.5.2.

4.7.13 Welds are to be dressed smooth by grinding, and proven by magnetic particle and, where appropriate, ultrasonic inspection. The surfaces of the welds and adjacent parent steel are to be free from harmful defects.

Section 5 Castings for propellers

5.1 Scope

5.1.1 This Section gives the requirements for steel castings for one-piece propellers and separately cast blades and hubs for fixed pitch and controllable pitch propellers (CPP). These include contra-rotating propellers, azipods and azimuth thrusters. The requirements for copper alloy propellers, blades and hubs are given in Ch 9,1.

5.1.2 These castings are to be manufactured and tested in accordance with the appropriate requirements of Chapters 1 and 2 and Ch 4,1 as well as the requirements of this Section.

5.1.3 Full details of the manufacturer's specification are to be submitted for approval. These should include the chemical composition, heat treatment, mechanical properties, micro-structure and repair procedures.

5.1.4 Special requirements are given for castings which are intended for ice service in Table 4.5.2.

5.2 Chemical composition

5.2.1 The chemical composition of ladle samples is to comply with the approved specification, see 5.1.3.

5.2.2 Typical cast steel propeller alloys are given in Table 4.5.1.

5.3 Heat treatment

5.3.1 Martensitic stainless steel castings are to be austenitised, quenched and tempered in accordance with the approved specification, see 5.1.3.

5.3.2 Austenitic stainless steel castings are to be solution treated in accordance with the approved specification, see 5.1.3.

5.4 Mechanical tests

5.4.1 The test material is to be cast integral with the boss of propeller castings, or with the flange of separately cast propeller blades. Alternatively, the test material may be attached on blades in an area between 0,5 and 0,6R, where R is the radius of the propeller.

5.4.2 The test material is not to be removed from the casting until final heat treatment has been carried out. Removal is to be by non-thermal procedures.

5.4.3 At least one tensile test and for the martensitic stainless steel grades one set of three Charpy V-notch impact tests are to be made on material representing each casting. The results are to comply with the requirements of Table 4.5.2 or the approved specification.

Table 4.5.1 Typical chemical composition for steel propeller castings

Alloy type	C Max. (%)	Mn Max. (%)	Cr (%)	Mo Max. (%) (see Note)	Ni (%)
Martensitic (12Cr 1Ni)	0,15	2,0	11,5–17,0	0,5	Max. 2,0
Martensitic (13Cr 4Ni)	0,06	2,0	11,5–17,0	1,0	3,5–5,0
Martensitic (16Cr 5Ni)	0,06	2,0	15,0–17,5	1,5	3,5–6,0
Austenitic (19Cr 11Ni)	0,12	1,6	16,0–21,0	4,0	8,0–13,0
NOTE Minimum values are to be in accordance with the agreed specification or recognised National or International Standards.					

Table 4.5.2 Typical mechanical properties for steel propeller castings

Alloy type	Yield stress or, 0,2% proof stress minimum, N/mm ²	Tensile strength minimum N/mm ²	Elongation on 5,65√S ₀ % minimum	Reduction of area % minimum	Charpy V-notch impact tests J minimum (see Notes 1 and 2)
Martensitic (12Cr 1Ni)	440	590	15	30	20
Martensitic (13Cr 4Ni)	550	750	15	35	30
Martensitic (16Cr 5Ni)	540	760	15	35	30
Austenitic (19Cr 11Ni)	180 (see Note 3)	440	30	40	—
NOTES 1. When a general service notation Ice Class 1AS, 1A, 1B or 1C is required, the tests are to be made at –10°C. 2. For general service or where the notation Ice Class 1D is required, the tests are to be made at 0°C. 3. R _{p1,0} value is 205 N/mm ² .					

5.4.4 As an alternative to 5.4.3, where a number of small propeller castings of about the same size, and less than 1 m in diameter, are made from one cast and heat treated in the same furnace charge, a batch testing procedure may be adopted using separately cast test samples of suitable dimensions. At least one set of mechanical tests is to be provided for each multiple of five castings in the batch.

5.5 Non-destructive examination

5.5.1 On completion of machining and grinding, the whole surface of each casting is to be examined in accordance with Ch 9, 1.8.

5.5.2 When appropriate, magnetic particle inspection may be used in lieu of liquid penetrant testing.

5.6 Rectification of defective castings

5.6.1 The rectification of defective castings is to be undertaken in accordance with 1.9 and the following paragraphs.

5.6.2 Removal of defective material is to be by mechanical means, e.g. by grinding, chipping or milling. The resultant grooves are to be blended into the surrounding surface so as to avoid any sharp contours.

5.6.3 Grinding in severity zone A may be carried out to an extent that maintains the blade thickness. Repair by welding is generally not permitted in zone A and will only be allowed after special consideration.

5.6.4 Defects in severity zone B that are not deeper than $t/40$ mm (t is the minimum local thickness according to the Rules) or 2 mm, whichever is the greater, are to be removed by grinding. Those defects that are deeper may be repaired by welding subject to prior approval of the Surveyor.

5.6.5 Repair welding is generally permitted in severity zone C.

5.6.6 Welds having an area of less than 5 cm² are to be avoided. The maximum surface area of repairs is to be in accordance with Table 9.1.4 in Chapter 9.

5.6.7 Welding is to be in accordance with the approved specification, see 5.1.3.

5.6.8 After weld repair, the propeller or blade is to be heat treated in such fashion as will minimise the residual stresses. For martensitic stainless steels, this will involve full heat treatment as specified in the approved specification.

5.6.9 LR reserves the right to restrict the amount of repair work accepted from a manufacturer when it appears that repetitive defects are the result of improper foundry techniques or practices.

5.7 Identification

5.7.1 Castings are to be clearly marked by the manufacturer in accordance with the requirements of Chapter 1. The following details are to be shown on all castings which have been accepted:

- (a) Identification mark which will enable the full history of the item to be traced.
- (b) Type of steel, this should include or allow identification of the chromium and nickel contents.
- (c) LR or Lloyd's Register and the abbreviated name of Lloyd's Register's local office.
- (d) Personal stamp of Surveyor responsible for the final inspection.
- (e) LR certificate number.
- (f) Skew angle, if in excess of 25°.
- (g) Ice class symbol, where applicable.
- (h) Date of final inspection.

5.8 Certification

5.8.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting:

- (a) Purchaser's name and order number.
- (b) Description of casting with drawing number.
- (c) Type of steel, including designation and chemical composition.
- (d) Diameter, number of blades, pitch, direction of turning.
- (e) Cast identification number.
- (f) Details of heat treatment, where applicable.
- (g) Skew angle, if in excess of 25°.
- (h) Final mass.
- (i) Results of mechanical tests.
- (j) Vessel identification, where known.

Section 6 Castings for boilers, pressure vessels and piping systems

6.1 Scope

6.1.1 This Section gives the requirements for carbon-manganese and alloy steel castings for boilers, pressure vessels and piping systems for use at temperatures not lower than 0°C.

6.1.2 Where it is proposed to use alloy steels other than as given in this Section, details of the specification are to be submitted for approval. In such cases, the specified minimum tensile strength is not to exceed 600 N/mm².

6.1.3 Castings which comply with these requirements are acceptable for liquefied gas piping systems where the design temperature is not lower than 0°C. Where the design temperature is lower than 0°C, and for other applications where guaranteed impact properties at low temperatures are required, the castings are to comply with the requirements of Section 7 or 8.

Steel Castings

Chapter 4

Section 6

6.2 Chemical composition

6.2.1 The chemical composition of ladle samples is to comply with the limits specified in Table 4.6.1.

6.3 Heat treatment

6.3.1 Castings are to be supplied:

- (a) fully annealed; or
- (b) normalised; or
- (c) normalised and tempered; or
- (d) quenched and tempered.

6.4 Mechanical tests

6.4.1 A tensile test is to be made on material representing each casting, unless a batch testing procedure has been agreed, see 1.6.

6.4.2 The tensile test is to be carried out at ambient temperature, and unless agreed otherwise with the Surveyor, the results are to comply with the requirements of Table 4.6.2.

6.4.3 Where it is proposed to use a carbon-manganese steel with a specified minimum tensile strength intermediate to those given in this Section, corresponding minimum values for the yield stress, elongation and reduction of area may be obtained by interpolation.

6.4.4 Carbon-manganese steels with a specified minimum tensile strength of greater than 490 N/mm², but not exceeding 520 N/mm², may be accepted provided that details of the proposed specification are submitted for approval.

Table 4.6.1 Chemical composition of steel castings for boilers, pressure vessels and piping systems

Type of steel	Chemical composition %										
	C max.	Si max.	Mn	S max.	P max.	Residual elements					
Carbon-manganese	0,25	0,60	0,50-1,20	0,040	0,040	Cr 0,30 max. Mo 0,15 max. Cu 0,30 max. Ni 0,40 max. Total 0,80 max.					
1/2 Mo	0,20	0,60	0,50–1,00	0,040	0,040	Cr	Mo	V	Residual elements		
						Cr	Cu	Ni			
1 Cr 1/2 Mo	0,20	0,60	0,50-0,80	0,040	0,040	—	0,45-0,65	—	0,30 max.	0,30 max.	0,40 max.

1/2Cr1/2Mo1/4V	264	—	244	—	230	—	214	—	194	—	144

6.5 Non-destructive examination

6.5.1 The non-destructive examination of castings is to be carried out in accordance with the appropriate requirements of 1.7.6 to 1.7.10 and additionally as agreed between the manufacturer, purchaser and Surveyor.

6.6 Mechanical properties for design purposes

6.6.1 Nominal values for the minimum lower yield or 0,2 per cent proof stress at temperatures of 100°C and higher are given in Table 4.6.3. These values are intended for design purposes only, and verification is not required except for materials complying with National or proprietary specifications where the elevated temperature properties used for design purposes are higher than those given in Table 4.6.3.

6.6.2 In such cases, at least one tensile test at the proposed design or other agreed temperature is to be made on each casting or each batch of castings. The test specimen is to be taken from material adjacent to that used for tests at ambient temperature, and the test procedure is to be in accordance with the requirements of Chapter 2. The results of all tests are to comply with the requirements of the National or proprietary specification.

6.6.3 Values for the estimated average stress to rupture in 100 000 hours are given in Table 4.6.4 and may be used for design purposes.

Table 4.6.4 Mechanical properties for design purposes (see 6.6.3): estimated average stresses to rupture in 100,000 hours (N/mm²)

Section 7

Ferritic steel castings for low temperature service

7.1 Scope

7.1.1 This Section gives the requirements for castings in carbon-manganese and nickel alloy steels intended for use in liquefied gas piping systems where the design temperature is lower than 0°C, and for other applications where guaranteed impact properties at low temperatures are required.

7.1.2 Where it is proposed to use alternative steels, particulars of the specified chemical composition, mechanical properties and heat treatment are to be submitted for approval.

Table 4.7.1 Chemical composition of ferritic steel castings for low temperature service

Type of steel	Chemical composition %						Residual elements max.
	C max.	Si max.	Mn	S max.	P max.	Ni	
Carbon-manganese	0,25	0,60	0,70-1,60	0,030	0,030	0,80 max.	Cr 0,25 Cu 0,30 Mo 0,15 V 0,03 Total 0,60
2 ¹ / ₄ Ni	0,25	0,60	0,50-0,80	0,025	0,030	2,00-3,00	
3 ¹ / ₂ Ni	0,15	0,60	0,50-0,80	0,020	0,025	3,00-4,00	

Table 4.7.2 Mechanical properties for acceptance purposes: ferritic steel castings for low temperature service

Type of steel	Grade	Yield stress N/mm ² minimum	Tensile strength N/mm ²	Elongation on 5,65 $\sqrt{S_0}$ % minimum	Reduction or area % minimum	Charpy V-notch impact test	
						Test temperature °C	Average energy J minimum
Carbon-manganese	400	200	400-550	25	40	-60 (see Note)	27
	430	215	430-580	23	35		
	460	230	460-610	22	30		
2 ¹ / ₄ Ni	490	275	490-640	20	35	-70	34
3 ¹ / ₂ Ni	490	275	490-640	20	35	-95	34
NOTE The test temperature for carbon-manganese steels may be 5°C below the design temperature if the latter is above -55°C, with a maximum test temperature of -20°C.							

7.2 Chemical composition

7.2.1 The chemical composition of ladle samples is to comply with the limits specified in Table 4.7.1. Carbon-manganese steels are to be made by fine grain practice.

7.3 Heat treatment

7.3.1 Castings are to be supplied:

- (a) normalised; or
- (b) normalised and tempered; or
- (c) quenched and tempered.

7.4 Mechanical tests

7.4.1 One tensile test and one set of three Charpy V-notch impact test specimens are to be prepared from material representing each casting or batch of castings.

7.4.2 The tensile test is to be carried out at ambient temperature, and the results are to comply with the appropriate requirements given in Table 4.7.2.

7.4.3 The average value for impact test specimens is to comply with the appropriate requirements given in Table 4.7.2. One individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. See Ch 2,1.4 for re-test procedure.

7.5 Non-destructive examination

7.5.1 The non-destructive examination of castings is to be carried out in accordance with the appropriate requirements of 1.7.6 to 1.7.10 and additionally agreed between the manufacturer, purchaser and Surveyor.

Section 8 Stainless steel castings

8.1 Scope

8.1.1 This Section gives the requirements for castings in austenitic and duplex stainless steels for machinery, marine structures, piping systems in ships for liquefied gases, and in bulk chemical tankers.

8.1.2 Austenitic stainless steels castings are suitable for applications where the lowest design temperature is not lower than -165°C.

8.1.3 Duplex stainless steels castings are suitable for applications where the lowest design temperature is above 0°C. Any requirement to use duplex stainless steels castings below 0°C will be subject to special consideration.

Steel Castings

Chapter 4

Section 8

8.1.4 Where it is proposed to use alternative steels, particulars of the specified chemical composition, mechanical properties and heat treatment are to be submitted for approval.

8.2 Chemical composition

8.2.1 The chemical composition of ladle samples is to comply with the requirements given in Table 4.8.1.

8.3 Heat treatment

8.3.1 Austenitic stainless steel castings are to be solution treated at a temperature of not less than 1000°C and cooled rapidly in water.

8.3.2 Duplex stainless steels castings are to be solution treated at a temperature of not less than 1100°C and cooled rapidly in water.

8.4 Mechanical tests

8.4.1 One tensile test specimen is to be prepared from material representing each casting or batch of castings. In addition, where the castings are intended for liquefied gas applications, where the design temperature is lower than -55°C, one set of three Charpy V-notch impact test specimens is to be prepared.

8.4.2 The tensile test is to be carried out at ambient temperature, and the results are to comply with the requirements given in Table 4.8.2.

8.4.3 The average value for impact test specimens is to comply with the appropriate requirements given in Table 4.8.2. One individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. See Ch 2, 1.4 for re-test procedures.

8.5 Intergranular corrosion tests

8.5.1 Where corrosive conditions are anticipated in service, intergranular corrosion tests are required on castings in grades 304, 316, 317 and all duplex stainless steels. Such tests may not be required for grades 304L, 316L and 347.

8.5.2 Where an intergranular corrosion test is specified, it is to be carried out in accordance with the procedure given in Ch 2, 8.1.

8.6 Non-destructive examination

8.6.1 The non-destructive examination of castings is to be carried out in accordance with the appropriate requirements of 1.7.6 to 1.7.10 and additionally agreed between the manufacturer, purchaser and Surveyor.

Table 4.8.1 Chemical composition of stainless steel castings

Type of steel	Chemical composition %								
	C	Si	Mn	S	P	Cr	Mo	Ni	Others
Austenitic									
304L	0,03	0,20-1,5	0,50-2,0	0,040	17,0-21,0	—	8,0–12,0	—	
304	0,08					—	8,0–12,0	—	
316L	0,03					2,0–3,0	9,0–13,0	—	
316	0,08					2,0–3,0	9,0–13,0	—	
317	0,08					3,0–4,0	9,0–12,0	—	
347 (see Note 1)	0,06					—	9,0–12,0	Nb ≥ 8 x C ≤ 0,90	
Duplex									
UNS S 31803	0,03	1,00	2,00	0,025	0,035	21,0–23,0	2,5–3,5	4,5–6,5	N 0,08–0,20
NOTES									
1. When guaranteed impact values at low temperature are not required, the maximum carbon content may be 0,08% and the maximum niobium may be 1,00%.									
2. Where a single value is shown (and not a range of values), the value is to be taken as maximum.									

Table 4.8.2 Mechanical properties for acceptance purposes: stainless steel castings

■

Section 9

Steel castings for container corner fittings

9.1 General

9.1.1 This Section gives the requirements for cast steel corner fittings used in the fabrication of freight and tank containers. The fittings are also to comply with the requirements of the latest edition of International Standard ISO 1161.

9.1.2 The castings are to be made in foundries approved by LR. These foundries are also to be specially approved for the manufacture of container corner castings. In order to comply with these requirements, the manufacturer is required to verify that the casting soundness, mechanical properties, weldability and dimensional tolerances required by this Section and the manufacturing specification are met.

9.1.3 Castings may be released on the basis of an LR survey or, alternatively, the manufacturer may be approved by means of a Quality Assurance Scheme as detailed in Ch 1,2.

9.2 Chemical composition

9.2.1 Chemical analysis is to be carried out on each cast.

9.2.2 The chemical composition of the ladle samples is to comply with the limits given in Table 4.9.1.

9.2.3 The carbon equivalent:

$$C_{eq} = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15} \text{ (%)}$$

must not exceed 0,45 per cent.

Table 4.9.1 Chemical composition of steel castings for container corner fittings

Chemical composition %										
C max.	Mn	Si max.	P max.	S max.	Cr max.	Ni max.	Cu max.	Mo max.	Al acid soluble min. (See Notes)	Cr + Ni + Cu + Mo max.
0,20	0,90 to 1,50	0,50	0,035	0,035	0,25	0,30	0,20	0,08	0,015	0,70
NOTES 1. The total aluminium content may be determined instead of the acid soluble content. In such cases, the total aluminium content is to be not less than 0,02%. 2. Aluminium may be replaced partly or totally by other grain refining elements as stated in the approved specification.										

Steel Castings

Chapter 4

Section 9

9.3 Heat treatment

9.3.1 Castings are to be supplied either:

- (a) normalised; or
- (b) water or oil quenched and tempered at a temperature of not less than 550°C.

9.4 Mechanical tests

9.4.1 At least one tensile test is to be made on each batch of castings, using separately cast test bars which are to be from the same cast and heat treatment lot as the castings they represent.

9.4.2 The results of the tensile tests are to comply with the following:

Yield stress	220 N/mm ² min.
Tensile strength	430–600 N/mm ²
Elongation on $\sqrt{S_0}$	25% min.
Reduction of area	40% min.

9.4.3 Impact tests are not required on all casts but may be required on a random basis at the discretion of the Surveyor.

9.4.4 When required, the impact test specimens are to be tested in accordance with Ch 1,4.5 and Ch 2,3.2. In general, tests are to be made at a temperature of –20°C and the minimum average energy obtained is to be 27J.

9.5 Non-destructive examination

9.5.1 Ultrasonic or radiographic testing is to be carried out, in accordance with 1.7.9 or 1.7.10 respectively, on at least one casting from each cast or from every 400 castings, whichever is the lesser.

9.6 Repair of defects

9.6.1 Minor defects may be removed by grinding provided that the allowable minus tolerance is not exceeded.

9.6.2 Defects which exceed the allowable minus tolerance may be removed by grinding or chipping followed by welding, provided the weld depth does not exceed 40 per cent of the wall thickness and that the following requirements are met:

- (a) welding is not to be carried out in the as-cast condition; the grain structure has to be refined by heat treatment,
- (b) the casting is to be preheated to 80–100°C,
- (c) welding is to be performed only by qualified welders in accordance with a qualified welding procedure,
- (d) all welded castings are to be post-weld heat treated at a temperature not less than 550°C,
- (e) the welded areas are to be ground or machined flush with the adjacent surface and inspected by magnetic particle or dye penetrant examination as appropriate.

9.7 Identification

9.7.1 Each casting is to be clearly marked by the manufacturer with at least the following:

- (a) manufacturer's name or trade mark,
- (b) cast number or identification number which will enable the full history of the casting to be traced.

9.7.2 Where the casting has been inspected and found acceptable it is to be marked with the Surveyor's personal stamp.

9.7.3 The markings may be stamped or cast on the inner surface of the casting.

9.8 Certification

9.8.1 For each consignment the manufacturer is to provide the Surveyor with a certificate or delivery note containing at least the following:

- (a) Purchaser's name and order number.
- (b) Grade of steel.
- (c) Drawing and/or specification number.
- (d) Cast number and chemical composition.
- (e) Details of the heat treatment.
- (f) Number and weight of the castings.
- (g) Results of inspections and mechanical tests.

Steel Forgings

Chapter 5

Section 1

Section

- 1 **General requirements**
- 2 **Forgings for ship and other structural applications**
- 3 **Forgings for shafting and machinery**
- 4 **Forgings for crankshafts**
- 5 **Forgings for gearing**
- 6 **Forgings for turbines**
- 7 **Forgings for boilers, pressure vessels and piping systems**
- 8 **Ferritic steel forgings for low temperature service**
- 9 **Austenitic stainless steel forgings**

■ Section 1 General requirements

1.1 Scope

1.1.1 This Section gives the general requirements for steel forgings intended for use in the construction of ships, other marine structures, machinery, boilers, pressure vessels and piping systems. These requirements are also applicable to rolled slabs and billets used as a substitute for forgings and to rolled bars used for the manufacture (by machining operations only) of shafts, bolts, studs and other components of similar shape.

1.1.2 When required by the relevant Rules dealing with design and construction, forgings are to be manufactured and tested in accordance with Chapters 1 and 2, together with the general requirements given in this Section and the appropriate specific requirements given in Sections 2 to 9.

1.1.3 As an alternative to 1.1.2, steel forgings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

1.1.4 Normalised forgings with mass up to 1000 kg each and quenched and tempered forgings with mass up to 500 kg each may be batch tested. A batch is to consist of forgings of similar shape and dimensions, made from the same heat of steel, heat treated in the same furnace charge and with a total mass not exceeding 6 tonnes for normalised forgings and 3 tonnes for quenched and tempered forgings, respectively.

1.1.5 A batch testing procedure may also be used for hot rolled bars, see 3.4.3.

1.1.6 Where small forgings are produced in large quantities, or where forgings of the same type are produced in regular quantities, alternative survey procedures in accordance with Ch 1,2.4 may be adopted.

1.2 Manufacture

1.2.1 Forgings are to be made at works which have been approved by Lloyd's Register (hereinafter referred to as LR). The steel used is to be manufactured in accordance with the requirements of Ch 3,1.3.

1.2.2 When forgings are made directly from ingots, or from blooms or billets forged from ingots, the ingots are to be cast in chill moulds with the larger cross-section uppermost and with efficient feeder heads.

1.2.3 Adequate top and bottom discards are to be made to ensure freedom from piping and harmful segregations in the finished forgings.

1.2.4 The forgings are to be gradually and uniformly hot worked and are to be formed as closely as possible to the finished shape and size. The plastic deformation is to be such as to ensure soundness, uniformity of structure and satisfactory mechanical properties after heat treatment.

1.2.5 For certain components, such as crankshafts, where grain flow is required in the most favourable direction having regard to the mode of stressing in service, the proposed method of manufacture may require special approval by LR. In such cases, tests may be required to demonstrate that a satisfactory structure and grain flow are obtained.

1.2.6 The reduction ratio (reduction of area expressed as a ratio) is to be calculated with reference to the average cross-sectional area of the ingot or continuously cast material, where appropriate. Where an ingot is initially upset, this reference area may be taken as the average cross-sectional area after this operation.

1.2.7 For components forged directly from ingots or from forged blooms or billets, and in which the fibre deformation is mainly longitudinal, the reduction ratio is not to be less than 3:1.

1.2.8 For forgings made from rolled billets, or where fibre deformation has taken place in more than one direction, the reduction ratio is not to be less than 4:1.

1.2.9 Where rolled bars are used as a substitute for forgings and the requirements of 1.2.2 are not complied with, the reduction ratio is to be not less than 6:1.

1.2.10 Where the length of any section of a shaft forging is less than its diameter (e.g. a collar), the reduction ratio is to be not less than half that given in 1.2.7, 1.2.8 or 1.2.9 respectively.

1.2.11 Disc type forgings, such as gear wheels, are to be made by upsetting, and the thickness of any part of the disc is to be not more than one-half of the length of the billet from which it was formed, provided that this billet has received an initial forging reduction of not less than 1,5:1. Where the piece used has been cut directly from an ingot, or where the billet has received an initial reduction of less than 1,5:1, the thickness of any part of the disc is to be not more than one-third of the length of the original piece.

1.2.12 Rings and other types of hollow forgings are to be made from pieces cut from ingots or billets and which have been suitably punched, bored or trepanned prior to expanding or hollow forging. Alternatively, pieces from hollow cast ingots may be used. The wall thickness of the forging is to be not more than one-half of the thickness of the prepared hollow piece from which it was formed. Where this is not practicable, the forging procedure is to be such as to ensure that adequate work is given to the piece prior to punching, etc. This may be either longitudinal or upset working of not less than 2:1.

1.2.13 The shaping of forgings or rolled slabs and billets by flame cutting, scarfing or arc-air gouging is to be undertaken in accordance with recognised good practice and, unless otherwise approved, is to be carried out before the final heat treatment. Preheating is to be employed where necessitated by the composition and/or thickness of the steel. For certain components, subsequent machining of all flame cut surfaces may be required, see 4.2.4.

1.2.14 Where two or more forgings are joined by welding to form a composite component, details of the proposed welding procedure are to be submitted for approval. Welding approval procedure tests may be required.

1.3 Quality

1.3.1 All forgings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

1.4 Chemical composition

1.4.1 All forgings are to be made from killed steels, and the chemical composition of ladle samples is to comply with the requirements detailed in subsequent Sections in this Chapter. Where general overall limits are specified, the chemical composition selected is to be appropriate for the type of steel, dimensions and required mechanical properties of the forgings being manufactured.

1.4.2 Except where otherwise specified, suitable grain refining elements such as aluminium, niobium or vanadium may be used at the discretion of the manufacturer. The content of such elements is to be reported in the ladle analysis.

1.4.3 For alloy steel forgings, the chemical composition of ladle samples is to generally comply with the following overall limits and the requirements of the approved specifications:

Carbon	0,45% max.
Silicon	0,45% max.
Manganese	0,30% min.
Sulphur	0,035% max.
Phosphorus	0,035% max.
Copper	0,30% max

And at least one of the following elements is to comply with the minimum content:

Chromium	0,40% min
Molybdenum	0,15% min
Nickel	0,40% min

The contents of all alloying elements and significant impurities detailed in the specification are to be reported.

1.4.4 Details of the proposed chemical composition for carbon-manganese steel forgings intended for welding and alloy steel forgings are to be submitted for approval.

1.5 Heat treatment

1.5.1 At an appropriate stage of manufacture, after completion of all hot working operations, forgings are to be suitably heat treated to refine the grain structure and to obtain the required mechanical properties. Acceptable heat treatment procedures are to be such as to avoid the formation of hair-line cracks and are detailed in Sections 2 to 9.

1.5.2 Heat treatment is to be carried out in properly constructed furnaces which are efficiently maintained and have adequate means for control and recording of temperature. The furnace dimensions are to be such as to allow the whole furnace charge to be uniformly heated to the necessary temperature. In the case of very large forgings, alternative methods of heat treatment will be specially considered. Sufficient thermocouples are to be connected to the furnace charge to measure and record that its temperature is adequately uniform. Alternative procedures are to be approved by LR, Materials and NDE Department.

1.5.3 Where forgings are to be quenched and tempered and cannot be hot worked close to size and shape, they are to be suitably rough machined or flame cut prior to being subjected to this treatment.

1.5.4 If for any reason a forging is subsequently heated for further hot working, the forging is to be reheat treated.

1.5.5 If any straightening operation is performed after the final heat treatment, consideration should be given to a subsequent stress relieving heat treatment in order to avoid the possibility of harmful residual stresses.

1.5.6 Where it is intended to surface harden forgings, full details of the proposed procedure and specification are to be submitted for approval. For the purposes of this approval, the manufacturer will be required to demonstrate by tests that the proposed procedure gives a uniform surface layer of the required hardness and depth and that it does not impair the soundness and properties of the steel.

1.5.7 Where induction hardening or nitriding is to be carried out after machining, forgings are to be heat treated at an appropriate stage to a condition suitable for this subsequent surface hardening.

1.5.8 Where carburising is to be carried out after machining, forgings are to be heat treated at an appropriate stage (generally either by full annealing or by normalising and tempering) to a condition suitable for subsequent machining and carburising.

1.5.9 The forge is to maintain records of heat treatment identifying the furnace used, furnace charge, thermocouple location, date, temperature and time at temperature. The records are to be presented to the Surveyor on request.

1.6 Test material

1.6.1 Test material, sufficient for the required tests and for possible re-test purposes, is to be provided with a cross-sectional area of not less than that part of the forging which it represents. This test material is to be integral with each forging, except in the case of small forgings which are batch tested, see 1.6.4.

1.6.2 Where a forging is subsequently divided into a number of components, all of which are heat treated together in the same furnace charge, for test purposes this may be regarded as one forging and the number of tests required is to be related to the total length and mass of the original multiple forging, see 2.4.2.

1.6.3 Except for components which are to be carburised, test material is not to be cut from a forging until the heat treatment detailed in Sections 2 to 9 has been completed. The testing procedure for components which are to be carburised is to be in accordance with the details given in Section 5.

1.6.4 Where a number of small forgings of about the same size are made from one cast and heat treated in the same furnace charge, batch testing procedures (see 1.1.4) may be adopted using one of the forgings for test purposes, or alternatively using separately forged test samples. These test samples are to have a forging reduction similar to that used for the forgings which they represent. They are to be properly identified and heat treated together with the forgings.

1.7 Mechanical tests

1.7.1 Specimens for mechanical tests are to be prepared as required by Sections 2 to 9.

1.7.2 Test specimens are normally to be cut with their axes mainly parallel (longitudinal test) or mainly tangential (tangential test) to the principal axial direction of each product.

1.7.3 Unless otherwise agreed, the longitudinal axis of the test specimens is to be positioned as follows:

- (a) for thickness or diameter ≤ 50 mm, the axis is to be at the mid-thickness or the centre of the cross-section;

- (b) for thickness or diameter > 50 mm, the axis is to be at one quarter thickness (mid-radius) or 30 mm, whichever is less, below any heat treated surface;

Test pieces shall be taken in such a way that no part of the gauge length is machined from material closer than 12,5 mm to any heat treated surface. For impact testing, this requirement is to apply to the complete test piece.

1.7.4 Tensile test specimens are to be machined to the dimensions detailed in Chapter 2. Where this is precluded by the dimensions of the forging, the test specimen is to be of the largest practicable cross-sectional area.

1.7.5 Impact test specimens are to be prepared in accordance with the requirements of Chapter 2.

1.7.6 The procedures used for the tensile and impact tests are to be in accordance with the requirements of Chapter 2.

1.7.7 Hardness tests, preferably of the Brinell type, are to be carried out when specified in subsequent Sections in this Chapter.

1.8 Visual and non-destructive examination

1.8.1 Before acceptance, all forgings are to be presented to the Surveyor for visual examination. Where applicable, this is to include the examination of internal surfaces and bores.

1.8.2 Forgings are to be examined in the condition for final delivery. Surfaces are to be clean and free from dirt, grease, paint, etc. Black forgings are to be suitably descaled by either shotblasting or flame descaling methods.

1.8.3 Visual examination may indicate areas which are to be examined by magnetic particle, dye penetrant or ultrasonic examination in addition to that indicated in 1.8.4.

1.8.4 When specified in subsequent Sections in this Chapter, or by an approved procedure for welding composite components, see 1.2.14, appropriate non-destructive examination is also to be carried out before acceptance. All such tests are to be carried out by competent operators using reliable and efficiently maintained equipment. The testing procedures used are to be agreed with the Surveyors.

1.8.5 Magnetic particle and liquid penetrant testing is to be carried out when the forgings are in the finished machined condition, see also Ch 1.2.3.5. Where current flow methods are used for magnetisation, particular care is to be taken to avoid damaging machined surfaces by contact burns from the prods. Unless otherwise agreed, these tests are to be carried out in the presence of the Surveyor.

1.8.6 Acceptance standards for defects found by magnetic particle or liquid penetrant testing are to be to the satisfaction of the Surveyors and in accordance with any specific requirements of the approved plan.

1.8.7 Where required, ultrasonic examination is to be carried out after the forgings have been machined to a condition suitable for this type of examination and after the final heat treatment. Both radial and axial scanning are to be carried out where appropriate for the shape and the dimensions of the forgings being examined. Unless otherwise agreed, this examination is to be carried out by the manufacturer, although Surveyors may request to be present in order to verify that the examination is being carried out in accordance with the agreed procedure.

1.8.8 If the forging is supplied in the black condition for machining at a separate works, the manufacturer is to ensure that a suitable ultrasonic examination is carried out to verify the internal quality of the forging.

1.8.9 In the circumstance detailed in either 1.8.7 or 1.8.8, the manufacturer is to provide the Surveyor with a signed statement confirming that ultrasonic examination has been carried out and that such inspection has not revealed any significant internal defects. Brief details of the testing procedure used are also to be included in this statement.

1.8.10 Unless otherwise agreed, the accuracy and verification of dimensions are the responsibility of the manufacturer.

1.8.11 In the event of any forging proving defective during subsequent machining or testing, it is to be rejected notwithstanding any previous certification.

1.8.12 When required by the conditions of approval for surface hardened forgings (see 1.5.6) additional test samples are to be processed at the same time as the forgings which they represent. These test samples are subsequently to be sectioned in order to determine the hardness, shape and depth of the locally hardened zone and which are to comply with the requirements of the approved specification.

1.9 Rectification of defects

1.9.1 Small surface imperfections may be removed by grinding or by chipping and grinding. Complete elimination of these imperfections is to be proved by magnetic particle or dye penetrant examination. At the discretion of the Surveyor, the resulting shallow grooves or depressions can be accepted, provided that they are blended by grinding.

1.9.2 Repairs by welding are not generally permitted, but special consideration will be given to such repairs where they are of a minor nature and in areas of low working stresses. In such cases, full details of the proposed repair and subsequent inspection procedures are to be submitted for the approval of the Surveyors prior to the commencement of the proposed rectification. A statement and/or sketch detailing the extent and location of all repairs, together with details of the post-weld heat treatment and non-destructive examination are to be provided for record purposes and are to be attached to the certificate.

1.9.3 Where fabrication welding is involved, see 1.2.14, any repair of defects is to be carried out in accordance with the approved welding procedure.

1.9.4 The forging manufacturer is to maintain records of repairs and subsequent inspections traceable to each forging. The records are to be presented to the Surveyor on request.

1.10 Identification

1.10.1 The manufacturer is to adopt a system of identification, which will enable all finished forgings to be traced to the original cast, forging process and heat treatment batch, and the Surveyor is to be given full facilities for so tracing the castings when required.

1.10.2 Forgings are to be clearly marked by the manufacturer in accordance with the requirements of Chapter 1. The following details are to be shown on all forgings which have been accepted:

- (a) Identification number, cast number or other marking which will enable the full history of the forging to be traced.
- (b) LR or Lloyd's Register and the abbreviated name of LR's local office.
- (c) Personal stamp of Surveyor responsible for inspection.
- (d) Test pressure, where applicable.
- (e) Date of final inspection.

1.10.3 Modified arrangements for the identification of small forgings manufactured in large numbers, as with closed-die forgings may be agreed with the Surveyor.

1.11 Certification

1.11.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each forging or batch of forgings which has been accepted:

- (a) Purchaser's name and order number.
- (b) Description of forgings and steel quality.
- (c) Identification number.
- (d) Steelmaking process, cast number and chemical analysis of ladle samples.
- (e) General details of heat treatment.
- (f) Results of mechanical tests.
- (g) Test pressure, where applicable.

1.11.2 The chemical composition of ladle samples is to include the content of all the elements detailed in the specific requirements.

1.11.3 Where applicable, the manufacturer is also to provide a signed statement regarding ultrasonic examination as required by 1.8.7, a report of magnetic particle inspection and a statement and/or sketch detailing all repairs by welding as required by 1.9.2.

1.11.4 When steel is not produced at the works at which it is forged, a certificate is to be supplied by the steelmaker stating the process of manufacture, cast number and the chemical composition of ladle samples. The works at which the steel was produced is to have been approved by LR, see 1.4.3.

Section 2 Forgings for ship and other structural applications

2.1 Scope

2.1.1 This Section gives the specific requirements for carbon-manganese steel forgings intended for ship and other structural applications such as rudder stocks, pintles, etc.

2.1.2 Where it is proposed to use an alloy steel, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval, see 1.4.3.

2.2 Chemical composition

2.2.1 For forgings to which structural items are to be attached by welding or which are intended for parts of a fabricated component, or are to be weld clad or may be subject to weld repair in service, the chemical composition of ladle samples is to comply with the following:

Carbon	0,23% max.
Silicon	0,45% max.
Manganese	0,30–1,50% but not less than 3 times the actual carbon content for components which are not given a post-weld heat treatment
Sulphur	0,035% max.
Phosphorus	0,035% max.
Residual elements:	
Copper	0,30% max.
Chromium	0,30% max.
Molybdenum	0,15% max.
Nickel	0,40% max.
Total	0,85% max.

For samples from forgings, the carbon content is not to exceed 0,26 per cent.

2.2.2 It is recommended that forgings for rudder stocks, pintles and rudder coupling bolts comply with 2.2.1 in order to obtain satisfactory weldability for any future repairs by welding in service.

2.2.3 For forgings not intended for welding the carbon content may be 0,65% max, see 3.2.1.

2.3 Heat treatment

2.3.1 Carbon-manganese steel forgings are to be:

- fully annealed; or
- normalised; or
- normalised and tempered at a temperature of not less than 550°C.
- quenched and tempered.

2.3.2 Alloy steel forgings are to be quenched and then tempered at a temperature of not less than 550°C. Alternatively, they may be supplied in the normalised and tempered condition, in which case the specified mechanical properties are to be agreed by LR.

2.4 Mechanical tests

2.4.1 At least one tensile specimen is to be taken from each forging or batch of forgings.

2.4.2 Where a forging exceeds both 4 tonnes in mass and 3 m in length, tensile test specimens are to be taken from each end. These limits refer to the 'as forged' mass and length but exclude the test material.

2.4.3 Unless otherwise agreed between the manufacturer and the Surveyor, the test specimens are to be cut in a longitudinal direction.

2.4.4 The results of all tensile tests are to comply with the requirements given in Table 5.2.1 appropriate to the specified minimum tensile strength. Forgings may be supplied to any specified minimum tensile strength within the general limits given in Table 5.2.1, and intermediate values may be obtained by interpolation. See 2.4.6 for rudder stocks, pintles, and rudder coupling keys and bolts.

2.4.5 For large forgings, where tensile tests are taken from each end, the variation in tensile strength is not to exceed 70 N/mm².

2.4.6 For rudder stocks, pintles, and rudder coupling keys and bolts, the minimum specified yield strength is not to be less than 200 N/mm², see Table 13.2.4 in Pt 3, Ch 13.

2.4.7 Impact tests are required for rudder stocks to be fitted to vessels which have an ice class notation. The tests are to be carried out at minus 10°C and the average energy value is to be not less than 27J.

Table 5.2.1 Mechanical properties for ship and other structural applications

Steel type	Yield stress N/mm ² minimum	Tensile strength N/mm ²	Elongation on $5,65\sqrt{S_0}$ min. %		Reduction of area min. %	
			Long.	Tang.	Long.	Tang.
C and C-Mn	180	360-480	28	20	50	35
	200	400-520	26	19	50	35
	220	440-560	24	18	50	35
	235	470-590	23	17	45	35
	240	480-600	22	16	45	30
	260	520-640	21	15	45	30
	280	560-680	20	14	40	27
	300	600-750	18	13	40	27
	320	640-790	17	12	40	27
	340	680-830	16	12	35	24
	360	720-870	15	11	35	24
Alloy	380	760-910	14	10	35	24
	350	550-570	20	14	50	35
	400	600-750	18	13	50	35
	450	650-800	17	12	50	35

Section 3 Forgings for shafting and machinery

3.1 Scope

3.1.1 Detailed in this Section are the requirements for carbon-manganese steel forgings for shafting and other items of machinery which are not within the scope of Sections 4 to 8.

3.1.2 Where it is proposed to use alloy steel forgings, particulars of the chemical composition, mechanical properties and heat treatment are to be submitted for approval. For main propulsion shafting in alloy steels, the specified minimum tensile strength is not to exceed 800 N/mm² (800–950 N/mm² acceptance range) and for other forgings is not to exceed 1100 N/mm² (1100–1300 N/mm² acceptance range).

3.2 Chemical composition

3.2.1 The chemical composition of ladle samples for carbon and carbon-manganese steels is to comply with the following overall limits:

Carbon	0,65% max.
Silicon	0,45% max.
Manganese	0,30–1,50%
Sulphur	0,035% max.
Phosphorus	0,035% max.
Residual elements:	
Copper	0,30% max.
Chromium	0,30% max.
Molybdenum	0,15% max.
Nickel	0,40% max.
Total	0,85% max.

3.2.2 For alloy steels, see 1.4.3.

3.2.3 For forgings to which structural items are to be attached by welding, or which are intended for parts of a fabricated component, are to be of weldable quality, see 2.2.1.

3.3 Heat treatment

3.3.1 Forgings are to be:

- (a) fully annealed; or
- (b) normalised; or
- (c) normalised and tempered; or
- (d) quenched and tempered.

The tempering temperature is to be not less than 550°C.

3.4 Mechanical tests

3.4.1 At least one tensile test is to be made on each forging, or each batch of forgings. Impact tests are not required except on screwshafts for ice service, see 3.4.12.

3.4.2 Where a forging exceeds both 4 tonnes in mass and 3 m in length, a tensile test is to be taken from each end. These limits refer to the 'as forged' mass and length but exclude the test material.

3.4.3 A batch testing procedure may be used for hot rolled bars not exceeding 250 mm diameter, which are intended for the manufacture (by machining operations only) of straight shafting, bolts, studs and other machinery components of similar shape. A batch is to consist of either:

- (a) material from the same piece provided that where this is cut into individual lengths, these are all heat treated in the same furnace charge; or
- (b) bars of the same diameter and cast, heat treated in the same furnace charge and with a total mass not exceeding 2,5 tonnes.

3.4.4 The test specimens are to be taken in the longitudinal direction but, at the discretion of the manufacturer and if agreed by the Surveyor, alternative directions or positions as shown in Figs. 5.3.1 to 5.3.3 may be used.

3.4.5 For carbon-manganese steels, Table 5.3.1 gives the minimum requirements for yield stress, elongation and reduction of area, corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. Intermediate values for other specified minimum tensile strengths should be calculated by interpolation.

3.4.6 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 5.3.1, except that for main propulsion shafting forgings the specified minimum tensile strength is to be not less than 400 N/mm² (400–520 N/mm² acceptance range) and not greater than 600 N/mm² (600–750 N/mm² acceptance range) see shaded area of Table 5.3.1.

3.4.7 The results of all tensile tests are to comply with the requirements given in Table 5.3.1 appropriate to the specified minimum tensile strength.

3.4.8 The minimum requirements for yield stress, elongation and reduction of area, corresponding to different strength levels in alloy steel forgings are given in Table 5.3.2.

3.4.9 Forgings in alloy steels may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 5.3.2, and minimum yield stress, elongation and reduction of area, obtained by interpolation, except that for main propulsion shafting forgings the specified minimum tensile strength is not to exceed 800 N/mm² (800–950 N/mm² acceptance range) see shaded area of Table 5.3.2.

Table 5.3.1 Mechanical properties for acceptance purposes: carbon and carbon-manganese steel forgings for machinery and shafting

Tensile strength N/mm ²	Yield stress N/mm ²	Elongation on 5,65√S ₀ min. %		Reduction of area min. %	
		Long.	Tang.	Long.	Tang.
360-480	180	28	20	50	35
400-520	200	26	19	50	35
440-560	220	24	18	50	35
470-590	235	23	17	45	35
480-600	240	22	16	45	30
520-640	260	21	15	45	30
560-680	280	20	14	40	27
600-750	300	18	13	40	27
640-790	320	17	12	40	27
680-830	340	16	12	35	24
700-850 ²	350	15	11	35	24
720-870 ²	360	15	11	35	24
760-910 ²	380	14	10	35	24

NOTES

- For main propulsion shafting forgings, the specified minimum tensile strength is to be between 400 and 600 N/mm² (shaded area of Table) see 3.4.6.
- Where the specified minimum tensile strength exceeds 700 N/mm², forgings are to be supplied only in the quenched and tempered condition.

Steel Forgings

Chapter 5

Sections 3 & 4

Table 5.3.2 Mechanical properties for acceptance purposes: alloy steel forgings for machinery and shafting

Tensile strength N/mm ²	Yield stress N/mm ²	Elongation on 5,65√ <i>S</i> ₀ min. %		Reduction of area min. %	
		Long.	Tang.	Long.	Tang.
600-750	420	18	14	50	35
650-800	450	17	13	50	35
700-850	480	16	12	45	30
750-900	530	15	11	45	30
800-950	580	14	10	40	27
850-1000	630	13	9	40	27
900-1100	690	13	9	40	27
950-1150	750	12	8	35	24
1000-1200	810	12	8	35	24
1050-1250	870	11	7	35	24
1100-1300	930	11	7	35	24

NOTE
For main propulsion shafting forgings, the minimum specified tensile strength is not to exceed 800 N/mm², see 3.4.9 (shaded area of Table).

3.4.10 The results of all tensile tests are to comply with the requirements given in Table 5.3.2 appropriate to the specified minimum tensile strength.

3.4.11 Where more than one tensile test is taken from a forging, the variation in tensile strength is not to exceed the following:

Specified minimum tensile strength N/mm ²	Difference in tensile strength N/mm ²
<600	70
≥600 < 900	100
≥900	120

3.4.12 For screwshafts intended for ships with the notation **Ice Class 1AS** or **1A** and where the connection between the propeller and the screwshaft is by means of a key, a set of three Charpy V-notch impact tests (longitudinal test) is to be made on material from the propeller end of each shaft. The tests are to be carried out at -10°C and the average energy value is to be not less than 27 J.

3.5 Non-destructive examination

3.5.1 Magnetic particle or dye penetrant testing is to be carried out on forgings for main propulsion shafting, on all connecting rod forgings and on the following components when they are intended for engines having a bore diameter larger than 400 mm:

- Cylinder covers
- Piston crowns
- Piston rods
- Tie rods
- Gear wheels for camshaft drives
- Bolts and studs for:
 - Cylinder covers
 - Crossheads
 - Main bearings
 - Connecting rod bearings.

3.5.2 The areas to be tested are those where experience shows defects are most likely to occur, and are to be mutually agreed between the Surveyor and the manufacturer. For tie rods, only threaded portions and the adjacent material over a length equal to that of the thread need be tested. The test results are to be to the Surveyor's satisfaction.

3.5.3 Ultrasonic testing is to be carried out on the following items:

- (a) Shafts having a finished diameter of 250 mm or larger when intended for main propulsion or other essential services.
- (b) All piston crowns and cylinder covers.
- (c) Piston and connecting rods for engines having a bore diameter greater than 400 mm.

The test results are to be to the Surveyor's satisfaction.

Section 4 Forgings for crankshafts

4.1 Scope

4.1.1 The specific requirements for solid forged crankshafts and forgings for use in the construction of fully built and semi-built crankshafts are detailed in this Section.

4.1.2 Where it is proposed to use alloy steel forgings, particulars of the chemical composition (see 1.4.3), heat treatment and mechanical properties are to be submitted for approval. The specified minimum tensile strength is not to exceed 1000 N/mm² (1000–1200 N/mm² acceptance range).

4.2 Manufacture

4.2.1 For closed die and continuous grain flow crankshafts forgings, where an allowance is given for design purposes, full details of the proposed method of manufacture are to be submitted for approval. In such cases, tests will be required to demonstrate that a satisfactory structure and grain flow are obtained. The number and positions of test specimens are to be agreed with LR.

4.2.2 For the manufacture of welded crankshafts, approval is required for the welding procedure.

4.2.3 For combined crankweb and pin forgings, the proposed method of forging is to be submitted for approval. It is recommended that these forgings be made by a folding method. Other methods which can be shown to produce sound forgings with satisfactory mechanical properties will be considered, but where the gapping method is used for cranks having a pin diameter exceeding 510 mm this will only be accepted provided that an upsetting operation is included in the manufacturing sequence. In general, the amount of work during the upsetting operation is to be such that the reduction in the original length of the ingot (after discard) or bloom is not less than 50 per cent.

4.2.4 Where crankwebs are flame cut from forged or rolled slabs, the procedure used is to be in accordance with 1.2.13, and additionally, unless specially agreed, a depth of at least 7,5 mm is to be removed by machining from all flame-cut surfaces.

4.3 Chemical composition

4.3.1 The chemical composition of ladle samples is to comply with 3.2.1 for carbon and carbon-manganese steels and 1.4.3 for alloy steels.

4.3.2 For alloy steel forgings which are to be nitrided, the phosphorus or sulphur contents are not to exceed 0,02 per cent.

4.4 Heat treatment

4.4.1 For forgings in all types of steels, heat treatment is to be either:

- (a) normalising and tempering, or
- (b) quenching and tempering.

The temperature used for tempering is to be not less than 550°C.

4.4.2 Where it is proposed to surface harden crankshaft forgings by nitriding or induction hardening, full details of the proposed procedure are to be submitted as required by 1.5.6.

4.5 Mechanical tests

4.5.1 At least one tensile test specimen is to be taken from each forging.

4.5.2 For solid forged crankshafts, tests are to be taken in the longitudinal direction from the coupling end of each forging (test position A in Fig. 5.4.1). Where the mass, as heat treated but excluding test material, exceeds 3 tonnes, tests are to be taken from the end opposite the coupling, in addition (test position B in Fig. 5.4.1). Where the crankthrows are formed by machining or flame cutting, the second set of tests is to be taken in a tangential direction from material removed from the crankthrow at the end opposite the coupling (test position C in Fig. 5.4.1).

Fig. 5.4.1 Solid forged crankshaft

4.5.3 The number and position of test specimens from combined crankweb and pin forgings are to be in accordance with the requirements of the approved method of manufacture.

4.5.4 For other crankshaft forgings, tests are to be taken as detailed in Section 3, except that for crankwebs the test specimens are to be cut in a tangential direction.

4.5.5 As an alternative to 4.5.2, small solid forged crankshafts may be batch tested in accordance with 1.6.4, provided that, in addition, hardness tests are carried out on each forging.

4.5.6 Tables 5.4.1 to 5.4.3 give the minimum requirements for yield stress and elongation corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. The strength levels have been given in multiples of 40 N/mm², or 50 N/mm² in the case of alloy steels, to facilitate interpolation for intermediate values of specified minimum tensile strength.

Table 5.4.1 Mechanical properties for acceptance purposes: carbon-manganese steel forgings for crankshafts

Tensile strength N/mm ²	Yield stress N/mm ² minimum	Elongation on $5,65\sqrt{S_0}$ % minimum		Hardness Brinell
		Long.	Tang.	
400–520	200	26	19	110–150
440–560	220	24	18	125–160
480–600	240	22	16	135–175
520–640	260	21	15	150–185
560–680	280	20	14	160–200
600–750	300	18	13	175–215
640–790	320	17	12	185–230
680–830	340	16	12	200–240
720–870	350	15	11	210–250
760–910	380	14	18	225–265

Intermediate values may be obtained by interpolation.

Table 5.4.2 Mechanical properties for acceptance purposes: alloy steel forgings for crankshafts – Normalised and tempered

Tensile strength N/mm ²	Yield stress N/mm ² minimum	Elongation on 5,65√S ₀ % minimum		Hardness Brinell
		Long.	Tang.	
600–750	330	18	14	175–215
650–800	355	17	13	190–235
700–850	380	16	12	205–245
750–900	405	15	11	215–260
800–950	430	14	10	235–275
Intermediate values may be obtained by interpolation.				

Table 5.4.3 Mechanical properties for acceptance purposes: alloy steel forgings for crankshafts – Quenched and tempered

Tensile strength N/mm ²	Yield stress N/mm ² minimum	Elongation on 5,65√S ₀ % minimum		Hardness Brinell
		Long.	Tang.	
600–750	420	18	14	175–215
650–800	450	17	13	190–235
700–850	380	16	12	205–245
750–900	530	15	11	215–260
800–950	590	14	10	235–275
850–1000	640	13	9	245–290
900–1100	690	13	9	260–320
950–1150	750	12	8	275–340
1000–1200	810	12	8	290–365
Intermediate values may be obtained by interpolation.				

4.5.7 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Tables 5.4.1 to 5.4.3.

4.5.8 The results of all tensile tests are to comply with the requirements of Table 5.4.1, 5.4.2 or 5.4.3 appropriate to the specified minimum tensile strength.

4.5.9 Where more than one tensile test is taken from a forging, the variation in tensile strength is not to exceed the following:

Specified minimum tensile strength N/mm ²	Difference in tensile strength N/mm ²
<600	70
≥600 <900	100
≥900	120

4.5.10 For small crankshaft forgings which have been batch tested, the hardness values are to be not less than those given in Tables 5.4.1 to 5.4.3, as appropriate. The variation in hardness in each batch is to comply with the following:

Specified minimum tensile strength (N/mm ²)	Difference in hardness (Brinell number)
<600	not more than 25
≥600 <900	not more than 35
≥900	not more than 42

4.6 Non-destructive examination

4.6.1 Magnetic particle or dye penetrant testing as detailed in 1.8.5 is to be carried out on all forgings for crankshafts. Where applicable, this is to include all surfaces which have been flame-cut, but not subsequently machined during manufacture. Particular attention is to be given to the testing of the pins, journals and associated fillet radii of solid forged crankshafts and to the pins and fillet radii of combined web and pin forgings.

4.6.2 The manufacturer is to carry out an ultrasonic examination of all forgings as detailed in 1.8.7, except that for closed-die forgings this examination may, subject to approval, be confined to the initial production and to subsequent occasional checks.

Section 5
Forgings for gearing

5.1 Scope

5.1.1 Provision is made in this Section for carbon-manganese and alloy steel forgings intended for use in the construction of gearing for main propulsion and for driving electric generators.

5.1.2 Gear wheel and rim forgings with a specified minimum tensile strength not exceeding 760 N/mm² (760–910 N/mm² acceptance range) may be made in carbon-manganese steel. Gear wheel or rim forgings where the specified minimum tensile strength is in excess of 760 N/mm², and all pinion or pinion sleeve forgings, are to be made in a suitable alloy steel. Specifications for alloy steel components and for quill shafts, giving chemical composition, heat treatment and mechanical properties, are to be submitted for approval.

5.1.3 Forgings for flexible couplings, quill shafts and gear wheel shafts are to comply with the requirements of Section 3.

5.1.4 Manufacturers’ test certificates for forgings may be accepted where the transmitted power does not exceed 220 kW (300 shp) for main propulsion and 100 kW (150 shp) for auxiliary drives.

5.2 Manufacture

5.2.1 All forgings are to be made with sufficient material to allow an adequate machining allowance on all surfaces for the removal of unsound or decarburised material.

5.2.2 The hardenability of the forged material is to be checked at random intervals using an end quench test complying with a National or International Standard.

5.2.3 The grain size is to be checked on a random basis in accordance with the testing and reporting procedures of ASTM E 112, or an equivalent National Standard, and is to be within the range 5 to 8.

5.2.4 The microstructure of the hardened case is to be mainly martensite, with a maximum content of 15 per cent of retained austenite.

5.3 Chemical composition

5.3.1 The chemical composition of ladle samples is to comply with 3.2.1. for carbon and carbon-manganese steels and 1.4.3 for alloy steels.

5.4 Heat treatment

5.4.1 Except as provided in 5.4.4 and 5.4.5, forgings may be either normalised and tempered or quenched and tempered in accordance with the approved specification. The tempering temperature is to be not less than 550°C.

5.4.2 Where forgings are machined prior to heat treatment, the allowance left for final machining is to be sufficient to remove the decarburised surface material, taking into account any bending or distortion which may occur.

5.4.3 When the teeth of a pinion or gear wheel are to be surface hardened, i.e. carburised, nitrided or induction hardened, the proposed specification together with details of the process and practice are to be submitted for approval. For purposes of initial approval, the gear manufacturer is required to demonstrate by test that the surface hardening of the teeth is uniform and of the required depth and that it does not impair the soundness and quality of the steel.

5.4.4 Where induction hardening or nitriding is to be carried out after machining of the gear teeth, the forgings are to be heat treated at an appropriate stage to a condition suitable for this subsequent surface hardening.

5.4.5 Forgings for gears which are to be carburised after final machining are to be supplied in either the fully annealed or the normalised and tempered condition, suitable for subsequent machining and carburising.

5.5 Mechanical tests for through hardened, induction hardened or nitrided forgings

5.5.1 At least one tensile test specimen is to be taken from each forging in carbon or carbon-manganese steel, and at least one tensile test specimen from forgings in alloy steel. Sufficient test material is to be provided for this purpose and the test specimens are to be taken as follows:

- For pinion forgings where the finished diameter of the toothed portion exceeds 200 mm, tests are to be taken in a tangential direction and adjacent to the toothed portion (test position B in Fig. 5.5.1). Where the dimensions preclude the preparation of tests from this position, tests in a tangential direction are to be taken from the end of the journal (test position C in Fig. 5.5.1). If, however, the journal diameter is 200 mm or less, tests are to be taken in a longitudinal direction (test position A in Fig. 5.5.1). Where the finished length of the toothed portion exceeds 1250 mm, tests are to be taken from each end.
- For small pinion forgings where the finished diameter of the toothed portion is 200 mm or less, tests are to be taken in a longitudinal direction (test position A in Fig. 5.5.1).
- For gear wheel forgings, tests are to be taken in a tangential direction (from one of the test positions B in Fig. 5.5.2).
- For gear wheel rim forgings, tests are to be taken in a tangential direction (from one of the test positions A in Fig. 5.5.3). Where the finished diameter exceeds 2500 mm or the mass (as heat treated but excluding test material) exceeds 3 tonnes, tests are to be taken from two diametrically opposite positions (test positions A in Fig. 5.5.3).
- For pinion sleeve forgings, tests are to be taken in a tangential direction (from one of the test positions C in Fig. 5.5.4). Where the finished length exceeds 1250 mm, tests are to be taken from each end.

5.5.2 As an alternative to 5.5.1, small forgings may be batch tested in accordance with 1.6.4 provided that, in addition, hardness tests are carried out on each forging.

5.5.3 Tables 5.5.1 to 5.5.3 give the minimum requirements for yield stress and elongation corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. The strength levels have been given in multiples of 40 N/mm², or 50 N/mm² in the case of alloy steels, to facilitate interpolation for intermediate values of specified minimum tensile strength.

5.5.4 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Tables 5.5.1 to 5.5.3.

Table 5.5.1 Mechanical properties for acceptance purposes: carbon-manganese steels for gear wheel and rim forgings

Tensile strength N/mm ² (see Note)	Yield stress N/mm ² minimum	Elongation on 5,65 $\sqrt{S_0}$ % minimum		Hardness Brinell
		Rims	Wheels	
400–520	200	26	22	110–150
440–560	220	24	21	125–160
480–600	240	22	19	135–175
520–640	260	21	18	150–185
560–680	280	20	17	160–200
600–750	300	18	15	175–215
640–790	320	17	14	185–230
680–830	340	16	14	200–240
720–870	360	15	13	210–250
760–910	380	14	12	225–265

Intermediate values may be obtained by interpolation.

NOTE
When the specified minimum tensile strength exceeds 700 N/mm² forgings are to be supplied only in the quenched and tempered condition.

Table 5.5.2 Mechanical properties for acceptance purposes: alloy steel gear wheel and rim forgings – Normalised and tempered

Tensile strength N/mm ²	Yield stress N/mm ² minimum	Elongation on 5,65 $\sqrt{S_0}$ % minimum		Hardness Brinell
		Rims	Wheels	
600–750	330	18	16	175–215
650–800	355	17	15	190–235
700–850	380	16	14	205–245
750–900	405	15	13	215–260
800–950	430	14	12	235–275
850–1000	455	13	11	245–290

Intermediate values may be obtained by interpolation.

5.5.5 The results of all tensile tests are to comply with the requirements of Table 5.5.1, 5.5.2 or 5.5.3, appropriate to the specified minimum tensile strength. Unless otherwise agreed, the specified minimum tensile strength is to be not less than 800 N/mm² (800–950 N/mm² acceptance range) for induction hardened or nitrided gear forgings.

5.5.6 Where more than one tensile test is taken from a forging, the variation in tensile strength is not to exceed the following:

Specified minimum tensile strength N/mm ²	Difference in tensile strength N/mm ²
<600	70
≥600 <900	100
≥900	120

Steel Forgings

Chapter 5

Section 5

Table 5.5.3 Mechanical properties for acceptance purposes: alloy steel gear forgings – Quenched and tempered

Tensile strength N/mm ² (see Notes 1 and 2)	Yield stress N/mm ² minimum (see Note 2)	Elongation on $5,65\sqrt{S_0}$ % minimum			Hardness Brinell
		A	B	C	
600–750	420	18	16	14	175–215
650–800	450	17	15	13	190–235
700–850	480	16	14	12	205–245
750–900	530	15	13	11	215–260
800–950	590	14	12	10	235–275
850–1000	640	13	11	9	245–290
900–1050	690	13	11	9	260–310
950–1100	750	12	10	8	275–330
1000–1150	810	12	10	8	290–340
1050–1200	870	11	9	7	310–365
Column A is applicable to tests from gear rims and to longitudinal tests from pinions. Column B is applicable to tests from gear wheels and to tangential tests from pinions. Column C is applicable to tests from pinion sleeves.					
Intermediate values may be obtained by interpolation.					
NOTES 1. For gear wheel and rim forgings the specified minimum tensile strength is not to exceed 850 N/mm ² . 2. For carburised gear forgings the requirements for minimum yield stress and maximum tensile strength are not applicable.					

5.5.7 Hardness tests are to be carried out on all forgings after completion of heat treatment and prior to machining the gear teeth. The hardness is to be determined at four positions equally spaced around the circumference of the surface where teeth will subsequently be cut. Where the finished diameter of the toothed portion exceeds 2500 mm, the number of test positions is to be increased to eight. Where the width of a gear wheel rim forging exceeds 1250 mm, the hardness is to be determined at eight positions at each end of the forging.

5.5.8 For small gear forgings which are batch tested, at least one hardness test is to be carried out on each forging.

5.5.9 The results of all hardness tests are to comply with the appropriate requirements of Tables 5.5.1 to 5.5.3. The difference between the highest and lowest values on any one forging is not to exceed the following:

Specified minimum tensile strength (N/mm ²)	Difference in hardness (Brinell number)
<600	25
≥600 <900	35
≥900	42

5.5.10 On nitrided or induction hardened components, hardness tests are also to be made on the teeth when surface hardening and grinding have been completed. The results are to comply with the approved specification.

5.6 Mechanical tests for carburised forgings

5.6.1 Sufficient test material is to be provided for preliminary tests at the forge and for final tests after completion of carburising. For this purpose, duplicate sets of test material are to be taken from positions as detailed in 5.5.1, except that, irrespective of the dimensions or mass of the forging, tests are required from one position only, and in the case of forgings with integral journals are to be cut in a longitudinal direction. The test material which is to be used for measurements of case depth, hardness, grain size and residual austenite as well as mechanical properties is to be machined to a coupon of diameter of $\frac{D}{4}$ or 30 mm, whichever is less, where D is the finished diameter of the toothed portion.

5.6.2 For small forgings, where a system of batch testing is adopted, the test material may be prepared from surplus steel from the same cast provided that the forging reduction approximates to that of the actual gear forgings. The test samples are to be correctly identified and heat treated with the forgings they represent.

5.6.3 For preliminary tests at the forge, one set of test material is to be given a blank carburising and heat treatment cycle simulating that which will be subsequently applied to the forgings.

5.6.4 For final acceptance tests, the second set of test material is to be blank carburised and heat treated together with the forgings which it represents.

5.6.5 At the discretion of the forgemaster or gear manufacturer, test samples of larger cross-section than in 5.6.1 may be either carburised or blank carburised, but these are to be machined to the required diameter prior to the final quenching and stress relieving heat treatment.

5.6.6 At least one tensile specimen is to be prepared from each sample of test material.

5.6.7 Unless otherwise agreed, the specified minimum tensile strength is to be not less than 750 N/mm², and the results of all tensile tests are to comply with the requirements given in Table 5.5.3.

5.6.8 Where it is proposed to adopt alternatives to the requirements of 5.6.1 to 5.6.7, full details are to be submitted to the Surveyor for consideration.

5.7 Non-destructive examination

5.7.1 Magnetic particle or liquid penetrant testing is to be carried out on the teeth of all surface hardened forgings. This examination may also be requested on the finished machined teeth of through hardened gear forgings.

5.7.2 The manufacturer is to carry out an ultrasonic examination of all forgings where the finished diameter of the surfaces, where teeth will be cut, is in excess of 200 mm, and is to provide the Surveyor with a signed statement that such inspection has not revealed any significant internal defects.

5.7.3 On gear forgings where the teeth have been surface hardened, additional test pieces may be required to be processed with the forgings and subsequently sectioned to determine the depth of the hardened zone. These tests are to be carried out at the discretion of the Surveyor, and for induction or carburised gearing the depth of the hardened zone is to be in accordance with the approved specification. For nitrided gearing, the full depth of the hardened zone, (i.e. depth to core hardness), is to be not less than 0,5 mm and the hardness at a depth of 0,25 mm is to be not less than 500 HV.

Section 6 Forgings for turbines

6.1 Scope

6.1.1 Provision is made in this Section for ferritic steel forgings for turbine rotors, discs and spindles, turbine-driven generator rotors and compressor rotors.

6.1.2 Plans for rotor forgings are to state whether the rotor is intended for propulsion or auxiliary machinery and the shaft power of auxiliary turbines. In the case of a rotor which is to be tested for thermal stability, the maximum operating temperature and the proposed test temperature are also to be stated.

6.1.3 Specifications of alloy steel forgings giving the proposed chemical composition, heat treatment and mechanical properties are to be submitted for approval with the plans of the components.

6.1.4 Where it is proposed to use rotors of welded construction, the compositions of the steels for the forgings are to be submitted for special consideration, together with details of the proposed welding procedure. Welding procedure tests may be required.

6.2 Manufacture

6.2.1 Forgings are to be manufactured in accordance with the requirements of Section 1, except that for rotors the forging reduction is to be not less than 2,5 to 1. Where an upsetting operation is included in the manufacturing procedure, the above requirement applies to the cross-sectional area of the upset bloom and not to that of the ingot.

6.3 Chemical composition

6.3.1 The chemical composition of ladle samples is to comply with 3.2.1 for carbon and carbon-manganese steels and 1.4.3 for alloy steels.

6.4 Heat treatment

6.4.1 Forgings are to be supplied in the heat treated condition, and the thermal treatment at all stages is to be such as to avoid the formation of hair-line cracks. At a suitable stage of manufacture, the forgings are to be reheated above the upper critical point to refine the grain, cooled in an approved manner and then tempered to produce the desired mechanical properties.

6.4.2 Where forgings receive their main heat treatment before machining, they are to be stress relieved after rough machining. Forgings which are heat treated in the rough machined condition need not be stress relieved provided that they have been slowly cooled from the tempering temperature.

6.4.3 The tempering and stress relieving temperatures are to be not less than 550°C for carbon and carbon-manganese steels, and not less than 600°C for alloy steels. The holding times and subsequent cooling rates are to be such that the forging in its final condition is free from harmful residual stresses.

6.4.4 Details of the proposed heat treatment for rotors of welded construction are to be submitted for approval.

6.5 Mechanical tests

6.5.1 At least one tensile test specimen, cut in a longitudinal direction, is to be taken from each rotor forging. For forgings exceeding both 3 tonnes in mass and 2000 mm in length, tests are to be taken from each end.

6.5.2 For rotor forgings of all main propulsion machinery and of auxiliary turbines exceeding 1100 kW, tangential and, where the dimensions permit, radial tensile tests are to be taken from the end of the body corresponding to the top end of the ingot, see Fig. 5.6.1.

Fig. 5.6.1 Test positions for turbine rotor forgings

6.5.3 For each turbine disc, at least one tensile test specimen is to be cut in a tangential direction from material at the hub, see Fig. 5.6.2.

Steel Forgings

Chapter 5

Section 6

Fig. 5.6.2 Test positions for turbine disc forgings

6.5.4 For the tests required by 6.5.1 to 6.5.3, sufficient test material is to be left on each forging and is not to be removed until all heat treatment, including stress relieving, has been completed. In this connection, a thermal stability test does not form part of the heat treatment of a turbine forging. Any excess test material is not to be completely severed from a forging until all the mechanical tests have been completed with satisfactory results.

6.5.5 Tables 5.6.1 and 5.6.2 give the minimum requirements for yield stress, elongation and reduction of area corresponding to different strength levels, but it is not intended that these should necessarily be regarded as specific grades. The strength levels have been given in multiples of 40 N/mm², or 50 N/mm² for alloy steels, to facilitate interpolation for intermediate values of specified minimum tensile strength.

Table 5.6.1 Mechanical properties for acceptance purposes: carbon-manganese steel forgings for turbines – Normalised and tempered

Tensile strength N/mm ²	Yield stress N/mm ² minimum	Elongation $5,65\sqrt{S_0}$ % minimum			Reduction of area % minimum		
		A	B	C	A	B	C
400–520	200	26	22	18	50	40	35
440–560	220	24	21	17	50	40	35
480–600	240	22	19	15	45	35	30
520–640	260	21	18	14	45	35	30
560–680	280	20	17	13	40	30	25
600–720	300	18	15	12	40	30	25

NOTES
Columns A are applicable to longitudinal tests from rotor and spindle forgings.
Columns B are applicable to tangential tests from rotor forgings.
Columns C are applicable to radial tests from rotor forgings.
Intermediate values may be obtained by interpolation.

6.5.6 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 5.6.1 or Table 5.6.2.

Table 5.6.2 Mechanical properties for acceptance purposes: alloy steel forgings for turbines – Quenched and tempered or normalised and tempered

Tensile strength N/mm ² (see Note)	Yield stress N/mm ² minimum Normalised and tempered	Yield stress N/mm ² minimum Quenched and tempered	Elongation on $5,65\sqrt{S_0}$ % minimum			Reduction of area % minimum		
			A	B	C	A	B	C
500 – 650	275	—	22	20	18	50	40	35
550 – 700	300	—	20	18	16	50	40	35
600 – 750	330	410	18	16	14	50	40	35
650 – 800	355	450	17	15	13	50	40	35
700 – 850	385	490	16	14	12	45	35	30
750 – 900	—	530	15	13	11	45	35	30
800 – 950	—	590	14	12	10	45	35	30
850 – 1000	—	640	13	11	9	40	30	25
900 – 1050	—	690	13	11	9	40	30	25
950 – 1100	—	750	12	10	8	40	30	25
1000 – 1150	—	810	12	10	8	40	30	25

NOTES
Columns A are applicable to longitudinal tests from rotor and spindle forgings.
Columns B are applicable to tangential tests from rotor and spindle forgings, and to tangential tests from discs – test position B in Fig. 5.6.2.
Columns C are applicable to radial test from rotor forgings and to tangential tests from discs – test position C in Fig. 5.6.2.
Intermediate values may be obtained by interpolation.

6.5.7 The results of all tensile tests are to comply with the requirements of Table 5.6.1 or Table 5.6.2 appropriate to the specified minimum tensile strength. For monobloc rotor forgings, the specified minimum tensile strength is not to exceed 800 N/mm².

6.6 Non-destructive examination

6.6.1 The end faces of the body of rotor forgings and the end faces of the boss and the bore surface of each turbine disc are to be machined to a fine smooth finish for visual and magnetic particle examination.

6.6.2 The manufacturer is to carry out an ultrasonic examination of each forging and is to provide the Surveyor with a signed statement that such inspection has not revealed any significant internal defects.

6.6.3 Rotor forgings for propulsion machinery and for auxiliary turbines exceeding 1100 kW are to be hollow bored for internal examination. The surface of the bore is to have a fine smooth finish and is to be examined by means of an optical instrument of suitable magnification. Where the bore size permits, magnetic particle examination is also to be carried out. These examinations are to be confirmed by the Surveyor. Alternatively, an approved method of ultrasonic examination may be accepted instead of hollow boring. Details of the proposed method of ultrasonic examination are to be submitted for special consideration.

6.7 Thermal stability tests

6.7.1 Thermal stability tests after heat treatment and rough machining of the turbine rotors, referred to in the relevant Rules dealing with design and construction, are to be undertaken in properly constructed furnaces, using accurate and reliable measuring equipment. Each test is to be carried out in accordance with the following recommended procedure:

- (a) Five bands are to be machined concentric with the axis of rotation. Two of these are to be reference bands and are to be positioned at or near the locations of the bearings. The remaining three bands are to be test bands located one as near as possible to the mid-length, and the other two near each end of the body. Where the length of a rotor is such that five bands cannot be provided, alternative proposals are to be submitted to the Surveyor for his approval.
- (b) Four positions, 90° apart, are to be stamped A, B, C and D on the coupling end of the rotor.
- (c) The whole of the body, and as much of the shaft at either end as will include the positions of the glands, is to be enclosed in the furnace. In the case of a rotor having an overhung astern wheel, the astern wheel is also to be enclosed in the furnace during the first test.
- (d) The rotor is to be rotated at a uniform and very low speed.
- (e) The deflections at all bands are to be recorded at the A, B, C and D positions. Initial cold readings are to be taken prior to heating.
- (f) The rotor is to be heated uniformly and slowly. Temperatures are to be recorded continuously at the surface of the rotor and, if practicable, in the bore at the mid-length of the body. In no circumstances is the surface temperature to exceed the temperature at which the rotor

was tempered. During heating, the rate of rise of temperature is to be such as to avoid excessive temperature gradients in the rotor.

- (g) The maximum or holding temperature is to be not less than 28°C above the maximum operating temperature of the rotor. For the purposes of the test, the holding period is to start when the rotor has attained a uniform and specified temperature. The rotor is to be held under the specified temperature conditions until not less than three consecutive hourly readings of deflections show the radial eccentricity to be constant within 0,006 mm on all test bands.
- (h) The turbine rotor is to be rotated during cooling until the temperature is not more than 100°C. The rate of cooling is to be such as to avoid excessive temperature gradients in the rotor.
- (j) Final cold readings are to be taken.

6.7.2 The movements of the axis of the rotor in relation to the reference bands are to be determined from polar plots of the deflection readings. The radial movement of the shaft axis, as determined by the difference between the final hot and the final cold movements, is not to exceed 0,025 mm on any one band. As verification that test equipment and conditions are satisfactory, it is required that similar determinations of differences between initial cold and final cold movements do not exceed 0,025 mm on any one band.

6.7.3 If the results of the test on a rotor fail to meet either or both of the requirements in 6.7.2, the test may be repeated if requested by the maker and agreed by the Surveyor. In the case of a rotor failing to meet the requirements of a thermal stability test, the rotor is deemed unacceptable. Proposals for the rectification of thermal instability of a rough machined rotor are to be submitted for special consideration.

Section 7 Forgings for boilers, pressure vessels and piping systems

7.1 Scope

7.1.1 Provision is made in this Section for carbon-manganese and low alloy steel forgings intended for use in the construction of boilers, pressure vessels and piping systems where the design temperature is not lower than 0°C.

7.1.2 In addition to specifying mechanical properties at ambient temperature for the purposes of acceptance testing, these requirements give details of appropriate mechanical properties at elevated temperatures to be used for design purposes.

7.1.3 Forgings used in the construction of equipment for the containment of liquefied gases are to comply with the requirements of Section 8, except for those used in piping systems, where the design temperature is not lower than 0°C. Forgings for other pressure vessels and piping systems, where the use of steels with guaranteed impact properties at low temperatures is required, are also to comply with Section 8.

Steel Forgings

Chapter 5

Section 7

7.2 Chemical composition

7.2.1 The chemical composition of ladle samples is to comply with the appropriate requirements of Table 5.7.1.

7.3 Heat treatment

7.3.1 Carbon-manganese steel forgings are to be normalised, normalised and tempered or quenched and tempered.

7.3.2 Alloy steel forgings are to be normalised and tempered or quenched and tempered.

7.3.3 No forging is to be fully heat treated more than twice.

7.4 Mechanical tests

7.4.1 Except as provided in 7.4.2 and 7.4.4, at least one tensile test is to be taken from each forging and, where the dimensions and shape allow, the test specimen is to be cut in the longitudinal direction.

7.4.2 On seamless drums and headers which are initially forged with open ends, test material is to be provided at each end of each forging. Where forged with one solid end, test material is to be provided at the open end only. Except where the ends are to be subsequently closed by forging, the test material is not to be removed until heat treatment has been completed. Where the ends are to be closed, rings of test material are to be cut off prior to the closing operation and are to be heat treated with the finished forging. In all cases, the test specimens are to be cut in the circumferential direction.

7.4.3 Unless otherwise agreed, tensile test specimens are to be taken with their axis at approximately 12,5 mm below the surface of the forging.

7.4.4 Small forgings may be batch tested in accordance with 1.6.4 provided that hardness tests are carried out on each forging. In such cases, the mass of each forging is not to exceed 1 tonne and that of the batch is not to exceed 10 tonnes and the hardness values are to accord with Table 5.7.2.

7.4.5 If required by the Surveyors or by the Fabricators, test material may be given a simulated stress relieving heat treatment prior to the preparation of the test specimens. This has to be stated on the order, together with agreed details of the simulated heat treatment and the mechanical properties which can be expected.

7.4.6 Except as provided in 7.4.7, the results of all tensile tests are to comply with the requirements given in Table 5.7.2 appropriate to the specified minimum tensile strength.

7.4.7 Where tests are taken at a depth greater than 12,5 mm from the surface or where they are taken in a transverse direction, the mechanical properties which can be expected are to be agreed.

7.4.8 On seamless drums and headers where tests are taken from each end, the variation in tensile strength is not to exceed 70 N/mm².

7.4.9 For small batch-tested forgings, the hardness values are to comply with the requirements of Table 5.7.2 appropriate to the specified minimum tensile strength. If forgings of more than one thickness are to be supplied from one cast, then the test is to be made on the thickest forging.

7.5 Non-destructive examination

7.5.1 Non-destructive testing is to be carried out in accordance with the requirements of the approved forging drawing and specification, or as otherwise agreed between the manufacturer, purchaser and Surveyor.

Table 5.7.1 Chemical composition

Type of steel	Tensile strength N/mm ²	Chemical composition of ladle samples %								
		C max.	Si	Mn	P max.	S max.	Al	Residual elements		
Carbon- manganese	410–530	0,20	0,10–0,40	0,50–1,20	0,030	0,025	(See Notes 1 and 3)	Ni	0,40 max.	
	460–580	0,23		0,80–1,40				Cr	0,25 max.	
	490–610	0,25		0,90–1,70				Mo	0,10 max.	
								Cu	0,30 max.	
								Total 0,80 max.		
Alloy steel								Cr	Mo	
	1Cr1/2Mo	440–590	0,18	0,15–0,40	0,40–0,70	0,030	0,025	0,020 max. (See Note 2)	0,85–1,15 2,0–2,5	0,45–0,65 0,90–1,20
	2 ¹ / ₄ Cr1Mo	490–640	0,15							
NOTES										
1. Fine grained steels are to contain: aluminium (acid soluble) 0,015% min. or aluminium (total) 0,018% min.										
2. For alloy steels, aluminium (acid soluble) 0,020% max. The determination of the aluminium (total) content is acceptable provided the above value is not exceeded.										
3. Niobium may be used as a grain refiner in place of aluminium, in which case the content is to be in the range 0,01% to 0,06%.

7.6 Pressure tests

7.6.1 Where applicable, pressure tests are to be carried out in accordance with the requirements of the relevant Rules.

7.7 Mechanical properties for design purposes

7.7.1 Nominal values for the minimum lower yield or 0,2 per cent proof stress at temperatures of 50°C and higher are given in Table 5.7.3. These values are intended for design purposes only, and verification is not required except for materials complying with National or proprietary specifications where the elevated temperature properties used for design purposes are higher than those given in Table 5.7.3.

7.7.2 Where verification is required, at least one tensile test at the proposed design or other agreed temperature is to be made on each forging or each batch of forgings. The test specimen is to be taken from material adjacent to that used for tests at ambient temperature, and the test procedure is to be in accordance with the requirements of Chapter 2. The results of all tests are to comply with the requirements of the National or proprietary specification.

7.7.3 Values for the estimated average stress to rupture in 100 000 hours are given in Table 5.7.4 and may be used for design purposes.

Table 5.7.4 Mechanical properties for design purposes: estimated average values for stress to rupture in 100 000 hours (units N/mm²)

Section 8

Ferritic steel forgings for low temperature service

8.1 Scope

8.1.1 The requirements for carbon-manganese and nickel steels suitable for low temperature service are detailed in this Section. They are applicable to all forgings used for the construction of cargo tanks, storage tanks and process pressure vessels for liquefied gases and, where the design temperature is less than 0°C, to forgings for the piping systems.

8.1.2 The requirements are also applicable to forgings for other pressure vessels and pressure piping systems where the use of steels with guaranteed impact properties at low temperatures is required.

8.1.3 In all cases, details of the proposed chemical composition, heat treatment and mechanical properties are to be submitted for approval.

8.1.4 In addition to the steels in this Section, the austenitic stainless steels detailed in Section 9 may also be used for low temperature applications.

8.2 Chemical composition

8.2.1 The chemical composition of ladle samples is, in general, to comply with the requirements given in Table 5.8.1.

8.3 Heat treatment

8.3.1 Forgings are to be normalised, normalised and tempered or quenched and tempered in accordance with the approved specification.

8.4 Mechanical tests

8.4.1 At least one tensile and three Charpy V-notch impact test specimens are to be taken from each forging or each batch of forgings. Where the dimensions and shape allow, the test specimens are to be cut in a longitudinal direction.

8.4.2 The impact tests are to be carried out at a temperature appropriate to the type of steel and for the proposed application. Where forgings are intended for ships for liquefied gases, the test temperature is to be in accordance with the requirements given in Table 3.6.3 in Chapter 3.

8.4.3 The results of all tensile tests are to comply with the approved specification.

8.4.4 The average energy values for impact tests are also to comply with the approved specification and generally with the requirements of Ch 3,6. One individual value may be less than the required average value provided that it is not less than 70 per cent of this value. See Ch 2,1.4 for re-test procedures.

Steel Forgings

Chapter 5

Sections 8 & 9

Table 5.8.1 Chemical composition of ferritic steel forgings

Grade of steel	C %	Si %	Mn %	Ni %	P %	S %	Residual elements %	Grain refiners % Al	Other
LT-AH (AH40) LT-DH (DH40) LT-EH (EH40)	0,18 max.	0,50 max.	0,90–1,60	0,40 max.	0,035 max.	0,030 max.	Cu 0,35 max. Cr 0,20 max. Mo 0,08 max. Total 0,60 max.		(See Note)
LT-FH (FH40)	0,16 max.			0,80 max.	0,025 max.	0,025 max.			Nb 0,02 – 0,05 V 0,03 – 0,10 Ti 0,02 max.
1½Ni	0,18 max.	0,10 – 0,35	0,30–1,50	1,30–1,70		0,020 max.	Cu 0,35 max. Cr 0,25 max. Mo 0,08 max. Total 0,60 max.	Total 0,020 min Acid soluble 0,015 min	
3½Ni	0,15 max.		0,30–0,90	3,20–3,80					
5Ni	0,12 max.			4,70–5,30					
9 Ni	0,10 max.			8,50–10,0					

NOTE

The steel is to contain aluminium, niobium, vanadium or other suitable grain refining elements, either singly or in any combination. When used singly, the steel is to contain the specified minimum content of the grain refining element. When used in combination, the specified minimum content of each element is not applicable.

8.5 Non-destructive examination

8.5.1 Non-destructive testing is to be carried out in accordance with the requirements of the approved forging drawing and specification, or as otherwise agreed between the manufacturer, purchaser and Surveyor.

8.6 Pressure tests

8.6.1 When applicable, pressure tests are to be carried out in accordance with the requirements of the relevant Rules.

Section 9 Austenitic stainless steel forgings

9.1 General

9.1.1 Forgings in austenitic stainless steels are acceptable for use in the construction of cargo tanks, storage tanks and piping systems for chemicals and liquefied gases. They may also be accepted for elevated temperature service in boilers.

9.1.2 Where it is proposed to use forgings in these types of steels, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval. These are to comply, in general, with the requirements of Ch 3,7 for austenitic steel plates.

9.1.3 Unless otherwise agreed, impact tests are not required for acceptance purposes. Where they are required, tests are to be made on longitudinal specimens at minus 196°C and the minimum average energy requirement is to be 41J.

9.2 Mechanical properties for design purposes

9.2.1 Where austenitic stainless steel forgings are intended for service at elevated temperatures, the nominal values for the minimum one per cent proof stress at temperatures of 100°C and higher given in Table 5.9.1 may be used for design purposes. Verification of these values is not required except for material complying with a National or proprietary specification in which the elevated temperature properties proposed for design purposes are higher than those given in Table 5.9.1.

9.3 Non-destructive examination

9.3.1 Non-destructive examination is to be carried out in accordance with the requirements of the approved forging drawing and specification or as otherwise agreed between the manufacturer, purchaser and Surveyor.

9.4 Intergranular corrosion tests

9.4.1 Where corrosive conditions are anticipated in service, intergranular corrosion tests are required on forgings in Grades 304, 316 and 317. Such tests may not be required for Grades 304L, 316L, 321 and 347.

Table 5.9.1 Mechanical properties for design purposes: austenitic stainless steels

Grade	Nominal 1% proof stress (N/mm ²) at a temperature of												
	100°C	150°C	200°C	250°C	300°C	350°C	400°C	450°C	500°C	550°C	600°C	650°C	700°C
304L	168	150	137	128	122	116	110	108	106	102	100	96	93
316L	177	161	149	139	133	127	123	119	115	112	110	107	105
316LN	238	208	192	180	172	166	161	157	152	149	144	142	138
321	192	180	172	164	158	152	148	144	140	138	135	130	124
347	204	192	182	172	166	162	159	157	155	153	151	—	—

9.4.2 When an intergranular corrosion test is specified, it is to be carried out in accordance with the procedure given in Ch 2,8.1.

Steel Pipes and Tubes

Chapter 6

Section 1

Section

1	General requirements
2	Seamless pressure pipes
3	Welded pressure pipes
4	Ferritic steel pressure pipes for low temperature service
5	Austenitic stainless steel pressure pipes
6	Boiler and superheater tubes

■ Section 1 General requirements

1.1 Scope

1.1.1 This Section gives the general requirements for boiler tubes, superheater tubes and pipes intended for use in the construction of boilers, pressure vessels and pressure piping systems.

1.1.2 In addition to specifying mechanical properties for the purpose of acceptance testing, these requirements give details of appropriate mechanical properties at elevated temperatures to be used for design purposes.

1.1.3 Except for pipes for Class III pressure systems (as defined in the relevant Rules), all pipes and tubes are to be manufactured and tested in accordance with the requirements of Chapters 1 and 2, the general requirements of this Section and the appropriate specific requirements given in Sections 2, 3, 4, 5 and 6.

1.1.4 Steels intended for the piping systems for liquefied gases where the design temperature is less than 0°C are to comply with the specific requirements of Section 4 or 5.

1.1.5 As an alternative to 1.1.3 and 1.1.4, pipes or tubes which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

1.1.6 At the discretion of the Surveyor, a modified testing procedure may be adopted for small quantities of materials. In such cases, these may be accepted on the manufacturer's declared chemical composition and hardness tests or other evidence of satisfactory properties.

1.1.7 Pipes for Class III pressure systems are to be manufactured and tested in accordance with the requirements of an acceptable National specification. The manufacturer's test certificate will be acceptable and is to be provided for each consignment of material. Forge butt welded pipes are not acceptable for oil fuel systems, heating coils in oil tanks, primary refrigerant systems and other applications where the pressure exceeds 4,0 bar (4,1 kgf/cm²).

1.2 Manufacture

1.2.1 Pipes for Class I and II pressure systems, boiler and superheater tubes are to be manufactured at works approved by Lloyd's Register (hereinafter referred to as 'LR'). The steel used is to be manufactured and cast in ingot moulds or by an approved continuous casting process as detailed in Ch 3, 1.3.

1.2.2 Unless a particular method is requested by the purchaser, pipes and tubes may be manufactured by any of the following methods:

- Hot finished seamless.
- Cold finished seamless.
- Electric resistance or induction welded.
- Cold finished electric resistance or induction welded.
- Electric fusion welded.

1.2.3 Care is to be taken during manufacture that the pipe or tube surfaces coming in contact with any non-ferrous metals or their compounds are not contaminated to such an extent as could prove harmful during subsequent fabrication and operation.

1.3 Quality

1.3.1 All pipes and tubes are to have a workmanlike finish and are to be clean and free from such surface and internal defects as can be established by the specified tests.

1.3.2 All pipes and tubes are to be reasonably straight. The ends are to be cut nominally square with the axis of the pipe or tube, and are to be free from excessive burrs.

1.4 Dimensional tolerances

1.4.1 The tolerances on the wall thickness and diameter of pipes and tubes are to be in accordance with an acceptable National specification.

1.5 Chemical composition

1.5.1 The requirements for the chemical composition of ladle samples and acceptable methods of deoxidation are detailed in subsequent Sections in this Chapter.

1.6 Heat treatment

1.6.1 All pipes and tubes are to be supplied in the condition detailed in the relevant specific requirements.

Steel Pipes and Tubes

Chapter 6

Section 1

1.7 Test material

1.7.1 Pipes and tubes are to be presented for test in batches. The size of a batch and the number of tests to be performed are dependent on the application.

1.7.2 Where heat treatment has been carried out, a batch is to consist of pipes or tubes of the same size, manufactured from the same types of steel and subjected to the same finishing treatment in a continuous furnace, or heat treated in the same furnace charge in a batch type furnace.

1.7.3 Where no heat treatment has been carried out, a batch is to consist of pipes or tubes of the same size manufactured by the same method from material of the same type of steel.

1.7.4 For pipes for Class I pressure systems and boiler and superheater tubes, at least two per cent of the number of lengths in each batch is to be selected at random for the preparation of tests at ambient temperature.

1.7.5 For pipes for Class II pressure systems, each batch is to contain not more than the number of lengths given in Table 6.1.1. Tests are to be carried out on at least one pipe selected at random from each batch or part thereof.

Table 6.1.1 Batch sizes for pipes for Class II pressure systems

Outside diameter mm	Number in batch
≤323,9	200 pipes as made
>323,9	100 pipes as made

1.8 Dimensions of test specimens and test procedures

1.8.1 The procedures for mechanical tests and the dimensions of the test specimens are to be in accordance with Chapter 2.

1.9 Visual and non-destructive testing

1.9.1 All pipes for Class I and II pressure systems, boiler and superheater tubes, are to be presented for visual examination and verification of dimensions. The manufacturer is to provide adequate lighting conditions to enable an internal and external examination of the pipes and tubes to be carried out.

1.9.2 For welded pipes and tubes, the manufacturer is to employ suitable non-destructive methods for the quality control of the welds. It is preferred that this examination is carried out on a continuous basis.

1.10 Hydraulic test

1.10.1 Each pipe and tube is to be subjected to a hydraulic test at the manufacturer's works.

1.10.2 The hydraulic test pressure is to be determined from the following formula, except that the maximum test pressure need not exceed 140 bar (143 kgf/cm²):

$$P = \frac{20st}{D} \left(P = \frac{200st}{D} \right)$$

where

- P = test pressure, in bar (kgf/cm²)
- D = nominal outside diameter, in mm
- t = nominal wall thickness, in mm
- s = 80 per cent of the specified minimum yield stress, in N/mm² (kgf/mm²), for ferritic steels and 70 per cent of the specified minimum, 1,0 per cent proof stress, in N/mm² (kgf/mm²), for austenitic steels. These relate to the values specified for acceptance testing at ambient temperature.

1.10.3 The test pressure is to be maintained for sufficient time to permit proof and inspection. Unless otherwise agreed, the manufacturer's certificate of satisfactory hydraulic test will be accepted. Where it is proposed to adopt a test pressure other than that determined as in 1.10.2, the proposal will be subject to special consideration.

1.10.4 Subject to special approval, either an ultrasonic or eddy current test can be accepted in lieu of the hydraulic test.

1.11 Rectification of defects

1.11.1 Surface imperfections may be removed by grinding provided that the thickness of the pipe or tube after dressing is not less than the required minimum thickness. The dressed area is to be blended into the contour of the tube.

1.11.2 By agreement with the Surveyor, the repair of minor defects by welding can be accepted, subject to welding procedure tests which demonstrate acceptable properties appropriate for the grade of pipe to be repaired. Weld procedure tests are to be subjected to the same heat treatment as will be applied to the actual pipes after weld repair.

1.11.3 The repaired area is to be tested by magnetic particle examination, or, for austenitic steels, by liquid penetrant examination on completion of welding, heat treatment and surface grinding.

1.12 Identification

1.12.1 Pipes and tubes are to be clearly marked by the manufacturer in accordance with the requirements of Chapter 1. The following details are to be shown on all materials which have been accepted:

- (a) LR or Lloyd's Register.
- (b) Manufacturer's name or trade mark.
- (c) Identification mark for the specification or grade of steel.
- (d) Identification number and/or initials which will enable the full history of the item to be traced.
- (e) The personal stamp of the Surveyor responsible for the final inspection.

Steel Pipes and Tubes

Chapter 6

Sections 1 & 2

1.12.2 It is recommended that hard stamping be restricted to the end face, but it may be accepted in other positions in accordance with National Standards and practices.

1.13 Certification

1.13.1 The manufacturer is to provide the Surveyor with copies of the test certificate or shipping statement for all material which has been accepted.

1.13.2 Each test certificate is to contain the following particulars:

- Purchaser's name and order number.
- If known, the contract number for which the material is intended.
- Address to which material is despatched.
- Specification or the grade of material.
- Description and dimensions.
- Identification number and/or initials.
- Cast number and chemical composition of ladle samples.
- Mechanical test results, and results of the intercrystalline corrosion tests where applicable.
- Condition of supply.

1.13.3 The chemical composition stated on the certificate is to include the content of all the elements detailed in the specific requirements. Where rimming steel is supplied, this is to be stated on the certificate.

1.13.4 When steel is not produced at the pipe or tube mill, a certificate is to be supplied by the steelmaker stating the process of manufacture, the cast number and the ladle analysis.

1.13.5 The steel manufacturer's works is to be approved by LR.

Section 2 Seamless pressure pipes

2.1 Scope

2.1.1 Provision is made in this Section for seamless pressure pipes in carbon, carbon-manganese and low alloy steels.

2.1.2 Where pipes are used for the manufacture of pressure vessel shells and headers, the requirements for forgings in Ch 5,7 are applicable where the wall thickness exceeds 40 mm.

2.2 Manufacture and chemical composition

2.2.1 Pipes are to be manufactured by a seamless process and may be hot or cold finished.

2.2.2 The method of deoxidation and the chemical composition of ladle samples are to comply with the appropriate requirements given in Table 6.2.1.

Table 6.2.1 Chemical composition of seamless pressure pipes

Chemical composition of ladle samples %														
Type of steel	Grade	Method of deoxidation	C	Si	Mn	S max.	P max.	Residual elements						
Carbon and carbon-manganese	320	Semi-killed or killed	≤0,16	–	0,40—0,70	0,050	0,050	Ni 0,30 max. Cr 0,25 max. Mo 0,10 max. Cu 0,30 max. Total 0,70 max.	Cr	Mo	Cu	Sn	V	Al

Steel Pipes and Tubes

Chapter 6

Section 2

2.3 Heat treatment

2.3.1 Pipes are to be supplied in the condition given in Table 6.2.3.

2.4 Mechanical tests

2.4.1 All pipes are to be presented in batches as defined in Section 1.

2.4.2 Each pressure pipe selected for test is to be subjected to tensile and flattening or bend tests.

2.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 6.2.2.

2.5 Mechanical properties for design

2.5.1 Values for nominal minimum lower yield or 0,2 per cent proof stress at temperatures of 50°C and higher are given in Table 6.2.4 and are intended for design purposes only. Verification of these values is not required, except for materials complying with National or proprietary specification where the elevated temperature properties used for design are higher than those given in Table 6.2.4.

2.5.2 In such cases, at least one tensile test at the proposed design or other agreed temperature is to be made on each cast. The test specimen is to be taken from material adjacent to that used for tests at ambient temperature and tested in accordance with the procedures given in Chapter 2. If tubes or pipes of more than one thickness are supplied from one cast, the test is to be made on the thickest tube or pipe.

Table 6.2.3 Heat treatment

Type of steel	Condition of supply
Carbon and carbon-manganese	
Hot finished	Hot finished (see Note 1) Normalised (see Note 2)
Cold finished	Normalised (see Note 2)
Alloy steel	
1Cr1/2Mo	Normalised and tempered
2 ¹ / ₄ Cr1Mo	Grade 410 Grade 490 Fully annealed Normalised and tempered 650—780°C
	Grade 490 Normalised and tempered 650—750°C
¹ / ₂ Cr ¹ / ₂ Mo ¹ / ₄ V	Normalised and tempered
NOTES	
1. Provided that the finishing temperature is sufficiently high to soften the material.	
2. Normalised and tempered at the option of the manufacturer.	

2.5.3 As an alternative to 2.5.2, a manufacturer may carry out an agreed comprehensive test program for a stated grade of steel to demonstrate that the specified minimum mechanical properties at elevated temperatures can be consistently obtained. This test program is to be carried out under the supervision of the Surveyors, and the results submitted for assessment and approval. When a manufacturer is approved on this basis, tensile tests at elevated temperatures are not required for acceptance purposes, but at the discretion of the Surveyors occasional check tests of this type may be requested.

2.5.4 Values for the estimated average stress to rupture in 100 000 hours are given in Table 6.2.5 and may be used for design purposes.

Table 6.2.2 Mechanical properties for acceptance purposes: seamless pressure pipes (maximum wall thickness 40 mm), see 2.1.2

Type of steel	Grade	Yield stress N/mm ²	Tensile strength N/mm ²	Elongation on 5,65√S ₀ % minimum	Flattening test constant C	Bend test diameter of former (t = thickness)

Steel Pipes and Tubes

Chapter 6

Section 3

Section 3 Welded pressure pipes

3.1 Scope

3.1.1 Provision is made in this Section for welded pressure pipes in carbon, carbon-manganese and low alloy steels.

3.2 Manufacture and chemical composition

3.2.1 Pipes are to be manufactured by the electric resistance or induction welding process and, if required, may be subsequently hot reduced or cold finished.

3.2.2 Where it is proposed to use other welding processes, details of the welding processes and procedures are to be submitted for review.

3.2.3 In all cases, welding procedure tests are required. Test samples are to be subjected to the same heat treatment as the pipe.

3.2.4 The method of deoxidation and the chemical composition of ladle samples are to comply with the appropriate requirements given in Table 6.3.1.

3.3 Heat treatment

3.3.1 Pipes are to be supplied in the heat treated condition given in Table 6.3.3.

3.4 Mechanical tests

3.4.1 All pipes are to be presented in batches as defined in Section 1.

3.4.2 Each pressure pipe selected for test is to be subjected to tensile and flattening or bend tests.

3.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 6.3.2.

3.5 Mechanical properties for design

3.5.1 The mechanical properties at elevated temperature for carbon and carbon-manganese steels in Grades 320 to 460 and 1Cr¹/₂Mo steel can be taken from the appropriate Tables in Section 2.

Table 6.3.1 Chemical composition of welded pressure pipes

Type of steel	Grade	Method of deoxidation	Chemical composition of ladle samples %													
			C	Si	Mn	S max.	P max.	Residual elements								
Carbon and carbon-manganese	320	Any method (see Note)	≤0,16	—	0,30—0,70	0,050	0,050	Ni	0,30 max.							
	≤0,17		≤0,35	0,40—1,00	0,045	0,045	Cr	0,25 max.								
	410	Killed	≤0,21	≤0,35	0,40—1,20	0,045	0,045	Mo	0,10 max.							
	460		≤0,22	≤0,35	0,80—1,40	0,045	0,045	Cu	0,30 max.

	410	235	410 – 530	22	0,08
	460	265	460 – 580	21	0,07
1Cr ¹ / ₂ Mo	440	275	440 – 590	22	0,07

Table 6.3.3 Heat treatment: welded pressure pipes

Type of steel	Condition of supply
Carbon and carbon-manganese, see Note	Normalised (Normalised and tempered at the option of the manufacturer)
1Cr ¹ / ₂ Mo	Normalised and tempered
NOTE Subject to special approval, electric resistance welded (ERW) pipes and tubes in grades 320 and 360 may be supplied without heat treatment for the following applications: (a) Class 2 piping systems, except for liquefied gases or other low temperature applications. (b) Class 3 piping systems.	

4.2.4 The method of deoxidation and the chemical composition of ladle samples are to comply with the appropriate requirements given in Table 6.4.1.

4.3 Heat treatment

4.3.1 Pipes are to be supplied in the condition given in Table 6.4.3.

4.4 Mechanical tests

4.4.1 All pipes are to be presented for test in batches as defined in Section 1 for Class 1 pressure piping systems, but in addition the material in each batch is to be from the same cast.

4.4.2 At least two per cent of the number of lengths in each batch is to be selected at random for the preparation of tests.

4.4.3 Each pressure pipe selected for test is to be subjected to tensile, flattening or bend test at room temperature and, where the wall thickness is 6 mm or greater, an impact test at the test temperature specified in Table 6.4.2.

4.4.4 The impact tests are to consist of a set of three Charpy V-notch test specimens cut in the longitudinal direction with the notch perpendicular to the original surface of the pipe. The dimensions of the test specimens are to be in accordance with the requirements of Chapter 2.

4.4.5 The results of all tensile, flattening and bend tests are to comply with the appropriate values in Table 6.4.2.

4.4.6 The average value for impact test specimens is to comply with the appropriate requirements of Table 6.4.2. One individual value may be less than the required average value provided that it is not less than 70 per cent of this value. See Ch 2, 1.4.1 for re-test procedures.

Section 4 Ferritic steel pressure pipes for low temperature service

4.1 Scope

4.1.1 Provision is made in this Section for carbon, carbon-manganese and nickel pipes intended for use in the piping arrangements for liquefied gases where the design temperature is less than 0°C. These requirements are also applicable for other types of pressure piping systems where the use of steels with guaranteed impact properties at low temperatures is required.

4.2 Manufacture and chemical composition

4.2.1 Carbon and carbon-manganese steel pipes are to be manufactured by a seamless, electric resistance or induction welding process.

4.2.2 Nickel steel pipes are to be manufactured by a seamless process.

4.2.3 Seamless pipes may be hot finished or cold finished. Welded pipes may be as-welded, hot finished or cold finished. The terms 'hot finished', 'cold finished' and 'as-welded' apply to the condition of the pipes before final heat treatment.

Steel Pipes and Tubes

Chapter 6

Section 4

Table 6.4.1 Chemical composition

Type of steel	Grade	Method of deoxidation	Chemical composition of ladle sample %							
			C max.	Si	Mn	P max.	S max.	Ni	Al _{sol} see Note	Residual elements
Carbon	360	Fully killed	0,17	0,10—0,35	0,40—1,00	0,030	0,025	—	0,015 min.	Cr 0,25 Cu 0,30 Mo 0,10 Ni 0,30 Total 0,70
Carbon-manganese	410 and 460		0,20	0,10—0,35	0,60—1,40	0,030	0,025	—	0,015 min.	
3 ¹ / ₂ Ni	440		0,15	0,15—0,35	0,30—0,90	0,025	0,020	3,25—3,75	—	Cr 0,25 Cu 0,30 Mo 0,10
9Ni	690		0,13	0,15—0,30	0,30—0,90	0,025	0,020	8,50—9,50	—	Total 0,60

NOTE
Where a minimum Al_{sol} of 0,015% is specified, the determination of the total aluminium is acceptable provided that the result is not less than 0,020%.

Table 6.4.2 Mechanical properties for acceptance purposes

Type of steel	Grade	Yield stress N/mm ²	Tensile strength N/mm ²	Elongation on $5,65\sqrt{S_0}$ % minimum	Flattening test constant C	Bend test diameter of former (t = thickness)	Charpy V-notch impact tests	
							Test temperature °C	Average energy J minimum
Carbon	360	210	360—480	24	0,10	4t	−40	27
Carbon-manganese	410 460	235 260	410—530 460—580	22 21	0,08 0,07	4t	−50	27
3 ¹ / ₂ Ni	440	245	440—590	16	0,08	4t	−95	34
9Ni	690	510	690—840	15	0,08	4t	−196	41

For standard subsidiary impact test specimens, the minimum energy values are to be as follows:

Required average energy value for standard 10 mm x 10 mm	Subsidiary 10 mm x 7,5 mm	Subsidiary 10 mm x 5 mm
	Average energy	Average energy
27 J	22 J	18 J
34 J	28 J	23 J
41 J	34 J	27 J

Steel Pipes and Tubes

Chapter 6

Section 5

Section 5 Austenitic stainless steel pressure pipes

5.1 Scope

5.1.1 Provision is made in this Section for austenitic stainless steel pipes suitable for use in the construction of the piping systems for chemicals and for liquefied gases where the design temperature is not less than minus 165°C and for bulk chemical tankers.

5.1.2 Austenitic stainless steels are also suitable for service at elevated temperatures. Where such applications are proposed, details of the chemical composition, heat treatment and mechanical properties are to be submitted for consideration and approval.

5.1.3 Where it is intended to supply seamless pipes in the direct quenched condition, a programme of tests for approval is to be carried out under the supervision of the Surveyors, and the results are to be to the satisfaction of LR, see Ch 1,2.2.

5.2 Manufacture and chemical composition

5.2.1 Pipes are to be manufactured by a seamless or a continuous automatic electric fusion welding process.

5.2.2 Welding is to be in a longitudinal direction, with or without the addition of filler metal.

5.2.3 The chemical composition of the ladle samples is to comply with the appropriate requirements of Table 6.5.1.

5.3 Heat treatment

5.3.1 Pipes are generally to be supplied by the manufacturer in the solution treated condition over their full length.

5.3.2 Alternatively, seamless pipes may be direct quenched immediately after hot forming, while the temperature of the pipes is not less than the specified minimum solution treatment temperature.

5.4 Mechanical tests

5.4.1 All pipes are to be presented in batches as defined in Section 1 for Class I and II piping systems.

5.4.2 Each pipe selected for test is to be subjected to tensile and flattening or bend tests.

5.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 6.5.2.

Table 6.5.1 Chemical composition

Type of steel	Grade	Chemical composition of ladle sample %								
		C max.	Si	Mn	P max.	S max.	Cr	Mo	Ni	Others

347	510	0,08	<1,00	<2,00	0,045	0,030	17,0 – 19,0	—	9,0 – 13,0	Nb ≥10 x C ≤1,00

Table 6.5.2 Mechanical properties for acceptance purposes

Type of steel	Grade	0,2% proof stress N/mm ² (see Note)	1,0% proof stress N/mm ²	Tensile strength N/mm ²	Elongation on 5,65√S ₀ % minimum	Flattening test constant C	Bend test diameter of former (t = thickness)
304L	490	175	205	490 – 690	30	0,09	3t
316L	490	185	215	490 – 690	30	0,09	3t
321	510	195	235	510 – 710	30	0,09	3t
347	510	205	245	510 – 710	30	0,09	3t
NOTE The 0,2% proof stress values given for information purposes and unless otherwise agreed are not required to be verified by test.							

Steel Pipes and Tubes

Chapter 6

Sections 5 & 6

5.5 Intergranular corrosion tests

5.5.1 For materials used for piping systems for chemicals, intercrystalline corrosion tests are to be carried out on one per cent of the number of pipes in each batch, with a minimum of one pipe.

5.5.2 For pipes with an outside diameter not exceeding 40 mm, the test specimens are to consist of a full cross-section. For larger pipes, the test specimens are to be cut as circumferential strips of full wall thickness and having a width of not less than 12,5 mm. In both cases, the total surface area is to be between 15 and 35 cm².

5.5.3 Unless otherwise agreed or required for a particular chemical cargo, the testing procedure is to be in accordance with Ch 2,8.

5.5.4 After immersion, the full cross-section test specimens are to be subjected to a flattening test in accordance with the requirements of Chapter 2. The strip test specimens are to be subjected to a bend test through 90° over a mandrel of diameter equal to twice the thickness of the test specimen.

5.6 Fabricated pipework

5.6.1 Fabricated pipework is to be produced from material manufactured in accordance with 5.2, 5.3, 5.4 and 5.5.

5.6.2 Welding is to be carried out in accordance with an approved and qualified procedure by suitably qualified welders.

5.6.3 Fabricated pipework may be supplied in the as-welded condition without subsequent solution treatment provided that welding procedure tests have demonstrated satisfactory material properties including resistance to intercrystalline corrosion.

5.6.4 In addition, butt welds are to be subjected to 5 per cent radiographic examination for Class I, and 2 per cent for Class II pipes.

5.6.5 Fabricated pipework in the as-welded condition and intended for systems located on deck is to be protected by a suitable corrosion control coating.

6.1.2 Austenitic stainless steels may also be used for this type of service. Where such applications are proposed, details of the chemical composition, heat treatment and mechanical properties are to be submitted for consideration and approval.

6.2 Manufacture and chemical composition

6.2.1 Tubes are to be seamless or welded and are to be manufactured in accordance with the requirements of Sections 2 and 3, respectively.

6.2.2 The method of deoxidation and the chemical composition of ladle samples are to comply with the requirements given in Table 6.2.1 or 6.3.1, as appropriate.

6.3 Heat treatment

6.3.1 All tubes are to be supplied in accordance with the requirements given in Table 6.2.3 or 6.3.3 as appropriate, except that 1Cr¹/₂Mo steel may be supplied in the normalised only condition when the carbon content does not exceed 0,15 per cent.

6.4 Mechanical tests

6.4.1 Tubes are to be presented for test in batches as defined in Section 1.

6.4.2 Each boiler and superheater tube selected for test is to be subjected to at least the following:

- (a) Tensile test.
- (b) Flattening or bending test.
- (c) Expanding or flanging test.

6.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 6.6.1.

6.5 Mechanical properties for design

6.5.1 The mechanical properties at elevated temperature for carbon and carbon-manganese steels in Grades 320 to 460, 1Cr¹/₂Mo and 2¹/₄Cr1Mo steels can be taken from the appropriate Tables in Section 2.

6.5.2 Where rimming steel is used, the design temperature is limited to 400°C.

■ Section 6 Boiler and superheater tubes

6.1 Scope

6.1.1 Provision is made in this Section for boiler and superheater tubes in carbon, carbon-manganese and low alloy steels.

■ Section 1 General requirements

1.1 Scope

1.1.1 This Section gives the general requirements for both grey (flake) and spheroidal (nodular) graphite iron castings intended for use in the construction of ships, other marine structures, machinery, boilers, pressure vessels and piping systems.

1.1.2 Where required by the relevant Rules dealing with design and construction, castings are to be manufactured and tested in accordance with Chapters 1 and 2, together with the requirements given in this Section and either Section 2 for grey iron castings or Section 3 for spheroidal graphite iron castings. Castings for crankshafts are additionally to comply with the requirements detailed in Section 4.

1.1.3 As an alternative to 1.1.2, castings which comply with National or proprietary specifications may be accepted, provided that these specifications give reasonable equivalence to the requirements of this Chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

1.1.4 Where small castings are produced in large quantities, or where castings of the same type are produced in regular quantities, alternative survey procedures, in accordance with Ch 1.2.2, may be adopted subject to approval by Lloyd's Register (hereinafter referred to as 'LR').

1.2 Manufacture

1.2.1 Castings as designated in 1.1.2 are to be made at foundries approved by LR.

1.2.2 Suitable mechanical methods are to be employed for the removal of surplus material from castings. Thermal cutting processes are not acceptable, except as a preliminary operation to mechanical methods.

1.3 Quality of castings

1.3.1 Castings are to be free from surface or internal defects which would be prejudicial to their proper application in service. The surface finish is to be in accordance with good practice and any specific requirements of the approved plan.

1.4 Chemical composition

1.4.1 The chemical composition of the iron used is left to the discretion of the manufacturer, who is to ensure that it is suitable to obtain the mechanical properties specified for the castings.

1.5 Heat treatment

1.5.1 Except as required by 1.5.2, castings may be supplied in either the as cast or heat treated condition.

1.5.2 For some applications, such as elevated temperature service, or where dimensional stability is important, castings may require to be given a suitable tempering or stress relieving heat treatment. This is to be carried out after any refining heat treatment and before machining.

1.5.3 Where spheroidal graphite iron castings are to be impact tested they should be suitably ferritised, see 3.3.2.

1.5.4 Where it is proposed to carry out local hardening of the surface of a casting, full details of the proposed procedure are to be submitted for approval.

1.6 Test material

1.6.1 At least one test sample is to be provided for each casting or batch of castings. For large castings, where more than one ladle of metal is used, one test sample is to be provided, from each ladle used.

1.6.2 A batch testing procedure may be adopted for castings with a fettled mass of 1 tonne or less. All castings in a batch are to be of similar type and dimensions, and cast from the same ladle of metal. One test sample is to be provided for each multiple of two tonnes of fettled castings in the batch.

1.6.3 Where separately cast test samples are used, they are to be cast in moulds made from the same type of material as used for the castings and are not to be stripped from the moulds until the temperature is below 500°C.

1.6.4 All test samples are to be suitably marked to identify them with the castings which they represent.

1.6.5 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent.

1.7 Mechanical tests

1.7.1 One tensile specimen is to be prepared from each test sample. The dimensions of the test specimens and the testing procedures used are to be in accordance with Chapter 2.

Iron Castings

Chapter 7

Sections 1 & 2

1.7.2 The results of all tensile tests are to comply with the requirements given in Section 2, 3 or 4, as appropriate.

1.7.3 In the case of castings supplied in the as cast condition which initially do not meet the requirements of 1.7.2, the manufacturer, by agreement with the purchaser, has the right to heat treat the castings, together with the representative test samples, and re-submit them for acceptance.

1.7.4 In the case of a batch of castings supplied in the heat treated condition which initially do not meet the requirements of 1.7.2, the manufacturer has the right to re-heat treat the batch together with the representative test samples, and re-submit the castings for acceptance. The number of reheat treatments and retests will be restricted to two.

1.8 Visual and non-destructive examination

1.8.1 All castings are to be cleaned and adequately prepared for examination. The surfaces are not to be hammered, peened or treated in any way which may obscure defects.

1.8.2 The accuracy and verification of dimensions are the responsibility of the manufacturer, unless otherwise agreed.

1.8.3 All castings are to be presented to the Surveyor for visual examination and this is to include the examination of internal surfaces where applicable.

1.8.4 The non-destructive examination of castings is not required unless otherwise stated in the approved plan or where there is reason to suspect the soundness of the casting.

1.8.5 In the event of any casting proving defective during subsequent machining or testing it is to be rejected notwithstanding any previous certification.

1.9 Rectification of defective castings

1.9.1 At the discretion of the Surveyor, small surface blemishes may be removed by local grinding.

1.9.2 Subject to the prior approval of the Surveyor, castings containing local porosity may be rectified by vacuum impregnation with a suitable plastic filler, provided that the extent of the porosity is such that it does not adversely affect the strength of the casting.

1.9.3 Repairs by welding are generally not permitted, but may be considered in special circumstances. In such cases, full details of the proposed repair procedure are to be submitted for approval prior to the commencement of the proposed rectification.

1.10 Pressure testing

1.10.1 When required by the relevant Rules, castings are to be pressure tested before final acceptance. These tests are to be carried out in the presence and to the satisfaction of the Surveyor.

1.11 Identification of castings

1.11.1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original cast, and the Surveyor is to be given full facilities for tracing the castings when required.

1.11.2 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked by the manufacturer with the following particulars:

- (a) Type and grade of cast iron.
- (b) Identification number, cast number or other marking which will enable the full history of the casting to be traced.
- (c) Manufacturer's name or trade mark.
- (d) LR or Lloyd's Register and the abbreviated name of LR's local office.
- (e) Personal stamp of Surveyor responsible for inspection.
- (f) Test pressure, where applicable.
- (g) Date of final inspection.

1.11.3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

1.12 Certification

1.12.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which has been accepted:

- (a) Purchaser's name and order number.
- (b) Description of castings and quality of cast iron.
- (c) Identification number.
- (d) General details of heat treatment, where applicable.
- (e) Results of mechanical tests.
- (f) Test pressure, where applicable.
- (g) When specially required, the chemical analysis of ladle samples.

Section 2 Grey iron castings

2.1 Scope

2.1.1 This Section gives the specific requirements for grey cast iron castings.

Iron Castings

Chapter 7

Sections 2 & 3

2.2 Test material

2.2.1 Separately cast test samples in the form of cylindrical bars, 30 mm diameter and of a suitable length, are to be used unless otherwise agreed by LR. Test samples of other dimensions may be specially required for some components as may cast-on samples. In these circumstances, the tensile strength requirements are to be agreed.

2.2.2 When two or more test samples are cast simultaneously in a single mould, the bars are to be at least 50 mm apart.

2.2.3 Test samples may be cast integrally when a casting is both more than 20 mm thick and its mass exceeds 200 kg, subject to agreement between the manufacturer and the purchaser. The type and location of the samples are to be such as to provide approximately the same cooling conditions as for the casting it represents and are also subject to agreement.

2.2.4 For continuous melting of the same grade of cast iron in large tonnages the mass of a batch may be taken as the output of two hours of pouring.

2.2.5 Where 2.2.4 applies and production is carefully monitored by systematic checking of the melting process by, for example, chill testing, chemical analysis or thermal analysis, test samples may be taken at longer intervals as agreed by the Surveyor.

2.3 Mechanical tests

2.3.1 Only the tensile strength is to be determined, and the results obtained from tests are to comply with the minimum value specified for the castings being supplied. Except for crankshaft castings (see Section 4), the specified tensile strength is to be not less than 200 N/mm² and not more than 450 N/mm². The fractured surfaces of all tensile test specimens are to be granular and entirely grey in appearance.

Section 3 Spheroidal or nodular graphite iron castings

3.1 Scope

3.1.1 This Section gives the specific requirements for spheroidal or nodular graphite iron castings.

3.1.2 These requirements are generally applicable to castings intended for use at ambient temperatures. Additional requirements will be necessary when the castings are intended for service at either low or elevated temperatures. Impact test requirements are given for low temperature service in 3.3.2.

3.2 Test material

3.2.1 The test samples are to be as detailed in Figs. 7.3.1 or 7.3.2. The dimensions of the test specimens and testing procedures used are to be in accordance with Chapter 2. Test samples of other dimensions may be specially required for some castings and these are to be agreed with the Surveyor.

Fig. 7.3.1 U-type test samples

Fig. 7.3.2 Y-type test samples

3.2.2 The test samples may be either gated to the casting or separately cast.

3.2.3 Where separately cast test samples are used, they are to be taken towards the end of pouring of the castings.

Iron Castings

Chapter 7

Section 3

3.3 Mechanical tests

3.3.1 The tensile strength and elongation are to be determined and are to comply with the requirements of Table 7.3.1. Minimum values for the 0,2 per cent proof stress are also included in this Table but are to be determined only if included in the specification. Typical ranges of hardness values are also given in Table 7.3.1 and are intended for information purposes.

3.3.2 Impact tests may be required for some applications in which case the selection of the grade is to be confined to those listed in Table 7.3.2. These castings are to be given a ferritising heat treatment. The mechanical test results are to comply with Table 7.3.2.

3.4 Metallographic examination

3.4.1 Samples for metallographic examination are to be prepared for spheroidal or nodular graphite iron castings. These samples are to be representative of each ladle used and may conveniently be taken from the tensile test specimens. Alternative arrangements for the provision of these samples may, however, be adopted subject to the concurrence of the Surveyor. They are, however, to be taken towards the end of the pour.

3.4.2 Examination of the samples is to show that at least 90 per cent of the graphite is in a dispersed spheroidal or nodular form. Details of typical matrix structures are given in Table 7.3.1 and are intended for information purposes.

Table 7.3.1 Mechanical properties for acceptance purposes: spheroidal or nodular graphite iron castings

Specified minimum tensile strength N/mm ²	0,2% proof stress (see Note) N/mm ² minimum	Elongation on $5,65 \sqrt{S_0}$ % minimum	Typical hardness value HB (see 3.3.1)	Typical structure of matrix (see 3.4.1)
370	230	17	120 – 180	Ferrite
400	250	12	140 – 200	Ferrite
500	320	7	170 – 240	Ferrite/pearlite
600	370	3	190 – 270	Pearlite/ferrite
700	420	2	230 – 300	Pearlite
800	480	2	250 – 350	Pearlite or tempered structure
NOTE If required, intermediate values may be calculated by linear interpolation.				

Table 7.3.2 Mechanical properties: impact tested grades

Specified minimum tensile strength N/mm ²	0,2% proof stress minimum (See Note 1) N/mm ²	Elongation on $5,65 \sqrt{S_0}$ minimum %	Typical hardness value	Charpy V-notch impact tests	
				Test temperature °C (See Note 2)	Average energy J minimum
350	220	22	110 – 170	20 –40	17 12
400	250	18	140 – 200	20 –20	14 12
NOTES 1. Proof stresses need only be determined if included in the specification. 2. Tests need only be made at either of the temperatures listed, as appropriate.					

■ Section 4 Iron castings for crankshafts

4.1 Scope

4.1.1 This Section gives additional requirements for cast iron crankshafts intended for diesel engines and compressors. For both of these applications, details of the proposed specification are to be submitted for approval.

4.1.2 Crankshaft castings in grey iron are acceptable only for compressors, and the specified minimum tensile strength is to be not less than 300 N/mm².

4.1.3 For crankshaft castings in spheroidal or nodular graphite iron, the specified minimum tensile strength is to be not less than 370 N/mm².

4.2 Manufacture

4.2.1 Details of the method of manufacture, including the arrangements proposed for the provision of test material, are to be submitted for approval.

4.2.2 Tests to demonstrate the soundness of prototype castings and the mechanical properties at important locations will be required.

4.3 Heat treatment

4.3.1 In general, crankshaft castings other than those which are fully annealed, normalised or oil quenched and tempered, are to receive a suitable stress relief heat treatment before machining.

4.3.2 Where it is proposed to harden the surfaces of machined pins and/or journals of cast iron crankshafts, details of the process are to be submitted for approval. Before such a process is applied to a crankshaft it is to be demonstrated by procedure tests, and to the satisfaction of the Surveyor, that the process is suitably controlled and does not impair the strength or soundness of the material.

4.4 Test material

4.4.1 Unless otherwise approved, the dimensions of the test samples are to be such as to ensure that they have mechanical properties representative of those of the average section of the crankshaft casting.

4.4.2 For large crankshaft castings, the test samples are to be cast integral with, or gated from, each casting.

4.4.3 The batch testing procedure detailed in 1.6.2 may be adopted only where small and identical crankshaft castings are produced in quantity. Generally, the fettled mass of each casting in a batch is not to exceed 100 kg, and in addition to tensile tests, the hardness of each casting is to be determined. For this purpose, a small flat is to be ground on each crankshaft, and Brinell hardness tests are to be carried out. The results obtained from these tests are to comply with the approved specification.

4.5 Non-destructive examination

4.5.1 Cast crankshafts are to be subjected to a full magnetic particle or dye penetrant examination after final machining and completion of any surface hardening operations.

4.5.2 Particular attention is to be given to the testing of the pins, journals and associated fillet radii.

4.5.3 Cracks and crack-like defects are not acceptable. Fillet radii are to be free from any indications.

4.6 Rectification of defective castings

4.6.1 Cast iron crankshafts are not to be repaired by welding, and blemishes are not to be plugged with a filler.

4.7 Certification

4.7.1 The chemical composition of ladle samples is to be given in addition to the other particulars detailed in 1.12.1.

Aluminium Alloys

Chapter 8

Section 1

Section

- 1 **Plates, bars and sections**
- 2 **Aluminium alloy rivets**
- 3 **Aluminium alloy castings**
- 4 **Aluminium/steel transition joints**

Section 1 Plates, bars and sections

1.1 Scope

1.1.1 This Section makes provision for aluminium alloy plates, bars and sections intended for use in the construction of ships and other marine structures and for cryogenic applications.

1.1.2 Except as provided in 1.1.3, all items are to be manufactured and tested in accordance with the appropriate requirements of Chapters 1 and 2 and those detailed in this Section.

1.1.3 Plates less than 3,0 mm thick and sections less than 40 mm x 40 mm x 3,0 mm may be manufactured and tested in accordance with the requirements of an acceptable National specification.

1.1.4 Materials intended for the construction of cargo tanks or storage for liquefied gases, and for other low temperature applications, are to be manufactured in the 5083 alloy in the annealed condition.

1.1.5 As an alternative to 1.1.2 and 1.1.4, materials which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section and are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

1.2 Manufacture

1.2.1 Aluminium alloys are to be manufactured at works approved by Lloyd's Register (hereinafter referred to as 'LR').

1.2.2 The alloys may be cast either in ingot moulds or by an approved continuous casting process. Plates are to be formed by rolling and may be hot or cold finished. Bars and sections may be formed by extrusion, rolling or drawing.

1.2.3 All melts are to be suitably degassed prior to casting such that the aim hydrogen content is less than 0,2 ml per 100 g.

1.3 Quality of materials

1.3.1 Materials are to be free from surface or internal defects of such a nature as would be harmful in service.

1.3.2 The manufacturer is to verify the integrity of pressure welds of closed extrusion profiles in accordance with 1.10.

1.4 Dimensional tolerances

1.4.1 Underthickness tolerances for rolled products for marine construction are given in Table 8.1.1.

Table 8.1.1 Underthickness tolerances for rolled products for marine construction

Nominal thickness range, mm	Underthickness tolerance for nominal width range, mm		
	≤1500	>1500 ≤2000	>2000 ≤3500
≥3,0 <4,0	0,10	0,15	0,15
≥4,0 <8,0	0,20	0,20	0,25
≥8,0 <12	0,25	0,25	0,25
≥12 <20	0,35	0,40	0,50
≥20 <50	0,45	0,50	0,65

1.4.2 Underthickness tolerances for extruded products for marine construction are given in Table 8.1.2.

Table 8.1.2 Underthickness tolerances for extrusions for marine construction

Nominal thickness range, mm	Open profiles, sections circumscribed by a circle of diameter, mm			Closed profiles
	≤250	>250 ≤400	>400	
≥3,0 <6,0	0,25	0,35	0,40	0,25
≥6,0 <50	0,30	0,40	0,45	0,30

1.4.3 There are to be no underthickness tolerances for materials for application in cryogenic process pressure vessels.

1.4.4 Dimensional tolerances other than permitted underthicknesses are to comply with an acceptable National or International Standard.

Aluminium Alloys

Chapter 8

Section 1

1.5 Chemical composition

1.5.1 Samples for chemical analysis are to be taken representative of each cast, or the equivalent where a continuous melting process is involved.

1.5.2 The chemical composition of these samples is to comply with the requirements of Table 8.1.3.

1.6 Heat treatment

1.6.1 The Aluminium 5000 series alloys, capable of being strain hardened, are to be supplied in any of the following temper conditions:

O	annealed
H111	annealed with slight strain hardening
H112	strain hardened from working at elevated temperatures
H116	strain hardened and with specified resistance to exfoliation corrosion for alloys where the magnesium content is 4 per cent or more
H321	strain hardened and stabilised.

1.6.2 The H116 temper is specially developed for use in a marine environment.

1.6.3 The Aluminium 6000 series alloys, capable of being age hardened, are to be supplied in either of the following temper conditions:

T5	hot worked and artificially aged
T6	solution treated and artificially aged.

1.7 Test material

1.7.1 Materials of the same product form, (i.e. plates, sections or bars) and thickness and from a single cast or equivalent, are to be presented for test in batches of not more than 2 tonnes, with the exceptions of those given in 1.7.2, 1.7.3 and 1.7.4.

1.7.2 For single plates or coils weighing more than 2 tonnes, only one tensile specimen per plate or coil is to be taken.

1.7.3 A tensile test specimen is required from each plate to be used in the construction of cargo tanks, secondary barriers and process pressure vessels with design temperatures below -55°C .

1.7.4 Extrusions, bars and sections of less than 1 kg/m in nominal weight are to be tested in batches of 1 tonne. Where the nominal weight is greater than 5 kg/m, one tensile test is to be carried out for every three tonnes produced, or fractions thereof.

1.7.5 If the material is supplied in the heat treated condition, each batch is to be treated in the same furnace charge or subjected to the same finishing treatment when a continuous furnace is used.

1.7.6 For plates over 300 mm in width, tensile test specimens are to be cut with their length transverse to the principal direction of rolling. For narrow plates and for sections and bars, the test specimens are to be cut in the longitudinal direction. Longitudinal tensile test specimens are accepted for the strain hardenable 5000 series alloys.

Table 8.1.3 Chemical composition, percentage

Element	5083	5383	5059	5086	5754	5456	6005-A (see Note 1)	6061 (see Note 1)	6082
Copper	0,10 max.	0,10 max.	0,25 max.	0,10 max.	0,10 max.	0,10 max.	0,30 max.	0,15—0,40	0,10 max.

6061-T5/T6		240	290		10
6082-T5/T6		240	280		8
NOTES					
1. 10% for thickness up to and including 6,0 mm.					
2. 8% for thickness up to and including 6,0 mm.					
3. Yield strength minimum 260 N/mm ² and tensile strength minimum 360 N/mm ² for thickness exceeding 20 mm.					

1.7.7 Longitudinal tensile test specimens from a plate are to be taken at $1/3$ width from the longitudinal edge. Longitudinal tensile test specimens taken from extruded sections should be taken in the range from $1/3$ to $1/2$ of the distance from the edge to the centre of the thickest region of the section.

1.8 Mechanical tests

1.8.1 At least one tensile test specimen is to be prepared from each batch of material submitted for acceptance.

1.8.2 Tensile test specimens are to be machined to the dimensions given in Fig. 2.2.3 in Chapter 2. Alternatively, machined proportional test specimens of circular cross-section in accordance with Fig. 2.2.2 in Chapter 2 may be used provided that the diameter is not less than 10 mm. Round bars may be tested in full section, or test specimens may be machined in accordance with the dimensions given in Fig. 2.2.2 in Chapter 2.

1.8.3 The results of all tensile tests are to comply with the values given in Tables 8.1.4 to 8.1.6, as applicable.

Table 8.1.5 Minimum mechanical properties for acceptance purposes of selected open profile extruded aluminium alloys

Alloy and temper condition	0,2% proof stress N/mm ²	Tensile strength N/mm ²	Elongation on $5,65 \sqrt{S_0}$ %
6005A-T5/T6	215	260	6
6061-T5/T6	240	260	8
6082-T5/T6	260	310	8
NOTE Values cover thicknesses up to and including 50 mm; thickness above 50 mm will be subject to special consideration.			

Table 8.1.6 Minimum mechanical properties for acceptance purposes of selected closed profile extruded aluminium alloys

Alloy and temper condition	0,2% proof stress N/mm ²	Tensile strength N/mm ²	Elongation on 5,65√S ₀ %
6005A-T5/T6	215	250	5
6061-T5/T6	205	245	4
6082-T5/T6	240	290	5
NOTE Values cover thicknesses up to and including 50 mm; thickness above 50 mm will be subject to special consideration.			

1.9 Corrosion tests

1.9.1 Rolled 5000 series alloys of type 5083, 5383, 5059, 5456 and 5086 in the H116 and H321 tempers intended for use in marine hull construction or in marine applications with frequent direct contact with seawater are to be corrosion tested with respect to exfoliation and intergranular corrosion resistance.

1.9.2 The manufacturer is to establish the relationship between microstructure and resistance to corrosion when the above alloys are approved. A reference photomicrograph taken at 500x, is to be prepared for each of the alloy-tempers and thickness ranges relevant. The reference photographs are to be taken from samples which have exhibited no evidence of exfoliation corrosion and a pitting rating of PB or better, when subjected to the test described in ASTM G66 (ASSET). The samples are also to have exhibited resistance to intergranular corrosion at a mass loss no greater than 15 mg/cm², when subjected to the test described in ASTM G67. Upon satisfactory establishment of the relationship between microstructure and resistance to corrosion, the master photomicrographs and the results of the corrosion tests are to be approved by LR. Production practices are not to be changed after approval of the reference micrographs. For batch acceptance of 5000 series alloys in the H116 and H321 tempers for use in direct contact with seawater, metallographic examination of one sample selected from mid width at one end of a randomly selected plate is to be carried out. The microstructure of the sample is to be compared to an approved reference photomicrograph of acceptable material in the presence of the Surveyor. A longitudinal section perpendicular to the rolled surface shall be prepared for metallographic examination. If the microstructure shows evidence of continuous grain boundary networks of aluminium-magnesium precipitate in excess of the approved reference photomicrographs, the batch is either to be rejected or tested for exfoliation corrosion resistance and intergranular corrosion resistance subject to the agreement of the Surveyor. The corrosion tests are to be in accordance with ASTM G66 and G67 or equivalent standards.

1.9.3 For batch acceptance of 5000 series alloys in the H116 and H321 tempers, metallographic examination of one sample selected from mid width at one end of a coil or random sheet or plate is to be carried out. The microstructure of the sample is to be compared to the reference photomicrograph of acceptable material in the presence of the Surveyor. A longitudinal section perpendicular to the rolled surface is to be prepared for metallographic examination. If the microstructure shows evidence of continuous grain boundary network of aluminium-magnesium precipitate in excess of the reference photomicrographs of acceptable material, the batch is either to be rejected or tested for exfoliation corrosion resistance and intergranular corrosion resistance subject to the agreement of the Surveyor. The corrosion tests are to be in accordance with ASTM G66 and G67 or equivalent standards. If the results from testing satisfy the acceptance criteria stated in 1.9.2 the batch is accepted, otherwise it is to be rejected.

1.9.4 As an alternative to metallographic examination, each batch may be tested for exfoliation corrosion resistance and intergranular corrosion resistance, in accordance with ASTM G66 and G67 or equivalent standards.

1.9.5 Tempers that are corrosion tested in accordance with 1.9.3 are to be marked 'M' after the temper condition, e.g. 5083 H321 M.

1.10 Pressure weld tests

1.10.1 The integrity of pressure welds of closed profile extrusions is to be verified by examination of macrosections or drift expansion tests.

1.10.2 Every closed profile extrusion is to be sampled, except where the closed profile extrusions are equal to or shorter than 6,0 m long, in which case a batch is to comprise five profiles. Every sample is to be tested at both ends.

1.10.3 Where verification is by examination of macrosections, no indication of lack of fusion is permitted.

1.10.4 Where verification of fusion at pressure welds of closed profile extrusions is by drift expansion test, testing is to be generally in accordance with Ch 2,4.3. The minimum included angle of the mandrel is to be 60°, and the minimum specimen length, 50 mm. For acceptance, there is to be no failure by a clean split along the weld line.

1.11 Visual and non-destructive examination

1.11.1 Surface inspection and verification of dimensions are the responsibility of the manufacturer, and acceptance by the Surveyors of material later found to be defective shall not absolve the manufacturer from this responsibility.

1.11.2 In general, the non-destructive examination of materials is not required for acceptance purposes. Manufacturers are expected, however, to employ suitable methods of non-destructive examination for the general maintenance of quality standards.

Aluminium Alloys

Chapter 8

Sections 1 & 2

1.11.3 For applications where the non-destructive examination of materials is considered to be necessary, the extent of this examination, together with appropriate acceptance standards, are to be agreed between the purchaser, manufacturer and Surveyor.

1.12 Rectification of defects

1.12.1 Slight surface imperfections may be removed by mechanical means, provided that the prior agreement of the Surveyor is obtained, that the work is carried out to his satisfaction and that the final dimensions are acceptable. The repair of defects by welding is not allowed.

1.13 Identification

1.13.1 The manufacturer is to adopt a system of identification which will ensure that all finished material in a batch presented for test is of the same nominal chemical composition.

1.13.2 Products are to be clearly marked by the manufacturer in accordance with the requirements of Chapter 1. The following details are to be shown on all materials which have been accepted:

- (a) Manufacturer's name or trade mark.
- (b) Alloy grade and temper condition.
- (c) Identification mark which will enable the full history of the item to be traced.
- (d) The stamp of the LR brand, .

1.14 Certification

1.14.1 The manufacturer's test certificate can be accepted provided it has been stamped and endorsed by the Surveyor.

1.14.2 Each test certificate or shipping statement is to include the following particulars:

- (a) Purchaser's name and order number.
- (b) Contract number.
- (c) Address to which material is to be despatched.
- (d) Description and dimensions.
- (e) Alloy grade and temper condition.
- (f) Identification mark which will enable the full history of the item to be traced.
- (g) Chemical composition.
- (h) Mechanical test results (not required on shipping statement).
- (j) Details of heat treatment, where applicable.

1.14.3 Where the alloy is not produced at the works at which it is wrought, a certificate is to be supplied by the manufacturer of the alloy stating the cast number and chemical composition. The works at which the alloy was produced must be approved by LR.

Section 2

Aluminium alloy rivets

2.1 Scope

2.1.1 Provision is made in this Section for aluminium alloy rivets intended for use in the construction of marine structures.

2.1.2 They are to be manufactured and tested in accordance with the appropriate requirements of Section 1 and those detailed in this Section.

2.2 Chemical composition

2.2.1 The chemical composition of bars used for the manufacture of rivets is to comply with the requirements of Table 8.2.1.

Table 8.2.1 Chemical composition, percentage

Element	5154A	6082
Copper	0,10 max.	0,10 max.
Magnesium	3,1 – 3,9	0,6 – 1,2
Silicon	0,50 max.	0,7 – 1,3
Iron	0,50 max.	0,50 max.
Manganese	0,1 – 0,5	0,4 – 1,0
Zinc	0,20 max.	0,20 max.
Chromium	0,25 max.	0,25 max.
Titanium	0,20 max.	0,10 max.
Other elements: each	0,05 max.	0,05 max.
total	0,15 max.	0,15 max.
Aluminium	Remainder	Remainder

2.3 Heat treatment

2.3.1 Rivets are to be supplied in the following condition:

- 5154A – annealed
- 6082 – solution treated.

2.4 Test material

2.4.1 Bars intended for the manufacture of rivets are to be presented for test in batches of not more than 250 kg. The material in each batch is to be the same diameter and nominal chemical composition.

2.4.2 At least one test sample is to be selected from each batch and, prior to testing, is to be heat treated in full cross-section and in a manner simulating the heat treatment applied to the finished rivets.

2.5 Mechanical tests

2.5.1 At least one tensile and one dump test specimen are to be prepared from each test sample.

2.5.2 The tensile test specimen may be either a suitable length of bar tested in full cross-section or a specimen machined to the dimensions given in Fig. 2.2.2 in Chapter 2.

2.5.3 The dump test specimen is to consist of a section cut from the bar with the ends perpendicular to the axis. The length of this section is to be equal to the diameter of the bar.

2.5.4 The results of tensile tests are to comply with the appropriate requirements of Table 8.2.2.

Table 8.2.2 Mechanical properties for acceptance purposes

Mechanical properties	5154A	6082
0,2% proof stress N/mm ² min.	90	120
Tensile strength N/mm ² min.	220	190
Elongation on $5,65\sqrt{S_0}$ % min.	18	16

2.5.5 The dump test is to be carried out at ambient temperature and is to consist of compressing the specimen until the diameter is increased to 1,6 times the original diameter. After compression, the specimen is to be free from cracks.

2.6 Tests from manufactured rivets

2.6.1 At least three samples are to be selected from each consignment of manufactured rivets. Dump tests as detailed in 2.5 are to be carried out on each sample.

2.7 Identification

2.7.1 Each package of manufactured rivets is to be identified with attached labels giving the following details:

- Manufacturer's name or trade mark.
- Alloy grade.
- Rivet size.

2.8 Certification

2.8.1 The test certificate for each consignment of manufactured rivets is to include the following particulars:

- Purchaser's name and order number.
- Description and dimensions.
- Specification.

Section 3 Aluminium alloy castings

3.1 Scope

3.1.1 Provision is made in this Section for aluminium alloy castings intended for use in the construction of ships, ships for liquid chemicals and other marine structures and liquefied gas piping systems where the design temperature is not lower than minus 165°C. These materials should not be used for piping systems outside cargo tanks except for short lengths of pipes attached to the cargo tanks in which case fire-resisting insulation should be provided.

3.1.2 Castings are to be manufactured and tested in accordance with Chapters 1 and 2 and also with the requirements of this Section.

3.1.3 As an alternative to 3.1.2, castings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

3.2 Manufacture

3.2.1 Castings are to be manufactured at foundries approved by LR.

3.3 Quality of castings

3.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

3.4 Chemical composition

3.4.1 The chemical composition of a sample from each cast is to comply with the requirements given in Table 8.3.1. Suitable grain refining elements may be used at the discretion of the manufacturer. The content of such elements is to be reported in the ladle analysis.

3.4.2 Where it is proposed to use alloys not specified in Table 8.3.1, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval.

3.4.3 When a cast is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis can be accepted subject to occasional checks as required by the Surveyor.

Aluminium Alloys

Chapter 8

Section 3

Table 8.3.1 Chemical composition, percentage

Alloy Element	Al-Mg 3	Al-Si 12	Al-Si 10 Mg	Al-Si 7 High purity
Copper	0,1 max.	0,1 max.	0,1 max.	0,1 max.
Magnesium	2,5—4,5	0,1 max.	0,15—0,4	0,25—0,45
Silicon	0,5 max.	11,0—13,5	9,0—11,0	6,5—7,5
Iron	0,5 max.	0,7 max.	0,6 max.	0,2 max.
Manganese	0,6 max.	0,5 max.	0,6 max.	0,1 max.
Zinc	0,2 max.	0,1 max.	0,1 max.	0,1 max.
Chromium	0,1 max.	—	—	—
Titanium	0,2 max.	0,2 max.	0,2 max.	0,2 max.
Others each	0,05 max.	0,05 max.	0,05 max.	0,05 max.
Total	0,15 max.	0,15 max.	0,15 max.	0,15 max.
Aluminium	Remainder	Remainder	Remainder	Remainder

3.5 Heat treatment

3.5.1 Castings are to be supplied in the following conditions:

Grade Al-Mg 3	—	as-manufactured
Grade Al-Si 12	—	as-manufactured
Grade Al-Si 10 Mg	—	as-manufactured or solution heat treated and precipitation hardened
Grade Al-Si 7 Mg (high purity)	—	solution heat treated and precipitation hardened.

3.6 Mechanical tests

3.6.1 At least one tensile specimen is to be tested from each cast and, where heat treatment is involved, for each heat treatment batch from each cast. Where continuous melting is employed, 500 kg of fettled castings may be regarded as a cast.

3.6.2 The test samples are to be separately cast in moulds made from the same type of material as used for the castings. These moulds should conform to National Standards.

3.6.3 The method and procedures for the identification of the test specimens, and the castings they represent, are to be agreed with the Surveyor. The identification marks are to be maintained during the preparation of test specimens.

3.6.4 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent prior to testing.

3.6.5 The results of all tensile tests are to comply with the appropriate requirements given in Table 8.3.2 and/or Table 8.3.3.

Table 8.3.2 Minimum mechanical properties for acceptance purposes of sand-cast and investment cast reference test pieces

Alloy	Temper (see Note)	Tensile strength N/mm ²	Elongation %
Al-Mg 3	M	150	5
Al-Si 12	M	150	3
Al-Si 10 Mg	M	150	2
Al-Si 10 Mg	TF	220	1
Al-Si 7 Mg	TF	230	5
NOTE			
M refers to as cast condition.			
TF refers to solution heat treated and precipitation hardened condition.			

Table 8.3.3 Minimum mechanical properties for acceptance purposes of chill-cast reference test piece

Alloy	Temper (see Note)	Tensile strength N/mm ²	Elongation %
Al-Mg 3	M	150	5
Al-Si 12	M	170	3
Al-Si 10 Mg	M	170	3
Al-Si 10 Mg	TF	240	1,5
Al-Si 7 Mg	TF	250	5
NOTE			
M refers to as cast condition.			
TF refers to solution heat treated and precipitation hardened condition.			

3.6.6 Where the results of a test do not comply with the requirements, the re-test procedure detailed in Ch 2,1.4 is to be applied. Where castings are to be used in the heat treated condition, the re-test sample must have been heat treated together with the castings it represents.

3.7 Visual examination

3.7.1 All castings are to be cleaned and adequately prepared for inspection.

3.7.2 The accuracy and verification of dimensions are the responsibility of the manufacturer, unless otherwise agreed.

3.7.3 Before acceptance, all castings are to be presented to the Surveyor for visual examination.

3.8 Rectification of defective castings

3.8.1 At the discretion of the Surveyor, small surface blemishes may be removed by local grinding.

3.8.2 Where appropriate, repair by welding may be accepted at the discretion of the Surveyor. Such repair is to be made in accordance with an approved procedure.

Aluminium Alloys

Chapter 8

Sections 3 & 4

3.9 Pressure testing

3.9.1 Where required by the relevant Rules, castings are to be pressure tested before final acceptance. Unless otherwise agreed, these tests are to be carried out in the presence and to the satisfaction of the Surveyor.

3.10 Identification

3.10.1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original cast and the Surveyor is to be given full facilities for tracing the casting when required.

3.10.2 All castings which have been tested and inspected with satisfactory results are to be clearly marked with the following details:

- (a) Identification number, cast number or other markings which will enable the full history of the casting to be traced.
- (b) LR or Lloyd's Register and the abbreviated name of LR's local office.
- (c) Personal stamp of the Surveyor responsible for the inspection.
- (d) Test pressure where applicable.
- (e) Date of final inspection.

3.10.3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

3.11 Certification

3.11.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which have been accepted:

- (a) Purchaser's name and order number.
- (b) Description of castings and alloy type.
- (c) Identification number.
- (d) Ingot or cast analysis.
- (e) General details of heat treatment, where applicable.
- (f) Results of mechanical tests.
- (g) Test pressure, where applicable.

Section 4 Aluminium/steel transition joints

4.1 Scope

4.1.1 Provision is made in this Section for explosion bonded composite aluminium/steel transition joints used for connecting aluminium structures to steel plating.

4.1.2 Each individual application is to be separately approved as required by the relevant Rules dealing with design and construction.

4.2 Manufacture

4.2.1 Transition joints are to be manufactured by an approved producer in accordance with an approved specification which is to include the maximum temperature allowable at the interface during welding.

4.2.2 The aluminium material is to comply with the requirements of Section 1 and the steel is to be of an appropriate grade complying with the requirements of Ch 3,2.

4.2.3 Alternative materials which comply with International, National or proprietary specifications may be accepted provided that they give reasonable equivalence to the requirements of 4.2.2 or are approved for a specific application.

4.2.4 Intermediate layers between the aluminium and steel may be used, in which case the material of any such layer is to be specified by the manufacturer and is to be recorded in the approval certificate. Any such intermediate layer is then to be used in all production transition joints.

4.3 Visual and non-destructive examination

4.3.1 Each composite plate is to be subjected to 100 per cent visual and ultrasonic examination in accordance with a relevant National Standard to determine the extent of any unbonded areas. Unbonded areas are unacceptable and any such area plus 25 mm of surrounding sound material is to be discarded.

4.4 Mechanical tests

4.4.1 Two shear test specimens and two tensile test specimens are to be taken from each end of each composite plate for tests to be made on the bond strength. One shear and one tensile test specimen from each end are to be tested at ambient temperature after heating to the maximum allowable interface temperature, see 4.2.1; the other two specimens are to be tested without heat treatment.

4.4.2 Shear tests may be made on a specimen as shown in Fig. 8.4.1 or an appropriate equivalent. Tensile tests may be made across the interface by welding extension pieces to each surface or by the ram method shown in Fig. 8.4.2 or by an appropriate alternative method.

4.4.3 The shear and tensile strengths of all the test specimens are to comply with the requirements of the manufacturing specification.

4.4.4 If either the shear or tensile strength of the bond is less than the specified minimum but not less than 70 per cent of the specified minimum, two additional shear and two tensile test specimens from each end of the composite plate are to be tested and, in addition, bend tests as described in 4.4.6 and Table 8.4.1 are to be made.

4.4.5 If either the shear or tensile strength of the bond is less than 70 per cent of the specified minimum the cause is to be investigated. After evaluation of the results of this investigation, LR will consider the extent of composite plate which is to be rejected.

Table 8.4.1 **Bend tests on explosion bonded aluminium/steel composites**

Type of test	Minimum bend, degrees	Diameter of former
Aluminium in tension	90	3T
Steel in tension	90	3T
Side bend	90	6T
NOTE T is the total thickness of the composite plate.		

4.4.6 Bend tests, when required, are to be made under the following conditions, as listed in Table 8.4.1:

- The aluminium plate is in tension.
- The steel plate is in tension.
- A side bend is applied.

4.5 Identification

4.5.1 Each acceptable transition strip is to be clearly marked with the following particulars:

- LR or Lloyd's Register and the abbreviated name of LR's local office.
- Manufacturer's name or trade mark.
- Identification mark for the grade of aluminium.
- Identification mark for the grade of steel.

The particulars are to be stamped on the aluminium surface at one end of the strip.

4.6 Certification

4.6.1 Each test certificate or shipping statement is to include the following particulars:

- Purchaser's name and order number.
- The contract number for which the material is intended, if known.
- Address to which the material is dispatched.
- Description and dimensions of the material.
- Specifications or grades of both the aluminium alloy and the steel and any intermediate layer.
- Cast numbers of the steel and aluminium plates.
- Identification number of the composite plate.
- Mechanical test results (not required on shipping statement).

Section

- 1 **Castings for propellers**
- 2 **Castings for valves, liners and bushes**
- 3 **Tubes**

■ **Section 1**
Castings for propellers

1.1 Scope

1.1.1 This Section gives the requirements for copper alloy castings for one-piece propellers and separately cast blades and bosses for fixed pitch and controllable pitch propellers (CPP). These include contra-rotating propellers and propulsors fitted to podded drives and azimuth units.

1.1.2 These castings are to be manufactured and tested in accordance with the appropriate requirements of Chapters 1 and 2 and the specific requirements of this Section.

1.1.3 As an alternative to 1.1.2, castings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or alternatively are approved for a specific application.

1.1.4 The appropriate requirements of this Section may also be applied to the repair and inspection of propellers which have been damaged during service.

1.1.5 Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

1.2 Manufacture

1.2.1 All castings are to be manufactured at foundries approved by Lloyd's Register (hereinafter referred to as 'LR').

1.2.2 The pouring is to be carried out into dried moulds using degassed liquid metal. The pouring is to avoid turbulent flow. Special devices and/or procedures are to be used to prevent slag flowing into the mould.

1.3 Quality of castings

1.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

1.3.2 The removal and repair of defects are dealt with in 1.9 and 1.10.

1.4 Chemical composition

1.4.1 The chemical compositions of samples from each melt are to comply with the manufacturing specification approved by LR and also with the overall limits given in Table 9.1.1. In addition to carrying out chemical analysis for the elements given in the Table, it is expected that manufacturers will ensure that any harmful residual elements are within acceptable limits.

1.4.2 The use of alloys whose chemical compositions are different from those detailed in Table 9.1.1 will be given special consideration by LR.

1.4.3 The manufacturer is to maintain records of all chemical analyses, which are to be made available to the Surveyor so that he can satisfy himself that the chemical composition of each casting is within the specified limits.

1.4.4 When a melt is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis can be accepted subject to occasional checks as required by the Surveyor. If any foundry returns are added to the melts, the ingot manufacturer's chemical analyses are to be supplemented by frequent checks as required by the Surveyor.

Table 9.1.1 Chemical composition of propeller and propeller blade castings

Alloy designation	Chemical composition of ladle samples %							
	Cu	Sn	Zn	Pb	Ni	Fe	Al	Mn
Grade Cu 1 Manganese bronze (high tensile brass)	52–62	0,1–1,5	35–40	0,5 max.	1,0 max.	0,5–2,5	0,5–3,0	0,5–4,0
Grade Cu 2 Ni-manganese bronze (high tensile brass)	50–57	0,1–1,5	33–38	0,5 max.	2,5–8,0	0,5–2,5	0,5–2,0	1,0–4,0
Grade Cu 3 Ni-aluminium bronze	77–82	0,1 max.	1,0 max.	0,03 max.	3,0–6,0	2,0–6,0	7,0–11,0	0,5–4,0
Grade Cu 4 Mn-aluminium bronze	70–80	1,0 max.	6,0 max.	0,05 max.	1,5–3,0	2,0–5,0	6,5–9,0	8,0–20,0

1.4.5 For alloys Grade Cu 1 and Cu 2, the zinc equivalent shall not exceed 45 per cent, and is to be calculated using the following formula:

$$\text{zinc equivalent \%} = 100 - \frac{100 \times \% \text{Cu}}{100 + A}$$

where A is the algebraic sum of the following:

- 1 x % Sn
- 5 x % Al
- 0,5 x % Mn
- 0,1 x % Fe
- 2,3 x % Ni

1.4.6 Samples for metallographic examination are to be prepared from the ends of test bars cast from every melt of Grade Cu 1 and Cu 2 alloys. The proportion of alpha-phase determined from the average of at least five counts is to be not less than 25 per cent.

1.5 Heat treatment

1.5.1 At the option of the manufacturer, castings may be supplied in the 'as-cast' or heat treated condition. However, if heat treatment is to be applied, full details are to be included in the manufacturing specification.

1.5.2 If any welds are made in the propeller casting, stress relief heat treatment is required in order to minimise the residual stresses. Requirements concerning such heat treatment are given in 1.10.

1.6 Test material

1.6.1 Test samples are to be cast separately from each melt used for the manufacture of propeller or propeller blade castings.

1.6.2 The test samples are to be of the keel block type, generally in accordance with the dimensions given in Fig. 9.1.1 and are to be cast in moulds made from the same type of material as used for the castings.

1.6.3 The method and procedures for the identification of the test specimens, and the castings they represent, are to be agreed with the Surveyor. The identification marks are to be transferred and maintained during the preparation of test specimens.

1.6.4 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent.

1.7 Mechanical tests

1.7.1 At least one tensile test specimen representative of each cast is to be prepared. The dimensions of this test specimen are to be in accordance with Fig. 2.2.1 in Chapter 2.

1.7.2 The results of all tensile tests are to comply with the requirements given in Table 9.1.2.

Fig. 9.1.1 Keel block type test sample

Table 9.1.2 Mechanical properties for acceptance purposes: propeller and propeller blade castings

Alloy designation	0,2% proof stress N/mm ² minimum	Tensile strength N/mm ² minimum	Elongation on 5,65√S ₀ % minimum
Grade Cu 1 Manganese bronze (high tensile brass)	175	440	20
Grade Cu 2 Ni-manganese bronze (high tensile brass)	175	440	20
Grade Cu 3 Ni-aluminium bronze	245	590	16
Grade Cu 4 Mn-aluminium bronze	275	630	18

1.7.3 The mechanical properties of alloys whose chemical compositions do not accord with Table 9.1.1 are to comply with a manufacturing specification approved by LR.

1.8 Inspection and non-destructive examination

1.8.1 Propeller castings should be visually inspected at all stages of manufacture. The manufacturer is to draw any significant imperfections to the attention of the Surveyor. Such imperfections are to be verified in accordance with 1.9.

Copper Alloys

Chapter 9

Section 1

1.8.2 All finished castings are to be subjected to a comprehensive visual examination by the Surveyor, including internal surfaces such as the bore and bolt holes.

1.8.3 For the purpose of these requirements, the blades of propellers, including CPP blades, are divided into three severity Zones A, B and C as shown in Fig. 9.1.2 and detailed in 1.8.4 for blades having skew angles of 25° or less and 1.8.5 for blades having skew angles of greater than 25°.

1.8.4 Skew angles of 25° or less:

- Zone A is the area on the pressure side of the blade from and including the root fillet to 0,4*R* and bounded by the trailing edge and by a line at a distance 0,15 times the chord length from the leading edge.
- Zone B includes the areas inside 0,7*R* on both sides of the blade, excluding Zone A.
- Zone C includes the areas outside 0,7*R* on both sides of the blade.

1.8.5 Skew angles of greater than 25°:

- Zone A is the area on the pressure side of the blade bounded by, and including, the root fillet and a line running from the junction of the leading edge with the root fillet to the trailing edge at 0,9*R* and passing through the mid-point of the chord at 0,7*R* and a point situated at 0,3 of the chord length from the leading edge at 0,4*R*.

- Zone A also includes the area along the trailing edge on the suction side of the blade from the root to 0,9*R* and with its inner boundary at 0,15 of the chord length tapering to meet the trailing edge at 0,9*R*.
- Zone B constitutes the whole of the remainder of the blade surfaces.

1.8.6 In propeller blades with continuously loaded tips (CLT), the whole of the tip plate and the adjoining blade to a distance of 100 mm is to be regarded as severity Zone B, see Fig. 9.1.3. For propellers with diameters less than 2 m, the width of this zone may be reduced to one tenth of the propeller radius.

1.8.7 In addition, the palm of a CPP blade is divided into severity Zones A and B as shown in Fig. 9.1.4.

1.8.8 If a CPP blade has an integrally cast journal, the fillets of the journal and the adjoining material up to a distance of 20 mm from the fillet run-outs are to be regarded as Zone B, as indicated in Fig. 9.1.5. The remainder of the surface of the journal may be regarded as Zone C.

1.8.9 Hubs of controllable pitch propellers are to contain a Zone A region at each blade port as shown in Fig. 9.1.6. The remainder may be regarded as Zone C.

1.8.10 On completion of machining and grinding, the whole surface of each casting is to be subjected to a dye penetrant inspection in accordance with a standard or specification approved by LR.

1.8.11 All dye penetrant inspections on Zone A areas in the finished condition are to be made in the presence of the Surveyor.

Copper Alloys

Chapter 9

Section 1

1.8.12 Dye penetrant inspections on Zones B and C are to be performed by the manufacturer and may be witnessed by the Surveyor at his request.

1.8.13 The surface to be inspected shall be divided into reference areas of 100 cm². The indications detected shall, with respect to their size and number, not exceed the values given in Table 9.1.3. The area shall be taken in the most unfavourable location relative to the indication being evaluated.

1.8.14 Indications exceeding the acceptance standard in Table 9.1.3 shall be repaired in accordance with 1.9.

1.8.15 All defects requiring repair by welding in new propeller castings are to be recorded on sketches showing their locations and dimensions. Copies of these sketches are to be presented to the Surveyor prior to repair.

1.8.16 Where repairs have been made either by grinding or welding, the repaired areas are to be subjected to dye penetrant inspection in the presence of the Surveyor, regardless of their location.

1.8.17 Where no welds have to be made on a casting, the manufacturer is to provide the Surveyor with a statement that this is the case.

1.8.18 Where it is suspected that a casting contains internal defects, radiographic and/or ultrasonic examination may be required by the Surveyor. The acceptance criteria are to be agreed between the manufacturer and LR.

1.8.19 The measurement of dimensional accuracy is the responsibility of the manufacturer but the report on dimensional inspection is to be presented to the Surveyor who may require checks to be made and to witness such checks.

1.8.20 Static balancing is to be carried out on all propellers in accordance with the approved plan. Dynamic balancing is necessary for propellers running above 500 rpm.

1.9 Rectification of defective castings

1.9.1 The rectification of defective propeller and propeller blade castings is to be carried out in accordance with the requirements given in 1.9.2 to 1.9.12.

1.9.2 The rectification of small indications within the acceptance standard of Table 9.1.3 is not generally required except where they occur in closely spaced groups.

1.9.3 Where, in the surface of the end face or bore of a propeller boss, local pores are present which do not themselves adversely affect the strength of the casting, they may be filled with a suitable plastic filler after the appropriate preparation of the defective area. The foundry is to maintain records and details of all castings which have been so rectified.

Table 9.1.3 Allowable number and size of dye penetrant indications in a reference area of 100 cm² (see Note 1)

Severity Zones	Max. total number of indications	Type of indications (see Note 2)	Max. number of each type (see Notes 3 and 4)	Max. acceptable value for 'a' or 'l' of indications (mm) (see Note 2)
A	7	Non-linear Linear Aligned	5 2 2	4 3 3
B	14	Non-linear Linear Aligned	10 4 4	6 6 6
C	20	Non-linear Linear Aligned	14 6 6	8 6 6

NOTES

1. The reference area is defined as an area of 0,1 m², which may be square or rectangular, with the major dimension not exceeding 250 mm. The area shall be taken in the most unfavourable location relative to the indication being evaluated.

2. Non-linear, linear and aligned indications are defined as follows:

3. Only indications that have any dimension greater than 1,5 mm shall be considered relevant.

4. Single non-linear indications less than 2 mm in Zone A and less than 3 mm in other zones may be disregarded.

5. The total number of non-linear indications may be increased to the maximum total number, or part thereof, represented by the absence of linear or aligned indications.

Copper Alloys

Chapter 9

Section 1

1.9.4 Where unacceptable defects are found in a casting, they are to be removed by mechanical means, and the surfaces of the resulting depressions are subsequently to be ground smooth. Complete elimination of the defects is to be proved by adequate dye penetrant inspection.

1.9.5 Shallow grooves or depressions resulting from the removal of defects may, at the discretion of the Surveyor, be accepted provided that they will cause no appreciable reduction in the strength of the castings and that they are suitably blended by grinding.

1.9.6 Welded repairs are to be undertaken only when they are considered to be necessary and approved by the Surveyor. In general, welds having an area less than 5 cm² are to be avoided.

1.9.7 All weld repairs are to be carried out in accordance with qualified procedures by suitably qualified welders, and are to be completed to the satisfaction of the Surveyor. Records are to be made available to the Surveyor.

1.9.8 Welding is generally not permitted in Zone A and will only be allowed after special consideration.

1.9.9 Prior approval by the Surveyor is required for any welds in Zone B. Complete details of the repair procedure are to be submitted for each case.

1.9.10 Repair by welding is allowed in Zone C provided that there is compliance with 1.9.6 and 1.9.7.

1.9.11 The maximum area of any single repair and the maximum total area of repair in any one zone or region are given in Table 9.1.4.

1.9.12 Where it is proposed to exceed the areas given in Table 9.1.4, the nature and extent of the repair work are to be approved by the Surveyor before commencement of the repair.

1.10 Weld repair procedure

1.10.1 Welding is to be carried out under cover in positions free from draughts and adverse weather conditions.

1.10.2 The manufacturer is to submit a detailed welding procedure specification covering the weld preparation, welding parameters, filler metal, preheating, post-weld heat treatment and inspection procedures.

1.10.3 Before welding is started, Welding Procedure Qualification tests are to be carried out and witnessed by the Surveyor. Each welder is to be qualified to carry out the proposed welding using the same process, consumable and position which are to be used for the repair.

1.10.4 Defects to be repaired by welding are to be removed completely by mechanical means (e.g. grinding, chipping or milling). Removal of defects is to be demonstrated by dye penetrant inspection in the presence of the Surveyor. The excavation is to be prepared in a manner which will allow good fusion and is to be clean and dry.

Table 9.1.4 Permissible rectification of new propellers by welding

Severity zone or region	Maximum individual area of repair	Maximum total area of repairs
Zone A	Weld repairs not generally permitted	
Zone B	60 cm ² or 0,6% x S whichever is the greater	200 cm ² or 2% x S, whichever is the greater in combined Zones B and C but not more than 100 cm ² or 0,8% x S, whichever is the greater, in Zone B on the pressure side
Zone C		
Other regions (see Note)	17 cm ² or 1,5% area of the region whichever is the greater	50 cm ² or 5% x area of the region whichever is the greater
where $S = \text{area of one side of a blade} = 0,79 \frac{D^2 B}{N}$ $D = \text{finished diameter of propeller}$ $B = \text{developed area ratio}$ $N = \text{number of blades}$		
NOTE Other regions include: (a) the bore; (b) the forward and aft faces of the boss; (c) the outer surface of the boss to the start of the blade root fillets; (d) the inner face of a CPP blade palm; (e) all surfaces of CPP nose cones; (f) the surfaces of integral journals to CPP blades other than the fillets.		

1.10.5 Metal arc welding with the electrodes or filler wire used in the procedure tests is to be used for all types of repairs. Welds should preferably be made in the downhand (flat) position. Where necessary, suitable preheat is to be applied before welding, and the preheat temperature is to be maintained until welding is completed.

1.10.6 When flux coated electrodes are used they are to be dried immediately before use, in accordance with the manufacturer's instructions.

1.10.7 All slag, undercuts and other defects are to be removed before the subsequent run is deposited.

1.10.8 With the exception given in 1.10.9, all weld repairs in areas of solid propellers exposed to sea-water, and all repairs to separately cast blades, are to be stress relief heat treated.

1.10.9 Stress relief heat treatment is not mandatory after welding Grade Cu 3 castings in Zone C unless a welding consumable susceptible to stress corrosion (e.g. complying with the composition range of Grade Cu 4) is used. All welds in Zones A and B however, must be stress relieved by heat treatment, regardless of alloy.

Copper Alloys

Chapter 9

Sections 1 & 2

1.10.10 Propeller and propeller blades are to be stress relieved within the following temperature ranges:

alloy Grades Cu 1 and Cu 2	350°C to 550°C
alloy Grade Cu 3	450°C to 500°C
alloy Grade Cu 4	450°C to 600°C

Soaking times are to be in accordance with Table 9.1.5, and subsequent cooling from the soaking temperature is to be suitably controlled to minimise residual stresses and is not to exceed 50°C per hour until the temperature is below 200°C. Care should be taken to avoid heating castings in the Grade Cu 3 alloy at temperatures between 300° and 400°C for prolonged periods.

Table 9.1.5 Soaking times for stress relief heat treatment of copper alloy propellers

Stress relief temperature °C (see Notes)	Alloy Grade Cu1 and Cu2		Alloy Grade Cu3 and Cu4	
	Hours per 25 mm of thickness	Maximum recommended total time hours	Hours per 25 mm of thickness	Maximum recommended total time hours
350	5	15	—	—
400	1	5	—	—
450	1/2	2	5	15
500	1/4	1	1	5
550	1/4	1/2	1/2	2
600	—	—	1/4	1
NOTES				
1. Treatment at 550°C is not applicable to alloy Grade Cu3.				
2. Treatment at 600°C is only applicable to alloy Grade Cu4.				

1.10.11 Stress relief heat treatment is to be carried out, where possible, in furnaces having suitable atmosphere and temperature control. Sufficient thermocouples are to be attached to the casting to measure the temperature at positions of extremes of thickness.

1.10.12 As an alternative to 1.10.11, local stress relief heat treatment may be accepted, provided that the Surveyor is satisfied that the technique will be effective and that adequate precautions are taken to prevent the introduction of detrimental temperature gradients. Where local stress relief heat treatment is approved, adequate temperature control is to be provided. The area of the propeller or blade adjacent to the repair is to be suitably monitored and insulated to ensure that the required temperature is maintained and that temperature gradients are moderate. Care should be taken to select the shape of an area to be heat treated which will minimise residual stresses.

1.10.13 On completion, welds are to be ground smooth for visual examination and dye penetrant inspection. Where a propeller or propeller blade is to be stress relief heat treated, a visual examination is to be made before heat treatment, and both visual and dye penetrant examinations are to be made after the stress relief heat treatment. Irrespective of location, all weld repairs are to be assessed according to Zone A in Table 9.1.3.

1.10.14 The foundry is to maintain full records detailing the weld procedure, heat treatment and extent and location on drawings of repairs made to each casting. These records are to be available for review by the Surveyor, and copies of individual records are to be supplied to the Surveyor on request.

1.10.15 LR reserves the right to restrict the amount of repair work accepted from a manufacturer when it appears that repetitive defects are the result of improper foundry techniques or practices.

1.11 Identification

1.11.1 Castings are to be clearly marked by the manufacturer in accordance with the requirements of Chapter 1. The following details are to be shown on all castings which have been accepted:

- Identification mark which will enable the full history of the item to be traced.
- Alloy grade.
- LR or Lloyd's Register and the abbreviated name of LR's local office.
- Personal stamp of Surveyor responsible for the final inspection.
- Date of final inspection.
- Skew angle, if in excess of 25°. See the relevant Rules for the definition of skew angle.

1.12 Certification

1.12.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting:

- Purchaser's name and order number.
- Description of casting.
- Alloy designation and/or trade name.
- Identification number of casting.
- Cast identification number if different from (d).
- Details of heat treatment, where applicable.
- Skew angle, if in excess of 25°. See the relevant Rules for the definition of skew angle.
- Final weight of casting.
- Results of non-destructive tests and details of test procedures.
- Proportion of alpha-structure for Cu1 and Cu2 alloys.
- Results of mechanical tests.
- A sketch showing the location and extent of welding repairs (if any).

Section 2 Castings for valves, liners and bushes

2.1 Scope

2.1.1 This Section makes provision for copper alloy castings for valves, liners, bushes and other fittings intended for use in the construction of ships, other marine structures, machinery and pressure piping systems.

Copper Alloys

Chapter 9

Section 2

2.1.2 Castings are to be manufactured and tested in accordance with Chapters 1 and 2, and also with the requirements given in this Section.

2.1.3 As an alternative to 2.1.2, castings which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

2.2 Manufacture

2.2.1 Castings are to be manufactured at foundries approved by LR.

2.3 Quality of castings

2.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

2.4 Chemical composition

2.4.1 The chemical composition is to comply with the requirements of a National or International Standard and, where appropriate, with the limits for the principal elements of the preferred alloys listed in Tables 9.2.1 and 9.2.2.

2.4.2 With the exception given in 2.4.3, chemical analysis is required on each cast.

2.4.3 Where a cast is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis can be accepted subject to occasional check tests as requested by the Surveyor. The frequency of these check tests should, as a minimum, be one in every ten casts. If one of these check analyses fails to comply with the specification, checks are to be made on the previous and subsequent melts. If one or both of these further analyses is unsatisfactory, chemical analysis is to be carried out on all further melts until the Surveyor is satisfied that a return can be made to the use of occasional check tests.

Table 9.2.1 Chemical compositions of long freezing range alloys: principal elements only

Alloy type	Designation	Chemical composition						Typical applications
		Cu	Sn	Zn	Pb	Ni	P	
Phosphor bronze	Cu Sn11P Cu Sn12	87,0 – 89,5 85,0 – 88,5	10,0 – 11,5 11,0 – 13,0	0,05 max. 0,50 max.	0,25 max. 0,7 max.	0,10 max. 2,0 max.	0,5 – 1,0 0,60 max.	Liners, bushes, valves and fittings
Gunmetal	Cu Sn10 Zn2	Remainder	9,5 – 10,5	1,75 – 2,75	1,5 max.	1,0 max.	—	Liners, valves and fittings
Leaded gunmetal	Cu Sn5 Zn5 Pb5	83,0 – 87,0	4,0 – 6,0	4,0 – 6,0	4,0 – 6,0	2,0 max.	0,10 max.	Bushes, valves and fittings
	Cu Sn7 Zn2 Pb3	85,0 – 89,0	6,0 – 8,0	1,5 – 3,0	2,5 – 3,5	2,0 max.	0,10 max.	
	Cu Sn7 Zn4 Pb7	81,0 – 85,0	6,0 – 8,0	2,0 – 5,0	5,0 – 8,0	2,0 max.	0,10 max.	
	Cu Sn6 Zn4 Pb2	86,0 – 90,0	5,5 – 6,5	3,0 – 5,0	1,0 – 2,0	1,0 max.	0,05 max.	
Leaded bronze	Cu Sn10 Pb10	78,0 – 82,0	9,0 – 11,0	2,0 max.	8,0 – 11,0	2,0 max.	0,10 max.	Bushes
	Cu Sn5 Pb9	80,0 – 87,0	4,0 – 6,0	2,0 max.	8,0 – 10,0	2,0 max.	0,10 max.	
	Cu Sn7 Pb15	74,0 – 80,0	6,0 – 8,0	2,0 max.	13,0 – 17,0	0,5 – 2,0	0,10 max.	
	Cu Sn5 Pb20	70,0 – 78,0	4,0 – 6,0	2,0 max.	18,0 – 23,0	0,5 – 2,5	0,10 max.	

Table 9.2.2 Chemical compositions of short freezing range alloys: principal elements only

Alloy type	Designation	Chemical composition								Typical applications
		Cu	Ni	Fe	Mn	Cr	Nb	Si	Al	
Copper 30% nickel	Cu Ni30 Fe1 Mn1	64,5 min.	29,0–31,0	0,5–1,5	0,6–1,2	—	—	0,1 max.	—	Flanges, valves and fittings
	Cu Ni30 Fe1 Mn1 Nb Si	Remainder	29,0–31,0	0,5–1,5	0,6–1,2	—	0,5–1,0	0,3–0,7	—	
	Cu Ni30 Cr2 Fe Mn Si (see Note)	Remainder	29,0–32,0	0,5–1,0	0,5–1,0	1,5–2,0	—	0,15–0,50	—	
Copper 10% nickel	Cu Ni10 Fe1 Mn1	84,5 min.	9,0–11,0	1,0–1,8	1,0–1,5	—	1,0 max.	0,10 max.	—	Flanges, valves and fittings
Aluminium bronze	Cu Al10 Fe5 Ni5	76,0–83,0	4,0–6,0	4,0–5,5	3,0 max.	—	—	0,1 max.	8,5–10,5	Bushes, valves and fittings
	Cu Al11 Fe6 Ni6	72,0–78,0	4,0–7,5	4,0–7,0	2,5 max.	—	—	0,1 max.	10,0–12,0	

NOTE

Normally alloy Cu Ni30 Cr2 Fe Mn Si contains 0,1 to 0,25% titanium and 0,05 to 0,15% zirconium.

2.5 Heat treatment

2.5.1 Where required by the specification, castings may be supplied in either the 'as-cast' or heat treated condition.

2.5.2 Where castings are supplied in a heat treated condition, the test samples are to be heat treated with the castings they represent prior to the preparation of the tensile test specimens.

2.6 Test material

2.6.1 Test material sufficient for the tests specified in 2.6.4 and for possible re-test purposes is to be provided for each cast of material.

2.6.2 The test material is to be separately cast into moulds made of the same material as that used for the castings they represent.

2.6.3 For the alloys listed in Table 9.2.1, sand cast test bars are generally to be in accordance with Fig. 9.2.1.

2.6.4 For the alloys listed in Table 9.2.2, keel block type test samples are to be in accordance with Fig. 9.1.1.

2.6.5 If it is proposed to use any other form of test bar, this is to be agreed in advance with the Surveyor.

2.6.6 As an alternative, for liners and bushes, the test material may be taken from the ends of the castings.

2.7 Mechanical tests

2.7.1 A tensile test specimen is to be prepared from each test sample. The dimensions of the specimens are to comply with Fig. 2.2.1 or Fig. 2.2.2 in Chapter 2.

2.7.2 The results of all tests are to comply with the appropriate requirements given in Tables 9.2.3 and 9.2.4.

2.8 Inspection

2.8.1 All castings are to be cleaned and adequately prepared for inspection. Before acceptance, all castings are to be presented to the Surveyor for visual examination. This is to include the examination of internal surfaces, where applicable.

2.8.2 For valves and other pressure components, dye penetrant inspection is required and the Surveyor is to witness the tests.

2.8.3 The accuracy and verification of dimensions are the responsibility of the manufacturer. However, the report on dimensional inspection is to be presented to the Surveyor who may require checks to be made in his presence.

Copper Alloys

Chapter 9

Section 2

Table 9.2.3 Mechanical properties of long freezing range alloys for acceptance purposes

Alloy type	Designation	0,2% proof stress N/mm ² minimum (See Note 1)		Tensile strength N/mm ² minimum		Elongation on $5,65 \sqrt{S_0}$ % minimum	
		Sand	Centrifugal	Sand	Centrifugal	Sand	Centrifugal
Phosphor bronze	Cu Sn11 P Cu Sn12	130	170	250	330	5	4
		140	150	260	280	7	5
Gunmetal	Cu Sn10 Zn2	130	130	270	250	13	5
Leaded gunmetal	Cu Sn5 Zn5 Pb5	90	110	200	250	13	13

	Cu Sn7 Zn4 Pb7	120	120	230	260	15	12
	Cu Sn6 Zn4 Pb2	110	110	220	240	15	12
Leaded bronze	Cu Sn10 Pb10	80	110	180	220	8	6
	Cu Sn5 Pb9	60	90	160	200	7	6
	Cu Sn7 Pb15	80	90	170	200	8	7
	Cu Sn5 Pb20	70	80	150	170	5	6
NOTES 1. The 0,2% proof stress values are given for information purposes only and, unless otherwise agreed, are not required to be verified by test. 2. Castings may be supplied in the chill cast condition in which case the mechanical properties requirements are to be in accordance with a specification agreed by LR.							

Table 9.2.4 Mechanical properties of short freezing range alloys for acceptance purposes

Alloy type	Designation	0,2% proof stress N/mm ² minimum (See Note 1)		Tensile strength N/mm ² minimum		Elongation on $5,65 \sqrt{S_0}$ % minimum	
		Sand	Centrifugal	Sand	Centrifugal	Sand	Centrifugal
Copper 30% Nickel	Cu Ni30 Fe1 Mn1	120	120	340	340	18	18
	Cu Ni30 Fe1 Mn1 Nb Si	230	—	440	—	18	—
	Cu Ni30 Cr2 Fe Mn Si	250	—	440	—	18	—

Aluminium Bronze	Cu Al10 Fe5 Ni5	250	280	600	650	13	13
	Cu Al11 Fe6 Ni6	320	380	680	750	5	5

2.9 Rectification of defective castings

2.9.1 Subject to the prior approval of the Surveyor, castings containing local porosity may be rectified by impregnation with a suitable plastic filler provided that the extent of the porosity is such that it does not adversely affect the strength of the casting.

2.9.2 Proposals to repair a defective casting by welding are to be submitted to the Surveyor before this work is commenced. The Surveyor is to be satisfied that the number, position and size of the defects are such that the castings can be efficiently repaired.

2.9.3 Where approval is given for the repair by welding, complete elimination of the defects is to be proven by adequate non-destructive testing.

2.9.4 All welding is to be in accordance with an approved and qualified weld procedure and carried out by a qualified welder.

2.9.5 A statement and/or sketch detailing the extent and position of all weld repairs is to be prepared by the manufacturer as a permanent record. These records are to be available for review by the Surveyor, and copies of individual records are to be supplied to the Surveyor on request.

2.9.6 The alloys listed in Table 9.2.1 are not satisfactory for repair by welding which is generally not permitted. Weld repairs may, however, be considered in special circumstances provided that a suitable procedure, with proof of previous satisfactory repairs is submitted to the Surveyor.

2.9.7 The welding during manufacture of liners is not permitted in any alloy containing more than 0,5 per cent lead.

2.10 Pressure testing

2.10.1 Where required by the relevant Rules, castings are to be pressure tested before final acceptance. Unless otherwise agreed, these tests are to be carried out in the presence of the Surveyors and are to be to their satisfaction.

Copper Alloys

Chapter 9

Sections 2 & 3

2.11 Identification

2.11.1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original cast, and the Surveyor is to be given full facilities for tracing the casting when required.

2.11.2 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked by the manufacturer with the following details:

- (a) Identification number, cast number or other markings which will enable the full history of the casting to be traced.
- (b) LR or Lloyd's Register and the abbreviated name of LR's local office.
- (c) Personal stamp of the Surveyor responsible for inspection.
- (d) Test pressure, where applicable.
- (e) Date of final inspection.

2.11.3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

2.12 Certification

2.12.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which has been accepted:

- (a) Purchaser's name and order number.
- (b) Description of castings and alloy grade.
- (c) Identification number.
- (d) Ingot or cast analysis.
- (e) Full details of heat treatment, where applicable.
- (f) Mechanical test results.
- (g) Test pressure, where applicable.

2.12.2 In addition to 2.12.1, the manufacturer is to provide, where applicable, a statement and/or sketch detailing the extent and position of all weld repairs made to each casting.

Section 3 Tubes

3.1 Scope

3.1.1 Provision is made in this Section for seamless copper and copper alloy tubes intended for use in condensers, heat exchangers and pressure piping systems.

3.1.2 Tubes for Class I and II pressure systems (as defined in the relevant Rules) are to be manufactured and tested in accordance with the requirements of Chapters 1 and 2 and the requirements of this Section.

3.1.3 As an alternative to 3.1.2, tubes which comply with National or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Chapter 1.

3.1.4 Tubes for Class III pressure systems are to be manufactured and tested in accordance with the requirements of a National or International Standard recognised by LR. The manufacturer's test certificate will be acceptable and is to be provided for each batch of material.

3.2 Manufacture

3.2.1 Tubes for Class I and II pressure systems are to be manufactured at a works approved by LR for the grade of material being supplied.

3.2.2 Tubes for Class III pressure systems are not required to be manufactured at a works approved by LR.

3.3 Quality

3.3.1 Tubes are to be clean and free from surface and internal defects and residues from manufacturing operations.

3.3.2 The tubes are to be supplied in smooth, round, straight lengths, free from deleterious films in the bore. The ends are to be cut clean and square with the axis of the tube and are to be de-burred.

3.4 Dimensional tolerances

3.4.1 The tolerances on the wall thickness and diameter of the tubes are to be in accordance with a National or International Standard recognised by LR.

3.4.2 The measurement of dimensional accuracy and compliance with the specification are the responsibility of the manufacturer, but the reports are to be made available to the LR Surveyors, who may require checks to be made in their presence.

3.5 Chemical composition

3.5.1 The chemical composition is to comply with the requirements of a National or International Standard recognised by LR and comply with the base limits for the principal elements given in Table 9.3.1.

3.6 Heat treatment

3.6.1 Copper-phosphorus and aluminium brass tubes are to be supplied in the annealed condition. Aluminium brass tubes may additionally be required to be given a suitable stress relieving heat treatment when subjected to a cold straightening operation after annealing.

Copper Alloys

Chapter 9

Section 3

Table 9.3.1 Chemical composition of principal elements only

Designation	Chemical composition %								
	Cu	As	P	Fe	Pb	Ni	Al	Mn	Zn
Copper-phosphorus deoxidised–non-arsenical	99,85 min.	—	0,013–0,050	—	—	—	—	—	—
Copper-phosphorus deoxidised–arsenical	99,2 min.	0,30–0,50	0,013–0,050	—	—	—	—	—	—
Aluminium brass	76,0–79,0	0,02–0,06	—	0,06 max.	0,07 max.	—	1,8–2,5	—	Remainder
90/10 Copper-nickel-iron (see Note)	Remainder	—	—	1,0–2,0	—	9,0–11,0	—	0,5–1,0	—
70/30 Copper-nickel-iron (see Note)	Remainder	—	—	0,40–1,00	—	29,0–33,0	—	0,5–1,5	—
NOTE Where the purchaser specifies that the product is intended for subsequent welding applications, the following limits will apply: Zn 0,50% max. S 0,02% max. Pb 0,02% max. C 0,05% max. P 0,02% max.									

Table 9.3.2 Mechanical properties for acceptance purposes

Designation	0,2% proof stress N/mm ² minimum	Tensile strength N/mm ² minimum	Elongation on $5,65\sqrt{S_0}$ % minimum	Drift expansion test % minimum	Grain size mm maximum (see Note)
Copper-phosphorus deoxidised–non-arsenical	65	220	40	40	—
Copper-phosphorus deoxidised–arsenical	65	220	40	40	—
Aluminium brass	125	320	40	30	0,045
90/10 Copper-nickel-iron	100	270	30	30	0,045
70/30 Copper-nickel-iron	120	360	30	30	0,045
NOTE When a maximum grain size is specified, the structure is to be completely re-crystallised. The manufacturer is to guarantee the grain size, but testing of each batch will not be required.					

3.6.2 Tubes in the copper-nickel iron alloys are to be supplied in a solution heat treated condition to ensure that no iron rich phases are present.

3.7 Mechanical tests

3.7.1 Tubes are to be presented for test in batches of 300 lengths. A batch is to consist of tubes of the same size, manufactured from the same material grade.

3.7.2 At least one length is to be selected at random from each batch and subjected to the following tests:

- Tensile test.
- Flattening test.
- Drift expanding test.

3.7.3 The procedures for mechanical tests and the dimensions of the test specimens are to be in accordance with Chapter 2.

3.7.4 The flattening test is to be continued until the interior surfaces of the tube meet.

3.7.5 For the drift expanding test, the mandrel is to have an included angle of 45°.

3.7.6 The results of all mechanical tests are to comply with the appropriate requirements given in Table 9.3.2.

3.7.7 At the discretion of the Surveyor, a modified testing procedure may be adopted for small quantities of materials. In such cases, these may be accepted on the manufacturer's declared chemical composition and hardness tests or other evidence of satisfactory properties.

Copper Alloys

Chapter 9

Section 3

3.8 Visual examination

3.8.1 All tubes are to be visually examined. The manufacturer is to provide adequate lighting conditions to enable an internal and external examination of the tubes to be carried out.

3.8.2 The inner and outer surfaces are to be clean and smooth but may have a superficial, dull iridescent film on both the inner and outer surfaces.

3.9 Stress corrosion cracking test

3.9.1 This is an accelerated test for detecting the presence in tubes of internal stresses which might result in failure, in storage or in service, due to stress corrosion cracking.

3.9.2 The test is applicable only to aluminium brass and copper-nickel-iron tubes.

3.9.3 The test specimen is to consist of a 150 mm length cut from the tube selected for mechanical tests in accordance with 3.7.2.

3.9.4 The test is to be carried out in accordance with a National or International Standard recognised by LR.

3.9.5 The test specimen is to be immersed in a mercurous nitrate solution at room temperature for 30 minutes. Aluminium brass specimens are to be examined for cracks immediately after rinsing, while copper-nickel-iron specimens are to be examined 24 hours after rinsing.

3.9.6 Should any specimen fail to meet the requirements of this test, then all tubes represented by that specimen are to be withdrawn. The tubes may be re-submitted after stress relieving treatments for full testing in accordance with 3.7 and 3.9.

3.10 Hydraulic test

3.10.1 Each tube is to be subjected to a hydraulic test at the manufacturer's works.

3.10.2 The hydraulic test pressure is to be determined from the following formula, except that the maximum test pressure need not exceed 70 bar:

$$P = \frac{20st}{D}$$

where

- P = test pressure, in bar
- D = nominal outside diameter, in mm
- t = nominal wall thickness, in mm
- s = 40 for copper-phosphorus
60 for Al-brass and
90/10 copper nickel iron
75 for 70/30 copper nickel iron.

3.10.3 The test pressure is to be maintained for sufficient time to permit proof that the tubes do not weep, leak or undergo a permanent increase in diameter. Unless otherwise agreed, the manufacturer's certificate of satisfactory hydraulic test will be accepted.

3.10.4 Where it is proposed to adopt a test pressure other than that determined in 3.10.2, the proposal will be subject to special consideration.

3.10.5 Subject to special approval, an eddy current test can be accepted in lieu of the hydraulic test.

3.11 Rectification of defects

3.11.1 The repair of defects by welding is not permitted.

3.12 Identification

3.12.1 Tubes are to be clearly marked by the manufacturer in accordance with the requirements of Chapter 1. The following details are to be shown on all materials which have been accepted:

- (a) LR or Lloyd's Register.
- (b) Manufacturer's name or trade mark.
- (c) Grade of material or designation code.
- (d) Identification number and/or initials which will enable the full history of the item to be traced.

3.12.2 Identification is to be by rubber stamp or stencils. Hard stamping is not permitted.

3.13 Certification

3.13.1 The manufacturer is to provide the Surveyor with copies of the test certificate or shipping statement for all material which has been accepted.

3.13.2 Each test certificate is to contain the following particulars:

- (a) Purchaser's name and order number.
- (b) Specification or grade of material.
- (c) Description and dimensions.
- (d) Cast number and chemical composition.
- (e) Mechanical test results.
- (f) Results of stress corrosion cracking test, where applicable.
- (g) Hydraulic test report.

■ Section 1 Anchors

1.1 Scope

1.1.1 This Section makes provision for the manufacture and testing of anchors constructed from cast, forged and fabricated components.

1.1.2 In the context of this Section, the reference to swivels refers to those directly attached to the anchor shank in lieu of the conventional 'D' shackle. For other mooring equipment swivels, see 2.13.

1.2 Manufacture

1.2.1 All anchors are to be of an approved design.

1.3 Cast steel anchors

1.3.1 Cast steel anchor heads, shanks, shackles and swivels are to be manufactured and tested in accordance with the requirements of Ch 4,1 and Ch 4,2. The Special grade quality is to be used for anchor heads, shanks and shackles.

1.3.2 Where acid soluble aluminium content is controlled in the range 0,015 per cent to 0,040 per cent, the nitrogen content need not be determined for each cast, provided that random checks are carried out to the satisfaction of LR.

1.3.3 Special consideration will be given to the use of other grades of steel for the manufacture of swivels.

1.3.4 To confirm the quality of cast anchor components, the surveyor may require drop and/or hammering tests to be carried out.

1.3.5 When drop and hammering tests are required, they are to be carried out as follows:

- (a) Each anchor, or the components of an anchor made from more than one piece, is to be dropped from a clear height of 4 m onto a steel slab laid on a solid foundation.

- (b) Separately cast flukes, shanks and shackles are to be suspended horizontally from a clear height of 4 m before being dropped.
- (c) Anchors cast in one piece are to be drop tested twice from a clear height of 4 m. For the first test, the shank and flukes are to be horizontal. For the second test, two steel blocks are to be placed on the slab, arranged so that the middle of each fluke makes contact with the blocks without the crown making contact with the slab, and the orientation of the anchor is to be vertical with the crown nearest the slab.
- (d) If the slab is broken by the impact, the test is to be repeated on a new slab.

1.3.6 When hammering tests are required, they are to be carried out after the drop test on each anchor head and shank, which is slung clear of the ground, using a non-metallic sling, and hammered to check the soundness of the component. A hammer of at least 3 kg mass is to be used.

1.3.7 Repair of fractures or unsoundness detected during the drop or hammering tests are not permitted and the component is to be rejected.

1.4 Forged steel anchors

1.4.1 Forged steel anchor pins, swivels, shanks and shackles are to be manufactured and tested in accordance with the requirements of Ch 5,1 and Ch 5,2 carbon and carbon-manganese steel for welded construction. Rolled steel bar may be used provided that the requirements of Ch 5,1.2.9 are met.

1.4.2 Special consideration will be given to other grades of steel for the manufacture of swivels.

1.5 Fabricated steel anchors

1.5.1 Where it is proposed to use plate material for fabricated steel anchors, it is to comply with the requirements of Ch 3,2 or Ch 3,3, and the proposed manufacturing procedure is to be submitted for approval.

1.5.2 The manufacturing process is to be in accordance with approved welding procedures, using approved welding consumables and carried out by qualified welders.

1.5.3 Stress relief is to be carried out as required in the approved welding procedure.

1.6 Rectification

1.6.1 All rectification is to be agreed with the Surveyor.

1.6.2 Rectification of defective castings is to be carried out in accordance with Ch 4,1.9.

1.6.3 Rectification of defective forgings is to be carried out in accordance with Ch 5,1.9.

Equipment for Mooring and Anchoring

Chapter 10

Section 1

1.6.4 Rectification of defective fabricated anchors is to be carried out by suitably qualified welders within the parameters of the approved welding procedure used in construction.

1.7 High holding power (HHP) anchors

1.7.1 Anchor designs for which approval is sought as high holding power anchors are to be tested at sea to show that they have holding powers of at least twice those of approved standard stockless anchors of the same mass.

1.7.2 If approval is sought for a range of sizes, then at least two sizes are to be tested. The smaller of the two anchors is to have a mass not less than one-tenth of that of the larger anchor, and the larger of the two anchors tested is to have a mass not less than one-tenth of that of the largest anchor for which approval is sought.

1.7.3 High holding power anchors are to be of a design that will ensure that the anchors will take effective hold of the sea bed without undue delay and will remain stable, for holding forces up to those required by 1.7.1, irrespective of the angle or position at which they first settle on the sea bed when dropped from a normal type of hawse pipe. In case of doubt, a demonstration of these abilities may be required.

1.7.4 The test should normally be carried out from a tug or other suitable vessel, and the pull measured by dynamometer or derived from recently verified curves of tug rev/min against bollard pull. The tests are to be conducted on not less than three different types of bottom, which should normally be soft mud or silt, sand or gravel, and hard clay or similarly compacted material. A scope of 10 is recommended for the anchor cable, but in no case should a scope of less than 6 be used. The same scope is to be used for the anchor for which approval is sought and the anchor that is being used for comparison purposes.

1.8 Assembly

1.8.1 Assembly and fitting is to be carried out in accordance with the approved design.

1.8.2 Securing of anchor pins, shackle pins or swivels by welding is to be carried out by suitably qualified welders in accordance with an approved welding procedure.

1.9 Proof test of anchors

1.9.1 Anchors having a mass of 75 kg or more inclusive of stock (56 kg in the case of high holding power anchors) are to be tested in the presence of the Surveyor at a proving establishment recognised by LR. A list of recognised proving establishments is published separately by LR. In addition to the requirements stated in this Chapter, attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship or mobile offshore unit is to be registered.

1.9.2 The anchor is to be visually examined before application of the proof test load to ensure that it is free from surface defects of a harmful nature.

1.9.3 As required by 1.9.1, each anchor is to be subjected to a proof loading test in an approved testing machine and is to withstand the load given in Table 10.1.1 for the appropriate mass of the anchor. The proof load is to be applied on the arm or on the palm at a spot which, measured from the extremity of the bill, is one-third of the distance between it and the centre of the crown. For stocked anchors, each arm is to be tested individually. For stockless anchors, both arms are to be tested at the same time, first on one side of the shank, then reversed and tested on the other.

1.9.4 The general arrangements for the test are to be such that the complete anchor, including the shackle, shackle pins and any welded or bolted connections are included in the test. If a replacement shackle is needed which requires welding or heating for fitting, the combined anchor and shackle are to be proof load tested. If welding or heating is not involved in fitting, the shackle may be proof load tested separately from the anchor.

1.9.5 The mass to be used in Table 10.1.1 is:

- (a) For stockless anchors, the total mass of the anchor.
- (b) For stocked anchors, the mass of the anchor excluding the stock.
- (c) For high holding power anchors, a nominal mass equal to 1,33 times the actual total mass of the anchor.
- (d) For mooring anchors, including positional mooring anchors, a nominal mass equal to 1,33 times the actual total mass of the anchor, unless specifically agreed otherwise.
- (e) For super high holding power anchors, a nominal mass equal to twice the actual total mass of the anchor.

1.9.6 For positional mooring anchors, the proof test loading is to be that required by 1.9.3 or 50 per cent of the minimum break strength of the intended anchor line, whichever is the greater.

1.9.7 The gauge length is to be measured with 10 per cent of the required load applied, before and after proof test. The two measurements shall differ by no more than 1 per cent. The gauge length is the distance between the tip of each fluke and a point on the shank adjacent to the shackle pin, see Fig. 10.1.1.

1.10 Non-destructive testing

1.10.1 All parts must have a clean surface consistent with the method of manufacture and be free from cracks, laps, notches, inclusions and other defects which would be detrimental to service performance.

1.10.2 After proof testing all accessible surfaces are to be visually inspected by the Surveyor.

Equipment for Mooring and Anchoring

2000	349,0	7400	832,0	46 000	2650,0
2100	362,0	7600	845,0	48 000	2730,0
Proof loads for intermediate mass are to be determined by linear interpolation					
NOTES					
1. Where ordinary anchors have a mass exceeding 48 000 kg, the proof loads are to be taken as $2,059 (\text{mass of anchor in kg})^{2/3}$ kN.					
2. Where high holding power anchors have a mass exceeding 36 000 kg, the proof loads are to be taken as $2,452 (\text{actual mass of anchor in kg})^{2/3}$ kN.					

1.10.3 Each cast anchor head, shank, shackle and swivel is to be subjected to magnetic particle or dye penetrant inspection on all surfaces. For ordinary and HHP anchors, where drop and hammering tests have been carried out, the inspection may be restricted to the areas around runners and risers, or where excess material has been removed by thermal methods and weld repairs.

1.10.4 Each casting is to be subjected to ultrasonic inspection in the region of runners and risers, or where excess material has been removed by thermal methods. This examination is to extend around the whole periphery of the casting and for a distance of $t/3$ beyond the area affected, where t is the maximum thickness. In addition, random areas are to be selected by the Surveyor and examined.

1.10.5 Ultrasonic testing is not required for ordinary and HHP anchors where drop and hammering tests have been carried out.

1.10.6 All fabrication and repair welds are to be subjected to magnetic particle or dye penetrant inspection.

1.10.7 Paint or anti-corrosive coatings are not to be applied until these inspections are completed to the satisfaction of the Surveyor.

1.11 Clearances and tolerances

1.11.1 Where no fitting tolerances are specified on the approved plans the following assembly and fitting tolerance are to be applied.

1.11.2 The clearance either side of the shank within the shackle jaws and the shackle pin in the shank end hole is to be no more than 3 mm for small anchors up to 3 tonnes, 4 mm for anchors up to 5 tonnes, 6 mm for anchors up to 7 tonnes and is not to exceed 12 mm for larger anchors.

1.11.3 The shackle pin is to be a push fit in the eyes of the shackle, which are to be chamfered on the outside to ensure a good tightness when the pin is clenched over on fitting. The shackle pin to hole tolerance is to be no more than 0,5 mm for pins up to 57 mm and 1,0 mm for pins of larger diameter.

1.11.4 The trunnion pin is to be a snug fit within the chamber and be long enough to prevent horizontal movement. The gap is to be no more than 1 per cent of the chamber length.

1.11.5 The lateral movement of the shank is not to exceed 3 degrees from the centreline datum, see Fig. 10.1.2.

1.12 Identification

1.12.1 All identification marks are to be stamped on one side of the anchor reserved solely for this purpose.

Fig. 10.1.1 Location of gauge length measurement during proof load

Fig. 10.1.2 Allowable lateral movement of shank

1.12.2 The following details are to be shown on all anchors:

- LR or Lloyd's Register and abbreviated name of LR's local office issuing the certificate.
- Number of the certificate.
- Month and year of test.
- Mass (also the letters 'HHP' when approved as high holding power anchors).
- Mass of stock (in the case of stocked anchors).
- National Authority requirements, as applicable.
- Manufacturer's mark.

1.12.3 In addition to 1.11.2, each important part of an anchor is to be plainly marked by the maker with the words 'forged steel' or 'cast steel' as appropriate. Fabricated steel anchor heads do not require special marking.

1.13 Certification

1.13.1 The manufacturer is to provide the Surveyor with a written statement that the anchor has been manufactured and tested in accordance with LR Rules together with the following particulars:

- Purchaser's name and order number.
- Type of anchor and principal dimensions.
- Mass of anchor.
- Identification mark which will enable the full history of manufacture to be traced.
- Chemical composition.
- Details of heat treatment.
- Mechanical test results.
- Proof load.
- Results of the non-destructive examination.
- Weld repair details (cast steel anchors only).

1.13.2 Shanks, heads, pins, shackles and swivels are to be certified by LR in accordance with the relevant sections of Chapters 3, 4 and 5.

1.13.3 An LR Anchor Certificate is to be issued for the completed anchor which will include the following details:

- Manufacturer's name.
- Type of anchor.
- Mass of anchor.
- Grade of materials.
- Proof test load.
- Heat treatment.
- Marking applied to anchor.
- Dimensions.
- General Approval of an Anchor Design Certificate Number.

Equipment for Mooring and Anchoring

Chapter 10

Section 2

Section 2

Stud link chain cables for ships

2.1 Scope

2.1.1 Provision is made in this Section for a range of grades, U1, U2 and U3, of stud link chain and fittings intended for anchor or mooring cables for ships.

2.1.2 The requirements for offshore mooring chain cables are given in Section 3.

2.2 Manufacture

2.2.1 All grades of chain cable and accessories are to be manufactured by approved procedures at works approved by LR. A list of approved manufacturers of stud link chain cables and fittings is published separately by LR.

2.2.2 The links may be made by the flash-butt or other approved welding process, or in the case of Grades U2 and U3 they may be flash-butt welded or drop forged, designated U2(a) or U3(a), or cast steel designated U2(b) or U3(b), see Table 10.2.5.

2.2.3 As far as practicable, consecutive links in all chain cable should originate from a single cast or batch of bar stock (see Ch 3,9.6.1), and indicating marks should be stamped on the final link formed from one cast or batch and the first link formed from a separate cast or batch.

2.2.4 A length of chain cable is to measure not more than 27,5 m and is to comprise an odd number of links. In this context, a length is a statutory term and is the basis for the number of test samples.

2.3 Flash butt welded chain cable

2.3.1 Bar material is to comply with the requirements of Ch 3,9 and may be heated either by electrical resistance or in a furnace. For electrical resistance heating, the process is to be controlled by an optical heat sensor. For furnace heating, thermocouples in close proximity to the bars are to be used for control. The temperature is to be continuously recorded. In both cases, the controls are to be checked at least once every eight hours and checks are to be recorded.

2.3.2 Mechanical properties testing of U1 cable is not required. For Grade U2 cable supplied in the as-welded condition, and Grade U3 in all conditions, one tensile and one set of three Charpy V-notch impact test specimens are to be taken at the side of a link opposite the weld from at least every fourth 27,5 m length of cable. A further set of three impact test specimens is to be taken with the notch positioned at the centre of the weld, see Table 10.2.3. The test specimens are not to be selected from the same length as that from which the breaking test sample is taken, unless breaking test samples are to be taken from every length of the batch. All test samples are to be correctly identified with the lengths of cable represented.

2.3.3 The test links from which the mechanical test specimens are prepared are to be made as part of the chain cable and are to be heat treated with it. They may be removed from the cable prior to heat treatment provided that each sample is heat treated with, and in the same manner as, the chain it represents and is subjected to the proof load appropriate to the chain grade and diameter prior to preparation of the mechanical test specimens.

2.3.4 The results of tests on specimens taken from the non-welded areas are to comply with the appropriate requirements of Table 10.2.1. The results of tests on the welds are to comply with the requirements of Table 10.2.6.

2.4 Cast chain cables

2.4.1 The manufacture of cast steel chain cable is generally to be in accordance with the requirements of Ch 4,1, as appropriate.

Table 10.2.1 Mechanical properties of finished chain cable and fittings

Grade	Yield stress N/mm ² minimum	Tensile strength N/mm ²	Elongation on $5,65\sqrt{S_0}$ % minimum	Reduction of area % minimum	Charpy V-notch impact tests	
					Test temperature °C	Average energy J minimum
U2	295	490 – 690	22	—	0 (see Note 1)	27
U3	410	690 minimum	17	40	0 –20 (see Note 2)	60 35

NOTES

- When required see Table 10.2.3.
- Testing may be carried out at either 0°C or –20°C.
- Mechanical testing is not required for finished chain cables and fittings in Grade U1.

Equipment for Mooring and Anchoring

Chapter 10

Section 2

2.4.2 The chemical composition of ladle samples is to comply with the specification approved by LR.

2.4.3 Separately cast test samples are to be provided from each cast. They are to be of similar dimensions to the links they represent and are to be heat treated together with, and in the same manner as, the completed chain cable, see Table 10.2.3.

2.4.4 Tensile and Charpy V-notch impact test specimens are to be taken from each test sample and machined to the dimensions given in Ch 2.3.

2.4.5 The results of all tests are to comply with the requirements given in Table 10.2.1 for the relevant grade.

2.5 Forged chain cables

2.5.1 The procedure for the manufacture and testing of drop forgings for chain cable will be specially considered, but is generally to be in accordance with the appropriate requirements of Ch 5.1.

2.5.2 The chemical composition is to comply with Table 10.2.2.

2.5.3 Stock material may be supplied in the as-rolled condition. The completed forgings are to be heat treated in accordance with Table 10.2.3.

2.5.4 Test samples in the form of forgings of similar dimensions to the links they represent and from the same cast and heat treatment charge are to be provided.

Table 10.2.2 Chemical composition of butt welded and forged chain cable

Grade	Chemical composition %												
	C max.	Si	Mn	P max.	S max.	Al	N max.	Cr max.	Cu max.	Nb max.	Ni max.	V max.	Mo max.
U1	0,20	0,15 – 0,35	0,40 min.	0,04	0,04	—	—	—	—	—	—	—	—
U2	0,24	0,15 – 0,55	1,60 max.	0,035	0,035	0,02 min. see Note 1	—	—	—	—	—	—	—
U3	0,33	0,15 – 0,35	1,90 max.	0,04	0,04	0,065 max. see Note 2	0,015	0,25	0,35	0,05 see Note 2	0,40	0,10 see Note 2	0,08

NOTES

- Aluminium may be partly replaced by other grain refining elements.
- To obtain fine grain steel, at least one of these grain refining elements must be present in sufficient amount.

Table 10.2.3 Condition of supply and scope of mechanical tests for finished chain cables and fittings

Grade	Manufacturing method	Condition of supply	Number of test specimens on every four lengths of chain cable of 27,5 m or less, or on each batch of fittings		
			Tensile test on base materials	Charpy V-notch impact test	
				Base material	Weldment
U1 cable	Flash butt welded	As welded Normalised	— —	— —	— —
U2 cable	Flash butt welded	As welded Normalised	1 —	3 —	3 —
U3 cable	Flash butt welded	Normalised Normalised and Tempered Quenched and Tempered	1	3	3
U2 cable	Cast or drop forged	Normalised	1	3	—
U3 cable	Cast or drop forged	Normalised Normalised and Tempered Quenched and Tempered	1	3	—
U2 fittings	Cast or drop forged	Normalised	1	3	—
U3 fittings	Cast or drop forged	Normalised Normalised and Tempered Quenched and Tempered	1	3	—

Equipment for Mooring and Anchoring

Chapter 10

Section 2

2.5.5 One tensile and three Charpy V-notch specimens are to be taken from each test sample.

2.5.6 The results of mechanical tests are to comply with the requirements of Table 10.2.1 for the relevant grade.

2.6 Stud material

2.6.1 Steel studs are to be used for all grades of welded chain cable. In general, the carbon content should not exceed 0.23 per cent but mechanical tests for acceptance purposes are not required.

2.7 Welding of studs

2.7.1 Where studs are welded into the links this is to be completed before the chain cable is heat treated.

2.7.2 The stud ends must be a good fit inside the link, and the weld is to be confined to the stud end opposite the flash-butt weld. The full periphery of the stud end is to be welded. If, however, it can be demonstrated to the Surveyor that the quality of welding is of a high standard then partial peripheral welding may be accepted provided that welds are made only at the sides of the stud and that each run extends continuously for at least 25 per cent of the stud periphery.

2.7.3 The welds are to be made by qualified welders using an approved procedure and consumables approved to Grade 3 and low hydrogen.

2.7.4 The welds are to be of good quality and free from defects liable to impair the proper use of the chain. Undercuts, end craters and similar defects shall, where necessary, be ground off.

2.7.5 At least one stud weld within each length of cable is to be inspected using dye penetrant testing after the chain has been proof loaded. If a crack is found, the stud welds in the adjoining links are to be inspected; if a crack is found in either link, all the stud welds in that length are to be inspected using dye penetrant.

2.8 Heat treatment of completed chain cables

2.8.1 The completed chain cable is to be heat treated in accordance with Table 10.2.3 for the appropriate grade of cable.

2.8.2 Special consideration will be given to the heat treatment of certain types of drop forged chain cable.

2.8.3 In all cases, heat treatment is to be carried out prior to the proof loading and breaking tests.

2.8.4 All test samples are to be heat treated with, and in the same way as, the chain cables they represent.

2.9 Testing of completed chain cables

2.9.1 All chain cables are to be subjected to a Proof Load test and a Breaking Load test. In addition, mechanical tests should be carried out where required, see Table 10.2.3.

2.9.2 All chain cables are to be tested in the presence of a Surveyor, at a proving establishment recognised by LR. A list of recognised proving establishments is published separately by LR. In addition to the requirements stated in this Chapter, attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

2.10 Proof load tests

2.10.1 Each length of chain cable is to be subjected to a proof loading test in an approved testing machine and is to withstand the load given in Table 10.2.4 for the appropriate grade and size of cable.

2.10.2 For test purposes, the cable is to be clean and free from paint and anti-corrosive coatings.

2.10.3 On completion of the test, each link is to be visually examined and is to be free from significant defects. Special attention is to be given to welds.

2.10.4 Should any link be found to be defective it is to be replaced by an approved connecting link (joining shackle or substitute link as detailed in 2.14). The chain is then to be subjected to a repeat of the proof load test followed by re-examination.

2.10.5 If a link breaks during proof load testing, a sample consisting of three common links is to be taken from each side of the broken link and subjected to a breaking test as detailed in 2.10. If either of these samples fails, the length of cable is not to be accepted. A thorough examination of all broken links is to be made to determine the cause of failure and, after evaluation, LR will consider the extent of cable which is to be rejected.

2.11 Breaking load tests

2.11.1 Breaking load tests are to be carried out on three-link samples selected by the Surveyor from the completed (including heat treatment) chain. The test links may be removed from the chain prior to heat treatment provided that each sample is heat treated with, and in the same manner as the chain it represents. They are to be properly identified with the lengths of chain they represent.

2.11.2 The number of tests required is to be in accordance with Table 10.2.5 except that for chafing chain for Emergency Towing Arrangements (ETA), see Pt 3, Ch 13.9.2, one test is to be carried out on each 110 m of finished chains.

Chapter 10

Section 2

Table 10.2.5 Number of breaking tests from completed cables

Designation	Method of manufacture	Number of breaking test specimens
Grade U1	Flash-butt welded and heat treated	One from every four lengths of 27,5 m or less
Grade U2(a) U3(a)	Flash-butt welded, or drop forged and heat treated	One from every four lengths of 27,5 m or less
Grade U1 U2(a)	Flash-butt welded but not heat treated	One from each length of 27,5 m or less
Grade U2(b) U3(b)	Cast and heat treated	One per heat treatment batch with a minimum of one from every four lengths of 27,5 m or less

Table 10.2.6 Mechanical properties of welds in chain cables

Grade	Charpy V-notch impact test	
	Test temperature °C	Average energy J min
U1 U2	— 0 (see Note 1)	— 27
U3	0 –20 (see Note 2)	50 27
NOTES 1. Impact tests are only required if the chain cable is not heat treated. 2. Impact testing may be carried out at 0°C or minus 20°C.		

2.11.3 Breaking test specimens are to withstand the load given in Table 10.2.4 for the appropriate grade and size of cable. The specimen is considered to have passed this test if it has shown no sign of fracture after application of the required load for a minimum of 30 seconds.

2.11.4 Where a breaking test specimen fails, a further specimen is to be cut from the same length of cable and subjected to test. If this re-test fails, the length of cable from which it was taken is to be rejected. When this test is also representative of other lengths, each of the remaining lengths is to be individually tested by taking a breaking test specimen from each length of the batch. If one of these further tests fails, the entire set of lengths represented by the original test is to be rejected.

2.11.5 For large diameter cables where the required breaking load is greater than the capacity of the testing machines, special consideration will be given to acceptance of an alternative testing procedure.

2.12 Dimensional inspection

2.12.1 After proof testing, the entire chain is to be checked for length, five links at a time with an overlap of two links, to ensure that the chain meets the tolerances given in 2.15.4. The measurements are to be made while the chain is loaded to about 10 per cent of the proof load.

2.12.2 The links held in the end blocks may be excluded from these measurements.

2.12.3 If a five link length of chain exceeds the tolerance given in 2.15.4, the oversize links are to be removed and an approved connecting link inserted.

2.12.4 Checks of all other dimensions are to be made on three links, selected by the Surveyor, from every four 27,5 m lengths.

2.12.5 If one of the links detailed in 2.12.4 fails to comply with the required tolerances, measurements are to be made on a further five links in every four 27,5 m lengths.

2.12.6 If more than one link in a 27,5 m length of chain cable fails to meet the tolerance requirements, all the links in that length are to be measured.

2.12.7 All links failing to comply with the maximum dimensional tolerances are to be removed and replaced by connecting links of an approved type. The chain is then to be subjected to a further proof load test and re-examined.

2.13 Fittings for chain cables

2.13.1 Cable fittings are to be manufactured at an approved works.

2.13.2 The materials from which the fittings are made are to be manufactured at approved works, in accordance with the appropriate requirements of Ch 4,1 or Ch 5,1 respectively. Alternative arrangements may be agreed provided that full details concerning the manufacturer are submitted to LR.

2.13.3 All fittings are to be manufactured to an approved manufacturing specification, and provision is to be made for tensile specimens and, where applicable, impact test specimens, see Table 10.2.3. The test samples are to be prepared in accordance with 2.4.3 or 2.5.4 as applicable. The test specimens are to be subjected to heat treatment with the fittings they represent. The mechanical test requirements are the same as those for the relevant grade of chain cable, see Table 10.2.1. A batch of fittings is to be of the same grade, size and heat treatment charge and to have originated from a single cast of steel. Enlarged and end links need not be tested provided that they are manufactured and heat treated together with the chain cable.

2.13.4 Fittings such as shackles, swivels and swivel shackles are to be forged or cast in steel of at least Grade U2. The welded construction of fittings may also be approved providing that full details of the manufacturing process and the heat treatment are submitted.

Equipment for Mooring and Anchoring

Chapter 10

Section 2

2.13.5 All chain cable accessories, including spares, are to be subjected to the proof loads appropriate to the grade and size of cable for which they are intended. These include shackles, swivels, swivel shackles, enlarged links and end links. Anchor shackles, however, are to be tested in combination with the anchor, see 1.3.9.

2.13.6 The appropriate breaking load is to be applied for a minimum of 30 seconds to at least one item out of every batch of up to 25 (1 in 50 for lugless (Kenter) shackles), and this item is to be destroyed and not used as part of an outfit. For the purpose of break load testing, a batch of accessories is to be of the same grade, size and heat treatment charge and may consist of items from different casts, provided that the sample tested is from the cast with the lowest tensile properties. Enlarged and end links need not be tested provided that they are manufactured and heat treated together with the chain cable.

2.13.7 If the sample fails to withstand the breaking load without fracture, two more samples from the same batch may be tested. If either of these samples fails, the batch is to be rejected.

2.13.8 Where the items are of increased dimensions, and have been specially approved, or if material of a higher grade than is specified is used the breaking load may be applied to each item, and the items so tested included with the outfit. For the purpose of this paragraph, items of increased dimensions are those so designed that their breaking strength is not less than 1,4 times the Rule minimum breaking load of the chain cable with which they are to be used.

2.13.9 LR may waive the breaking load test provided that:

- (a) the breaking load test has been completed satisfactorily during approval testing, and
- (b) the tensile and impact properties of each manufacturing batch are proved and
- (c) the accessories are subjected to suitable non-destructive testing.

2.13.10 All testing is to be carried out in the presence of the Surveyor and to his satisfaction.

2.13.11 All fittings are to be stamped in accordance with 2.16.

2.14 Substitute single links

2.14.1 Single links to connect lengths of chain cable or to substitute for defective links, without the necessity for re-heat treatment of the whole cable length, are to be made by the chain manufacturer in accordance with an approved procedure. Separate approvals are required for each grade of chain cable and the tests are to be made on the maximum size of chain for which approval is sought. Re-approval is required annually.

2.14.2 Manufacture and heat treatment of the substitute link are not to affect the strength of the adjoining links. The temperature reached by these links is nowhere to exceed 250°C.

2.14.3 The steel bar used is to conform with the specification for the chain in accordance with Ch 3,9.

2.14.4 Details of the method of manufacture, including heat treatment, are to be submitted for approval, together with the results of a series of tests laid down by LR.

2.14.5 All links involved in the approval tests are to be destroyed and are not to be used as part of a chain cable.

2.14.6 Every substitute link included in a chain cable is to be subjected to the proof load appropriate to the grade and size of chain in which it is incorporated, as detailed in Table 10.2.4.

2.14.7 Each substitute link is to be stamped on the stud with the identification marks listed in 2.16.1 plus a unique number for the link. The adjoining links are also to be stamped on the studs.

2.15 Dimensions and tolerances

2.15.1 The form and proportion of links and shackles are to be in accordance with ISO/1704-1991, see Figs. 10.2.1 to 10.2.6.

2.15.2 Manufacturing tolerances on stud link chain are to be within $\pm 2,5$ per cent (taking into account that all components of the chain are to be a good fit with one another), except for those detailed in 2.15.3.

2.15.3 The cross-sectional area at the crown of the link is to have no negative tolerance. The negative tolerance on the diameter at the crown measured in the plane of the link is not to exceed:

- Minus 1 mm when $d_c \leq 40$ mm
- Minus 2 mm when $40 \text{ mm} < d_c \leq 84$ mm
- Minus 3 mm when $84 \text{ mm} < d_c \leq 122$ mm
- Minus 4 mm when $d_c > 122$ mm

The plus tolerance on the diameter at the crown measured out of the plane of the link is not to exceed 5 per cent. The cross-sectional area is to be calculated using the average of the diameter measured in the plane of the link d_c , see Fig. 10.2.1, and the diameter measured perpendicular to the plane of the link, d_p .

2.15.4 The diameter measured at locations other than the crown is to have no negative tolerance. The plus tolerance is to be in accordance with Table 3.9.3 of Chapter 3 except at the butt weld where it is to be in accordance with the manufacturer's specification, which is to be agreed by LR.

2.15.5 The maximum allowable tolerance on a length of five links measured in accordance with 2.12.1 is plus 2,5 per cent. No under-tolerance is permitted.

Equipment for Mooring and Anchoring

Chapter 10

Section 2

Fig. 10.2.6 Lugless shackle

2.15.6 All measurements are to be made on links selected by the Surveyor and are to be carried out to the Surveyor's satisfaction.

2.15.7 Studs are to be located in the links centrally, and at right angles to the sides of the link, although the studs of the final link at each end of any length may also be located off-centre to facilitate the insertion of the joining shackle. The following tolerances are acceptable provided that the stud fits snugly and its ends lie flush against the inside of the link:

Maximum off-centre distance X : 10 per cent of the nominal diameter, d

Maximum deviation, a from the 90° position: 4° .

The tolerances are to be measured in accordance with Fig. 10.2.7.

2.15.8 The following tolerances are applicable to accessories:

Nominal diameter: plus 5 per cent, minus 0 per cent

Other dimensions: $\pm 2,5$ per cent.

2.15.9 For lugless shackles of the Kenter type, the radii indicated in Fig. 10.2.8 are to be not less than 0,03 times the chain diameter.

Fig. 10.2.7 Stud dimensions

Fig. 10.2.8 Lugless shackle of the Kenter type

2.15.10 All materials are to be free from internal and surface defects that might impair proper workability, use and strength. Subject to agreement by the Surveyor, surface defects may be removed by grinding provided the acceptable tolerances are not exceeded.

Equipment for Mooring and Anchoring

Chapter 10

Sections 2 & 3

2.16 Identification

2.16.1 All lengths of Grades U1, U2 and U3 cable and all fittings are to be stamped with the following identification marks:

- (a) LR or Lloyd's Register and abbreviated name of LR's local office issuing the certificate.
- (b) Number of certificate.
- (c) Proof load and grade of chain.

2.17 Certification

2.17.1 Certificates may be issued for chain cable only, fittings only or chain cable with associated fittings.

2.17.2 The test certificate is to include the following particulars for all items included on the certificate:

- (a) Purchaser's name and order number.
- (b) Description and dimensions.
- (c) Grade of chain cable.
- (d) Identification mark which will enable the full history of the chain or fitting to be traced.
- (e) Chemical composition.
- (f) Details of heat treatment.
- (g) Mechanical test results.
- (h) Breaking test load.
- (i) Proof load.

2.17.3 Where appropriate, the certificate is to include a list of all substitute links together with their grade of steel, the name of the steelmaker, the heat number and the purchase order number.

Section 3 Stud link mooring chain cables

3.1 Scope

3.1.1 Provision is made in this Section for three grades, R3, R3S and R4, of stud link chain intended for offshore mooring applications such as mooring of mobile offshore units, offshore loading systems and gravity based structures during fabrication.

3.1.2 In addition, chain cable conforming to the requirements of the current edition of API specification 2F is acceptable provided that it has been manufactured, inspected and tested under Survey by LR, and that the bar stock has also been certified by LR in accordance with Ch 3,9.

3.2 Manufacture

3.2.1 All grades of chain cable and accessories are to be manufactured by approved procedures at works approved by LR. A list of approved manufacturers for stud link chain cables is published separately by LR.

3.2.2 The works in which the chain is manufactured is to have a quality system approved by LR. The provision of such a quality system is required in addition to and not in lieu of the witnessing of tests by a Surveyor.

3.2.3 Approval is confined to a single works and is limited to one grade of cable made from bar from a nominated and approved supplier. Separate approvals are required if steel bar is supplied from more than one works and for other grades of cable, see also Ch 3,9.

3.2.4 Drawings showing the detailed design of the chain and accessories made by or supplied through the chain manufacturer are to be submitted for approval. These are to include details showing the design of the studs.

3.2.5 Details of the method of manufacture and the specification of the steel, are to be submitted.

3.2.6 Offshore mooring chains are to be made in continuous lengths by flash-butt welding.

3.2.7 Bar material may be heated either by electric resistance or in a furnace. For electrical resistance heating, the process is to be controlled by an optical heat sensor. For furnace heating, thermocouples in close proximity to the bars are to be used for control and the temperature is to be continuously recorded. In both cases, the controls are to be checked at least once every eight hours and records taken.

3.2.8 The following welding parameters are to be controlled during welding of each link:

- (a) platen motion,
- (b) current as a function of time.

The controls are to be checked at least once every four hours.

3.2.9 The records of bar heating, flash-butt welding and heat treatment are to be made available to the Surveyor when required.

3.2.10 As far as practicable, consecutive links in all chain cable should originate from a single batch of bar stock (see Ch 3,9.6.1) and indicating marks should be stamped on the final link formed from one batch and the first link formed from a separate batch.

3.2.11 Dimensions and tolerances are to comply with 2.15.

3.3 Studs

3.3.1 The studs are to be made of steel corresponding to that of the chain or in compliance with a specification approved by LR. In general, the carbon content should not exceed 0,23 per cent if the studs are to be welded in place.

3.3.2 Studs may be welded into grade R3 and R3S chains. The welding of studs into grade R4 chain is not permitted unless especially approved.

3.3.3 In all cases where studs are welded into links, this is to be carried out in accordance with 2.6.

Equipment for Mooring and Anchoring

Chapter 10

Section 3

3.3.4 The size of the stud welds is to be in accordance with Fig. 10.3.1.

3.3.5 All stud welds are to be visually inspected. At least 10 per cent of all stud welds within a 100 m length are to be examined by dye penetrant or magnetic particle inspection after proof load testing. Cracks or lack of fusion are not acceptable; if any such defects are found, all stud welds in that 100 m length are to be examined by means of dye penetrant or magnetic particle inspection.

3.3.6 Where plastic straining is used to set studs, the applied load is not to be greater than that qualified in approval tests. The combined effect of shape and depth of the impression of the stud in the link is not to cause any harmful notch effect or stress concentration.

3.4 Heat treatment of completed chain cables

3.4.1 The chain is to be normalised, normalised and tempered or quenched and tempered in accordance with the specification approved by LR.

3.4.2 The chains are to be heat treated in a continuous furnace; batch heat treatment is not permitted.

3.4.3 The temperature and time, or chain speed, are to be controlled and continuously recorded.

3.4.4 Heat treatment is to be carried out prior to the proof loading and breaking tests.

3.4.5 Calibration of furnaces is to be verified by measurement and recording of actual link temperature (surface and internal).

3.5 Testing of completed chain cables

3.5.1 The entire length of chain cable is to be subjected to a proof loading test in an approved testing machine and is to withstand the load given in Table 10.3.1 for the appropriate grade and size of cable.

3.5.2 Care should be taken to obtain a uniform stress distribution in the links being tested.

3.5.3 The chain is to be shot blasted in order to ensure that its surfaces are free from scale, paint or other coating for inspection. This may be immediately before or after proof loading at the discretion of the manufacturers.

3.5.4 On completion of the proof load test, each link is to be visually examined and is to be free from significant defects such as mill defects, surface cracks, dents and cuts, especially where gripped by clamping dies during flash butt welding. Studs are to be securely fastened and any burrs, irregularities and rough edges are to be removed by careful grinding.

3.5.5 All flash butt welds, including the area gripped by the clamping dies are to be examined by magnetic particle inspection. The area is to be free from cracks, lack of fusion and gross porosity.

3.5.6 Surface defects in the region of the flash butt welds may be removed by grinding, provided that the depth of grinding does not exceed five per cent of the link diameter and is smoothly contoured into the surrounding material. The final dimensions are still to conform with the agreed standard.

3.5.7 All flash butt welds are also to be examined by ultrasonic inspection and are to be free from defects such as internal cracks or lack of fusion.

3.5.8 After proof testing, the entire chain is to be checked for length, five links at a time with an overlap of two links, to ensure that the chain meets the tolerances given in 2.15.5. The measurements are to be made while the chain is loaded to about 10 per cent of the proof load.

3.5.9 The links held in the end blocks may be excluded from these measurements.

3.5.10 If the length over five links is less than the nominal, the chain may be stretched by loading above the specified proof test load provided that the applied load is not greater than that approved and that only random lengths of the chain need to be stretched.

3.5.11 Checks of all other dimensions are to be made on at least five per cent of the links in the cable.

3.5.12 If any link fails to meet the dimensional tolerance requirements (see 2.15), measurements are to be made on 20 more links on each side of the incorrect one. If failure to meet any particular dimensional requirements occurs in more than two of the measured links, then all the links are to be dimensionally checked.

152	10890	11480	16410	13240	12820	18320	15890	14110	20160
157	11470	12100	17280	13950	13510	19300	16740	14860	21230
162	12060	12720	18170	14660	14200	20280	17600	15620	22320

3.5.13 Should any link be found to be defective or fail to meet the dimensional tolerance requirements or if a five link length of chain exceeds the specified tolerance, the unsatisfactory links are to be removed from the chain, and connecting common links complying with the requirements of 3.6 inserted in their places.

3.5.14 The chain is then to be subjected to a further proof load test and re-examined.

3.5.15 The number of connecting common links which may be used to replace defective links is not to exceed three in any 100 m length of chain. The number and type of joining shackles which may be used are to be subject to the written agreement of the end user.

3.5.16 If a link breaks during proof load testing, a sample consisting of three common links is to be taken from each side of the broken link and subjected to a breaking test as detailed in 3.5.17 and 3.5.18. If either of these samples fails, the proof loaded length of cable is not to be accepted. A thorough examination of all broken links is to be made to determine the cause of failure and, after evaluation, LR will consider the extent of cable which is to be rejected and also the possibility that similar factors to those which caused the failure may also be present in other parts of the cable.

Equipment for Mooring and Anchoring

Chapter 10

Section 3

3.5.17 In addition to the requirements of 3.5.1, three link samples are to be selected by the Surveyors from the completed chain for breaking tests. The number of tests required is to be in accordance with Table 10.3.2. Extra links are to be provided for the mechanical tests detailed in 3.5.21. All test links are to be made as part of the chain cable and are to be heat treated with it. These may be removed from the cable prior to heat treatment provided that each sample is heat treated with, and in the same manner as, the chain it represents and is subjected to the proof load appropriate to the chain grade and diameter prior to selection of the mechanical test specimens. They are to be properly identified with the length of chain they represent.

Table 10.3.2 Frequency of break and mechanical tests

Nominal chain diameter mm	Maximum sampling interval m (See Note)
Min. — 48	91
49 — 60	110
61 — 73	131
74 — 85	152
86 — 98	175
99 — 111	198
112 — 124	222
125 — 137	250
138 — 149	274
150 — 162	297
163 — 175	322
NOTE If the sampling interval contains links made from more than one cast, extra break and mechanical tests are required so that tests are made on every cast.	

3.5.18 Breaking test specimens are to withstand the load given in Table 10.3.1 for the appropriate grade and size of cable for a period of 30 seconds. The specimen is considered to have passed this test if it has shown no sign of fracture after application of the required load.

3.5.19 If a breaking test specimen fails, two further specimens are to be cut from the same sampling length and both are to be subjected to the breaking test load. If one of the re-test specimens fails the length is to be rejected. All the broken links are to be subjected to an investigation into the cause of failure. LR will then decide which lengths of chain can be accepted and on further action.

3.5.20 For large diameter cables where the required breaking load is greater than the capacity of the testing machines, special consideration will be given to acceptance of an alternative testing procedure.

3.5.21 One tensile and three sets of Charpy V-notch impact test specimens are to be taken from links cut from the heat treated and proof loaded chain at intervals no greater than those indicated in Table 10.3.2 provided that every cast is sampled. The tensile specimen and one set of impact specimens are to be taken from the side of the link opposite the weld. One set of impact test specimens is to have the notches positioned at the centre of the flash butt weld and the third set is to be taken from the bend. All the specimens are to be taken from positions in accordance with Fig. 3.1.1(f) in Chapter 3.

3.5.22 The frequency of testing at the link bends may be reduced at the discretion of LR provided it can be verified that the required toughness is achieved consistently.

3.5.23 The results of the mechanical tests are to comply with the requirements of Table 10.3.3.

Table 10.3.3 Mechanical properties of chain cable materials

Grade	Yield stress N/mm ² minimum	Tensile strength N/mm ²	Elongation % minimum	Reduction of area % minimum (See Note 3)	Charpy V-notch impact tests		
					Test temperature °C	Average energy J minimum	Average energy flash weld J minimum
R3	410 (See Note 1)	690 minimum (See Note 1)	17	50	0 –20 (See Note 2)	60 40	50 30
R3S	490 (See Note 1)	770 minimum (See Note 1)	15	50	0 –20 (See Note 2)	65 45	53 33
R4	580 (See Note 1)	860 minimum (See Note 1)	12	50	–20	50	36
NOTES 1. The ratio of yield strength to tensile strength should not exceed 0,92. 2. Testing may be carried out at either 0°C or –20°C. 3. For cast accessories, the minimum values for reduction of area are to be 40% for Grades R3 and R3S and 35% for Grade R4.							

Equipment for Mooring and Anchoring

Chapter 10

Section 3

3.5.24 If the tensile test requirements are not achieved, two further specimens from the same sample are to be tested. The related length of chain will be considered acceptable if both re-test specimens meet the requirements but failure of either of the re-test specimens will result in rejection of the sampling length of chain represented by the tests.

3.5.25 If the impact test requirements are not achieved, re-tests may be carried out in accordance with Ch 1,2.4. Failure to meet the re-test requirements will result in rejection of the sampling length of chain represented by the tests.

3.6 Connecting common links or substitute links

3.6.1 Single links to connect lengths of heat treated chain cable or to substitute for test links or defective links without the necessity for re-heat treatment of the whole length of cable are to be made by the chain manufacturer in accordance with an approved procedure. Separate approvals are required for each grade of chain cable and tests are to be made on the maximum size of chain for which approval is sought.

3.6.2 Manufacture and heat treatment of the connecting common link is not to affect the strength of the adjoining links. The temperature reached by these links is nowhere to exceed 250°C.

3.6.3 The steel bar used is to conform with the specification for the chain and approved by LR in accordance with Ch 3,9.

3.6.4 Details of the method of manufacture, including heat treatment, are to be submitted for approval, together with the results of a series of tests laid down by LR.

3.6.5 All links involved in the approval tests are to be destroyed and are not to be used as part of a chain cable.

3.6.6 Every connecting common link included in a chain cable is to be subjected to the proof load appropriate to the grade and size of chain in which it is incorporated as detailed in Table 10.3.1.

3.6.7 Every connecting common link is to be inspected in accordance with 3.5.4 to 3.5.7.

3.6.8 A second identical link is to be made for mechanical tests which are to be in accordance with 3.5.21. This test link is also to be inspected in accordance with 3.6.7.

3.6.9 Each connecting common link is to be stamped on the stud with the identification marks listed in 3.8.1 plus a unique number for the link. The adjoining links are also to be stamped on the studs.

3.7 Fittings for offshore mooring chain

3.7.1 Cable fittings are to be manufactured at an approved works.

3.7.2 The materials from which the fittings are made are to be manufactured at approved works, in accordance with the appropriate requirements of Ch 4,1 or Ch 5,1. Alternative arrangements may be agreed provided that full details concerning the manufacturer are submitted to LR.

3.7.3 All fittings are to be manufactured to a manufacturing specification approved by LR, and provision is to be made for tensile and impact test specimens. The test samples are to be subjected to heat treatment with the fittings they represent. The mechanical test requirements are the same as those for the relevant grade of chain cable, see Table 10.3.3, except that for castings the minimum required Reduction of Area is 40 per cent for Grades R3 and R3S and 35 per cent for Grade R4.

3.7.4 Manufacturers intending to supply accessories in the machined condition (e.g. Kenter type shackles) are to submit detailed drawings for approval by LR.

3.7.5 All chain cable accessories, including spares, are to be subjected to the proof loads appropriate to the grade and size of cable for which they are intended, see Table 10.3.1. Prior to this test, the accessories are to be shot or sand blasted to ensure that their surfaces are free from scale, paint or any other coating which could interfere with any subsequent inspection.

3.7.6 The proof load test is to be carried out in the presence of the Surveyor but if the manufacturer has a procedure for recording proof loads and the Surveyor is satisfied with the adequacy of the recording system, he need not witness all proof load tests.

3.7.7 The appropriate breaking load as required by Table 10.3.1 is to be applied to at least one item out of every batch of up to 25, and this item is to be destroyed and not used as part of an outfit. A batch of accessories is to be of the same grade, size and heat treatment charge and to have originated from a single cast of steel.

3.7.8 If the sample fails to withstand the breaking load without fracture, two more samples from the same batch may be tested. If either of these samples fails, the batch is to be rejected.

3.7.9 For very large fittings where the required breaking load is greater than the capacity of the testing machine and for individually produced accessories or accessories produced in small batches, proposals for an alternative method of testing will be given special consideration.

3.7.10 At least one accessory from each batch is to be checked dimensionally after proof load testing. The manufacturer is to provide a statement that the dimensions comply with the specified requirements.

3.7.11 All accessories are to be subjected to close visual examination after proof load testing, particular attention being paid to machined surfaces and highly stressed regions. All accessories are also to be examined by magnetic particle or dye penetrant inspection and ultrasonic testing. The manufacturer is to provide a statement that the non-destructive examination has been carried out with satisfactory results.

Equipment for Mooring and Anchoring

Chapter 10

Sections 3 & 4

3.7.12 In the event of a failure of any test, the entire batch is to be rejected unless the cause of failure has been determined and it can be demonstrated that the condition causing failure is not present in any of the other accessories in the batch.

3.7.13 Except as indicated in 3.7.6, all testing is to be carried out to the satisfaction and in the presence of the Surveyor.

3.8 Identification

3.8.1 Each length of chain is to be permanently marked with the following:

- (a) LR and abbreviated name of LR's local office issuing the certificate.
- (b) Certificate number (this may be abbreviated provided it is stated in the certificate).
- (c) Grade and proof load of chain.

3.8.2 The chain is to be marked as follows:

- (a) at each end (the marking should identify the leading and tail end of each chain),
- (b) at intervals not exceeding 100m,
- (c) on all connecting common links or shackles and the immediately adjacent links,
- (d) on the first and last common link of each individual charge used in the continuous length.

3.8.3 All identification marks are to be made on the studs and are to be permanent and legible throughout the expected service life of the chain.

3.9 Certification

3.9.1 Individual certificates are to be issued for each continuous single length of chain.

3.9.2 The test certificate is to include the following particulars:

- (a) Purchaser's name and order number.
- (b) Description and dimensions.
- (c) Grade of chain cable.
- (d) Identification mark which will enable the full history of the chain to be traced.
- (e) Chemical composition.
- (f) Details of heat treatment.
- (g) Mechanical test results.
- (h) Breaking test load.
- (j) Proof load.
- (k) The number and locations of all connecting common links and all marked links.

3.10 Documentation

3.10.1 A complete Chain Inspection and Testing Report, in booklet form, is to be provided by the chain manufacturer for each continuous chain length. It is to include all dimensional checks, test and inspection reports, non-destructive test reports, process records as well as any non-conformities together with corrective action and repair work.

3.10.2 All documents, including reports and appendices are to carry a reference to the relevant certificate number.

3.10.3 The chain manufacturer is responsible for storing all the documentation in a safe and retrievable manner for a period of at least 10 years.

3.10.4 An Inspection and Testing Report, in booklet form, is to be provided for each order. This is to include all reports of tests, inspections and dimensional measurements and all non-conformities together with corrective or repair action taken. Each type of accessory is to be covered by a separate certificate. All accompanying documents are to carry a reference to the relevant certificate number. The manufacturer is responsible for storing all documentation for a period of at least 10 years in a safe and retrievable manner.

Section 4 Studless mooring chain cables

4.1 Scope

4.1.1 Provision is made in this Section for three grades, R3, R3S and R4, of studless flash butt welded chain cable intended for long term mooring applications.

4.1.2 The chain is generally expected to be deployed only once for a pre-determined service life.

4.1.3 Each studless chain link design will require to be approved by LR. The plan submitted for this approval is to include the minimum proof and breaking test loads.

4.2 Manufacture

4.2.1 All the requirements of 3.2, with the exception of that relating to studs (3.2.4), apply to the manufacture of studless mooring chain cables.

4.3 Shape and dimensions of links

4.3.1 The shape and dimensions of the links are to be in accordance with the approved design.

4.4 Dimensional tolerances

4.4.1 The dimensional tolerances of studless links are to be in accordance with the requirements of 2.15.2 to 2.15.6.

4.5 Heat treatment

4.5.1 Heat treatment of the chain is to be in accordance with the requirements of 3.4.

Equipment for Mooring and Anchoring

Chapter 10

Sections 4 & 5

4.6 Testing of completed chain

4.6.1 The entire length of chain cable is to be subjected to a proof load test in an approved testing machine and is to withstand the load given in Table 10.3.1 for the appropriate grade and diameter of the chain, see also 4.1.3.

4.6.2 Inspection after proof load testing is to be in accordance with the requirements given in 3.5.2 to 3.5.16, excluding that related to studs in 3.5.4.

4.6.3 In addition to the inspection of the flash butt welded areas as required in 3.5.5, the surfaces of the bends of at least 10 per cent of the links are to be examined by magnetic particle inspection and are to be free from cracks or other defects.

4.6.4 If stretching of links is required in order to maintain dimensional tolerances (see 3.5.10), the load applied is not to exceed the proof load by more than 10 per cent.

4.6.5 Breaking load tests are to be carried out in accordance with 3.5.17 to 3.5.19 and Tables 10.3.1 and 10.3.2.

4.6.6 Alternative procedures to breaking load testing (see 3.5.20) are not permissible unless prior agreement is given by LR after special consideration.

4.6.7 Mechanical testing is to be carried out in accordance with 3.5.21 to 3.5.25 and Table 3.3.3.

4.7 Connecting or substitute links

4.7.1 Connecting links and substitute links are to be in accordance with the requirements of 3.6.

4.8 Fittings

4.8.1 Fittings for studless chain are to comply with the requirements of 3.7.

4.9 Identification

4.9.1 All chain is to be identified in accordance with 3.8.1 and 3.8.2.

4.9.2 Identification marks are to be made on the outside of the straight part of the link, opposite the flash butt weld.

4.10 Certification

4.10.1 Certificates are to be issued in accordance with 3.9.

4.11 Documentation

4.11.1 Documentation in accordance with 3.10 is to be provided by the manufacturer.

Section 5 Short link chain cables

5.1 Scope

5.1.1 This Section gives the requirements for electrically welded steel short link chain cable for marine use but excluding those applications covered by the *Code for Lifting Appliances in a Marine Environment*.

5.1.2 Provision is made for two grades, L(3) and M(4), as defined in ISO 1834. Allowance is also made for the requirements of ISO 4565.

5.2 Manufacture

5.2.1 Short link chain cables are to be manufactured at works approved by LR. A list of approved manufacturers for short link chain cable is published separately by LR.

5.2.2 The chain is to be supplied in either the normalised or quenched and tempered condition. Heat treatment is to be carried out prior to proof and breaking load testing.

5.2.3 The chain may be galvanised using a hot dipping process provided that this is carried out prior to proof and breaking load testing. If galvanised, it is recommended that the thickness of the zinc coating be not less than 70 microns.

5.2.4 Unless otherwise agreed, the finished chain is to be free from coatings other than zinc.

5.3 Bar material

5.3.1 Bars for the manufacture of short link chain cable are to be made and tested in accordance with the appropriate requirements of Ch 3,1 and to the requirements of an International or acceptable National Standard.

5.3.2 The bars are to be made at a works approved by LR.

5.3.3 The steel is to be fully killed and fine grain treated.

5.3.4 The steel is to have mechanical properties which will allow the chain to meet the mechanical test requirements of 5.4.7 and Table 10.5.1.

5.4 Testing and inspection of chain cables

5.4.1 All chain cable of 12,5 mm diameter and above, and all steering chains irrespective of diameter, are to be tested at a proving establishment recognised by LR. A list of recognised proving establishments is published separately by LR. In addition to the requirements stated in this Chapter, attention is to be given to any relevant statutory requirements of the National Authority of the country in which the ship or other marine structure is to be registered.

5.4.2 For chain of diameter less than 12,5 mm, other than steering chains, the manufacturer's tests will be acceptable.

Equipment for Mooring and Anchoring

Chapter 10

Section 5

Table 10.5.1 Mechanical test requirements for short link chain cables

Chain diameter mm	Grade L(3)		Grade M(4)	
	Proof load kN	Breaking load minimum kN	Proof load kN	Breaking load minimum kN
5	—	—	7,9	15,8
6	9	18	—	—
6,3	—	—	12,5	25
7,1	—	—	15,9	31,8
8	16	32	20,2	40,4
9	—	—	25,5	51
10	25	50	31,5	63
11,2	—	—	39,5	79
12	35,5	71	—	—
12,5	—	—	49,1	98,2
14	—	—	63	126
16	—	—	81	162
18	—	—	102	204
20	—	—	126	252
22,4	—	—	158	316
25	—	—	197	394
28	—	—	247	494
32	—	—	322	644
36	—	—	408	816
40	—	—	503	1006
45	—	—	637	1274

5.4.3 After completion of all manufacturing processes, including heat treatment and galvanising, the whole of the chain is to be subjected to the appropriate proof load specified in Table 10.5.1.

5.4.4 The whole of the chain is to be inspected after the proof load test and is to be free from significant defects.

5.4.5 At least one sample, consisting of seven or more links, is to be selected by the Surveyor from each 200 m or less of chain for breaking load tests. Two additional links may be required for engagement in the jaws of the testing machine. These extra links are not to be taken into account in determining the total elongation, see 5.4.7.

5.4.6 The breaking load is to comply with the appropriate requirements of Table 10.5.1.

5.4.7 The total elongation of the breaking load sample at fracture, expressed as a percentage of the original inside length of the sample after proof loading, is to be not less than 20 per cent.

5.5 Dimensions and tolerances

5.5.1 The form and proportions of links are to be in accordance with Fig. 10.5.1.

Fig. 10.5.1 Form and proportions of links

5.5.2 Manufacturing tolerances are to be within the following limits:

Nominal diameter, d_n	$\pm 5\%$
Pitch of chain, p_1	$\pm 3\%$
Length measured over 11 links, l	$\pm 2\%$
Inside width, w_1	1,35 d_n minimum
Outside width, w	3,6 d_n maximum

The tolerances are to apply after galvanising. All measurements are to be taken after proof testing.

5.6 Identification

5.6.1 All lengths of cable are to be stamped with the following identification marks:

- Inspector's mark and date.
- Reference mark or number of certificate.
- Manufacturer's mark or name.
- Chain cable quality mark.

Item (d), which shall be either L or M as appropriate, is to be stamped on at least each twentieth link or at intervals of one metre, whichever is the lesser distance.

5.6.2 Where the inspection is performed under LR's supervision, the inspector's mark and date are to be replaced by LR and the abbreviated name of LR's local office issuing the certificate.

5.7 Certification

5.7.1 The manufacturer is to supply the Surveyor with a certificate stating compliance with an appropriate ISO standard, and also, in the event of the requirements of 5.4 being undertaken other than in the presence of the Surveyor, stating that the test and inspection requirements have been complied with at a recognised proving establishment.

Equipment for Mooring and Anchoring

Chapter 10

Sections 5 & 6

5.7.2 The certificate is also to include:

- (a) the quality and description of chain,
- (b) identification mark,
- (c) nominal size of chain,
- (d) proof load,
- (e) breaking load,
- (f) total elongation at fracture,
- (g) where appropriate, the name of the proving establishment.

Section 6 Steel wire ropes

6.1 Scope

6.1.1 Provision is made in this Section for the requirements for the manufacture, testing and certification of steel wire ropes intended to be used for general marine purposes, as well as permanent anchoring, mooring and marine lifting applications.

6.2 General requirements

6.2.1 For general marine purposes, such as stream wires, towlines and ship mooring lines, the construction is to be in accordance with Table 10.6.1. The construction, diameter and strength of steel wire ropes for permanent offshore applications, such as mooring, anchoring and lifting, are covered by other LR Rules. Alternative applications of wire ropes may be accepted, subject to special consideration.

6.2.2 The manufacturer's plant and method of production are to be approved by LR. A list of approved manufacturers of steel wire ropes is published annually in the *List of Approved Manufacturers of Materials*.

6.2.3 For shaped wire, for example, for large diameter ropes for permanent mooring, where there are no established Standards, the manufacturer is to provide evidence by way of test reports that specifications have been developed and agreed with the purchaser and LR for the purposes intended.

6.3 Steel wire for ropes

6.3.1 Steel wire is to be of homogeneous quality, uniform strength and free of defects likely to impair the manufacture and performance of the rope.

6.3.2 For all ropes, the specified minimum tensile strength of the wire is to be 1420, 1570, 1770 or 1960 N/mm². The specified minimum tensile strength of the wire is the designated grade for the rope, unless otherwise defined by the purchaser's specification. The actual tensile strength of the wire is not to exceed 120 per cent of the specified minimum tensile strength.

6.3.3 For new rope construction, the manufacturer is to carry out prototype testing suitable for the application of the rope and this is to include tests on wire used for the construction.

6.3.4 Tensile and torsion tests, coating, and adhesion (wrap) tests are to be carried out on wire used for the manufacture of rope.

6.3.5 At least 10 per cent of the spools used for the manufacture of the strand are to be tested. The manufacturer is to demonstrate that tests have been carried out on at least one wire intended for each of the outer and inner strands, and for each diameter and grade used.

6.3.6 The heat number, wire diameter and strength of wire used for a particular construction are to be recorded by the manufacturer.

6.3.7 Torsion tests are to be carried out on the wire by causing one or both of the securing vices to be revolved until fracture occurs (a tensile load not exceeding two per cent of the breaking load of the wire may be applied to keep the wire stretched).

6.3.8 The uncoated wire is to withstand, without fracture, the number of complete twists given for Grades 1 or 3 in Table 10.6.2.

6.3.9 The galvanised wire is to withstand, without fracture, the number of complete twists given in the specification, as agreed with the purchaser and LR. In the absence of a suitable specification, the results are to comply with Table 10.6.2.

Table 10.6.1 Recommended rope construction

Purpose	Construction of rope			Construction of strands
	Strands	Wires	Core	
Stream wires, towlines and mooring lines	6	24	Fibre	15 over 9 over fibre core
	6	37	Fibre	18 over 12 over 6 over 1
	6	26	Fibre	10 over (5 + 5) over 5 over 1
	6	31	Fibre	12 over (6 + 6) over 6 over 1
	6	36	Fibre	14 over (7 + 7) over 7 over 1
	6	41	Fibre	16 over (8 + 8) over 8 over 1
	6	30	Fibre	18 over 12 over fibre core
Towlines and mooring lines used in association with mooring winches	6	31	7 x 7 wire rope	12 over (6 + 6) over 6 over 1
	6	36	7 x 7 wire rope	14 over (7 + 7) over 7 over 1
	6	41	7 x 7 wire rope	16 over (8 + 8) over 8 over 1

Equipment for Mooring and Anchoring

Chapter 10

Section 6

Table 10.6.2 Torsion test

Diameter coated wire mm	Minimum number of twists					
	Grade 2		Grade 1 or 3			
	Minimum strength N/mm ²		Minimum strength N/mm ²			
	1570	1770	1420	1570	1770	1960
<1,3	19	18	29	26	23	23
≥1,3 <2,3	18	17	26	24	21	21
≥2,3 <3,0	16	14	24	22	—	19
≥3,0 <4,0	12	10	20	18	—	17
≥4,0 <4,6	—	—	18	16	—	—
≥4,6 <5,0	—	—	16	14	—	—
≥5,0 <6,0	—	—	14	11	—	—
NOTE The minimum test length is 100d or 300 mm, where d is the wire diameter.						

6.3.10 Hot dipped galvanised steel wire is to be used for the manufacture of ropes for marine applications. Depending upon the application, the coating may comply with any of the grades in Table 10.6.3. Grades 1 and 2 are heavy coatings. Grade 3 is the minimum coating weight where the galvanising is carried out prior to final wire drawing. Uncoated wire may be considered for approved applications.

Table 10.6.3 Zinc coating

Diameter of coated wire mm	Zinc coating, minimum g/m ²		
	Grade1	Grade 2	Grade 3
≥0,20 <0,25	—	30	20
≥0,25 <0,33	—	45	30
≥0,33 <0,40	—	60	30
≥0,40 <0,50	60	75	40
≥0,50 <0,60	70	90	50
≥0,60 <0,80	85	110	60
≥0,80 <1,00	95	130	70
≥1,00 <1,20	110	150	80
≥1,20 <1,50	120	165	90
≥1,50 <1,90	130	180	100
≥1,90 <2,50	—	205	110
≥2,50 <3,20	—	230	125
≥3,20 <4,00	—	250	135

6.3.11 The mass per unit area of the zinc coating is to be determined in accordance with a recognised National or International Standard.

6.3.12 Zinc coating tests are to be carried out for each designated grade of wire. The manufacturer is to demonstrate that the coatings are continuous and uniform and suitable for the intended purpose.

6.3.13 Unless otherwise specified by the purchaser, zinc coating tests are to be carried out on the wire prior to stranding.

6.3.14 The adhesion of the coating is to be tested by wrapping the wire round a cylindrical mandrel for 10 complete turns. The ratio between the diameter of the mandrel and that of the wire is to be as in Table 10.6.4. After wrapping on the appropriate mandrel, the zinc coating is to have neither flaked nor cracked to such an extent that any zinc can be removed by rubbing with a cloth.

Table 10.6.4 Wrap test for adhesion of coating

Coating	Diameter of coated wire mm	Maximum ratio of mandrel to wire diameter
Grade 1 and 2	<1,5	4
	≥1,5	6
Grade 3	<1,5	2
	≥1,5	3

6.4 Tests on completed ropes

6.4.1 Every length of wire rope is to be subjected to a breaking strength test.

6.4.2 A sample of sufficient length is to be provided for the breaking load test. The rope ends are to be enclosed in a suitable socket. Testing is to be carried out in accordance with a recognised National or International Standard.

6.4.3 The rope may be subject to cyclic loading for bedding purposes prior to testing. The rope is to be tested at a suitable strain rate in accordance with a recognised National or International Standard.

6.4.4 The load is to be applied until one wire break is witnessed or 130 per cent of the minimum breaking load is recorded. The maximum recorded load is to be reported by the manufacturer.

6.4.5 Tests in which a breakage occurs adjacent to and as a result of damage from the grips are to be rejected, if the applied load is less than the specified minimum requirement. The rope is to be retested to withstand the agreed minimum breaking load.

6.4.6 With the exception of offshore mooring ropes, consideration may be given to determining the breaking load by summation or aggregating actual test results on individual wires, if facilities are not available for undertaking a breaking test on a production basis. A suitable spin factor or lay-up deduction allowance in accordance with a recognised National or International Standard for the applicable rope diameter, designated grade and construction is to be applied.

6.4.7 Where spin factors or lay-up deduction allowances are proposed by the manufacturer, a report on suitable cyclic load testing of prototype ropes of the same construction, strength and diameter is to be approved by LR. In addition, the manufacturer is to show that a satisfactory breaking load test has been carried out in the previous two years, and witnessed by LR for the same rope construction, diameter and designated grade.

Equipment for Mooring and Anchoring

Chapter 10

Sections 6 & 7

6.4.8 LR may give special consideration to spin factors or lay deductions based on data extrapolated from smaller diameter ropes of the same construction, provided that these ropes have been tested in accordance with 6.4.7.

6.4.9 All data arising from smaller diameter ropes for the extrapolation in 6.4.8 are to have been derived from tests carried out within two years of the manufacture of the larger diameter rope.

6.4.10 The finished rope is to have no more than one wire connecting weld in any length of $18d$, where d is the diameter of the rope.

6.5 Inspection

6.5.1 A report on dimensional and visual examination is to be presented to the Surveyor by the manufacturer. The dimensions and discard criteria are to comply with an agreed National or International Standard.

6.5.2 Visual and dimensional checks are to be carried out in the presence of the Surveyor.

6.6 Identification

6.6.1 All completed ropes are to be identified with attached labels detailing the rope type, diameter and length.

6.7 Certification

6.7.1 The manufacturer's certificate may be accepted. The certificate is to be validated by the manufacturer's representative, who is to be independent of the production process and LR.

6.7.2 Each test certificate is to contain the following particulars:

- Purchaser's name and order number.
- Details of the rope construction.
- Core material.
- Grade of zinc coating.
- Mechanical test results.
- Adhesion test results.
- Dimensions.
- Method of breaking load testing.
- Breaking load.

7.1.2 Each length of rope is to be manufactured from suitable material of good and consistent quality. Rope materials should, in general, comply with a recognised National Standard.

7.1.3 Synthetic fibre ropes are to be suitable for the purpose intended and should comply with a recognised standard.

7.1.4 Weighting and loading matter is not to be added, and any lubricant is to be kept to a minimum. Any rot-proofing or water repellancy treatment is not to be deleterious to the fibre nor is it to add to the weight or reduce the strength of the rope.

7.2 Tests of completed ropes

7.2.1 The breaking load is to be determined by testing to destruction a sample cut from the completed rope.

7.2.2 The minimum test length and the initial test load are to be as given in Table 10.7.1. After application of the initial load, the diameter and evenness of lay up of the sample are to be checked. The sample is then to be uniformly strained at the rate given in Table 10.7.1 until it breaks.

Table 10.7.1 Breaking load test

Material	Test length mm minimum	Initial load % (see Note)	Rate of straining mm/min
Natural fibre	1800	2	150 ± 50
Synthetic fibre	900	1	100 max.
NOTE Percentage of specified minimum breaking load.			

7.2.3 The actual breaking load is to be not less than that given in an appropriate National Standard.

7.2.4 If the sample is held by grips and the break occurs within 150 mm of the grips, the test may be repeated, but not more than two tests may be made on any one coil.

7.2.5 Where difficulty is experienced in testing a sample of a completed synthetic fibre rope, LR will consider alternative methods of testing.

7.3 Identification

7.3.1 Each coil of rope is to be identified with an attached label detailing the material, construction, diameter and length.

Section 7 Fibre ropes

7.1 Manufacture

7.1.1 Fibre ropes intended as mooring lines may be made of coir, hemp, manila or sisal, or may be composed of synthetic (man-made) fibres. They may be three-strand (hawser laid), four-strand (shroud laid) or nine-strand (cable laid), but other constructions will be specially considered.

Equipment for Mooring and Anchoring

Chapter 10

Section 7

7.4 Certification

7.4.1 Printed certificates issued by the manufacturer or a competent governmental, municipal or similar responsible body will be accepted. These certificates are to give the breaking load, test length and rate of straining.

Approval of Welding Consumables

Chapter 11

Section 1

Section

- 1 **General**
- 2 **Mechanical testing procedures**
- 3 **Electrodes for manual and gravity welding**
- 4 **Wire-flux combinations for submerged-arc automatic welding**
- 5 **Wires and wire-gas combinations for manual, semi-automatic and automatic welding**
- 6 **Consumables for use in electro-slag and electro-gas welding**
- 7 **Consumables for use in one-side welding with temporary backing materials**
- 8 **Consumables for welding austenitic and duplex stainless steels**
- 9 **Consumables for welding aluminium alloys**

■ Section 1 General

1.1 Scope

1.1.1 Provision is made in this Chapter for the approval by Lloyd's Register (hereinafter referred to as 'LR') of electrodes, wires, fluxes and other consumables intended for use in the welding of the following types of materials:

- (a) Steel of various grades as represented by Grade A through to Grade FH69, see Sections 3 to 7.
- (b) A wide range of low-temperature service steels, see Sections 3 to 7.
- (c) Stainless steels including nitrogen strengthened grades and some of the duplex varieties, see Section 8.
- (d) Aluminium alloys, see Section 9.

1.1.2 For this purpose, welding, consumables are categorised and subject to the special requirements of different Sections of this Chapter.

- (a) Covered electrodes for manual welding and gravity welding.
- (b) Combinations of wire and flux for automatic submerged-arc welding.
- (c) Combinations of wire and gas for gas metal-arc welding and wires for self-shielding welding.
- (d) Combinations for electro-slag and electro-gas welding.
- (e) Combinations with temporary backing materials for one-side welding.
- (f) Consumables for welding austenitic and duplex stainless steels.
- (g) Combinations for welding aluminium.

1.2 Grading

1.2.1 Consumables for welding structural steels are graded into ten strength levels, and each of these is further subdivided into several levels in respect of notch toughness. The five basic levels of toughness are indicated by a number (1 to 5). Normal tensile strength is indicated by 'N'. Higher tensile strength is indicated by 'Y', and if the yield strength is higher than 375 N/mm² the Y is followed by a number (40 to 69), as shown in Table 11.1.1.

1.2.2 In addition to the grade, consumables are also allocated a suffix indicating the welding technique used. These are defined in the context of the following Sections of this Chapter.

1.2.3 Consumables for structural and low temperature service steels may be controlled low hydrogen and approved as such. Grade marking H15, H10 or H5 will be applied, as appropriate.

1.2.4 For joining higher strength steels, approval granted for 1Y consumables will be limited to maximum material thickness of 25 mm.

1.2.5 Test assemblies are not to be subjected to any heat treatment, except in those higher strength grades where it is considered necessary to use the welded joint in the stress relieved (tempered) condition. In those cases, the code 'sr' will be added to the approval grade.

1.2.6 Further details of grading are given in subsequent Sections of this Chapter.

1.3 Manufacture

1.3.1 The manufacturer's plant and method of production of welding consumables are to be such as to ensure reasonable uniformity in manufacture.

1.4 Approval procedures

1.4.1 Welding consumables will be approved subject to a satisfactory inspection of the works by the Surveyor for compliance with the test requirements detailed in subsequent Sections in this Chapter.

1.4.2 The test assemblies are to be prepared under the supervision of the Surveyor, and using samples selected by him. All tests are to be carried out in his presence.

1.4.3 For Charpy V-notch tests, a set of three test specimens is to be prepared and the average energy value is to comply with the requirements of subsequent Sections in this Chapter. One individual value may be less than the required average value provided that it is not less than 70 per cent of this value.

1.4.4 Where chemical analysis is required for approval, the results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

Approval of Welding Consumables

Chapter 11

Sections 1 & 2

Table 11.1.1 Welding consumable grades appropriate to structural and low temperature service steel grades

Consumable grade	Suitable for steel grades (see Notes)

3. Ferritic Low Temperature Service Steels (Ch 3,6)					
1½ Ni 3½ Ni 5 Ni 9 Ni	1½ Ni 3½ Ni 5 Ni 9 Ni	— — — —	— — — —	— — — —	
NOTES					
1. Steel grades shown in bold italic type include the equivalent (LT-xxxx) low temperature service grades referenced in Ch 3,6.					
2. The Table applies to the multi-run welding techniques (i.e. m, S, M).					

1.4.5 LR may require, in any particular case, such additional tests or requirements as may be necessary.

1.4.6 A List of Approved Welding Consumables is published by LR.

1.4.7 LR is to be notified of any alteration proposed to be made in the process of manufacture subsequent to approval. Sufficient detail is to be provided to determine the need for further testing to maintain the approval.

1.4.8 Consideration will be given to alternative procedures for approval in the case of manufacturers producing consumables under the control of another manufacturer or plant already having approval of one or more products.

1.5 Annual inspection and tests

1.5.1 All establishments where approved welding consumables are manufactured, and the associated quality control procedures, are to be subjected to annual inspection. On these occasions, samples of the approved consumables are to be selected by the Surveyor and subjected to the tests detailed in subsequent Sections in this Chapter. These are to be completed and reported before the end of the one year period beginning at the initial approval date, and repeated annually so as to provide at least an average of one annual test per year.

1.6 Changes in grading

1.6.1 Changes in grading of welding consumables will be considered only at the manufacturer's request, preferably at the time of annual testing. For upgrading and uprating, tests from butt weld assemblies will be required in addition to the normal annual approval tests. Downgrading and downrating may be imposed by LR where tests and re-tests fail to meet the requirements of this Chapter.

1.7 Manufacturers' Quality Assurance Systems

1.7.1 As an alternative to 1.5, manufacturers may seek maintenance of approval based on acceptance by LR of their 'in house' quality assurance system, and by regular audit of that system carried out in accordance with procedures approved by LR.

Section 2 Mechanical testing procedures

2.1 Dimensions of test specimens

2.1.1 Dimensions of test pieces for deposited metal tensile tests, butt weld tensile tests, bend tests and Charpy V-notch impact test are to machined to the dimensions and tolerances detailed in Chapter 2.

2.2 Testing procedures

2.2.1 The procedures used for all tensile and impact tests are to comply with the requirements of Chapter 2.

Approval of Welding Consumables

Chapter 11

Sections 2 & 3

2.2.2 Butt weld bend test specimens are to be tested at ambient temperature and are to be bent through an angle of 120° over a former having a diameter which relates to the thickness of the test specimen as detailed in subsequent Sections. For each pair of bend test specimens, one specimen is to be tested with the face of the weld in tension and the other with the root of the weld in tension.

2.2.3 Macro examinations are to be carried out on polished and etched specimens at a maximum magnification not exceeding x10. The examination is to ensure complete fusion, inter-run penetration and freedom of defects.

2.3 Re-testing procedures

2.3.1 Re-testing procedures are to comply with Ch 2, 1.4.

Section 3

Electrodes for manual and gravity welding

3.1 General

3.1.1 Dependent on the results of the mechanical and other tests, approval will be allocated as one of the grades from Table 11.3.1.

3.1.2 Approval of an electrode will be given in conjunction with a welding technique indicated by a suffix 'm' for manual welding, 'G' for gravity or contact electrode and 'p' for deep penetration electrode.

3.1.3 If the electrodes are in compliance with the requirements of the hydrogen test given in 3.4, a suffix 'H15' or 'H10' or 'H5' will be added to the grade mark. Table 11.3.1 shows the mandatory levels of low hydrogen approval for the various approval grades.

3.1.4 For each strength level, electrodes which have satisfied the requirements for a higher toughness grade are considered as complying with the requirements for a lower grade.

3.1.5 Electrodes approved for normal and higher strength levels up to and including 'Y' are also considered suitable for welding steels in the three strength levels below that for which they have been approved.

3.1.6 Electrodes approved for strength levels between Y40 and up to and including Y50 are also considered suitable for welding steels in two strength levels below that for which they have been approved.

3.1.7 Electrodes approved for strength levels Y55 and above are also considered suitable for welding steels in only one strength level below that for which they have been approved.

3.1.8 The welding current used is to be within the range recommended by the manufacturer and, where an electrode is stated to be suitable for both a.c. and d.c., a.c. is to be used for the preparation of the test assemblies.

Table 11.3.1 Minimum low hydrogen approval requirements for manual and gravity electrodes

Approval grades	Low hydrogen grade required
1 (1N), 2 (2N), 3 (3N)	NR
2Y, 3Y, 4Y	H15 (see Note 2)
2Y40 to 4Y40	H15
3Y42 to 5Y42	H10
3Y46 to 5Y46	H10
3Y50 to 5Y50	H10
3Y55 to 5Y55	H5
3Y62 to 5Y62	H5
3Y69 to 5Y69	H5
1 ¹ / ₂ Ni	H15
3 ¹ / ₂ Ni	H15
5 Ni	NR (see Note 3)
9 Ni	NR (see Note 3)
NOTES 1. NR – Not required, but approval can be sought, if desired. 2. Optional in this case. If low hydrogen approval is not obtained, there is a limitation on the carbon equivalent of the steel which is permitted to be welded. 3. Assumes use of an austenitic, non-transformable, filler material.	

3.1.9 Where an electrode is submitted only for approval for fillet welding and to which the butt weld test provided in 3.3 is not considered applicable, approval tests are to consist of the fillet weld tests as given in 3.5 and deposited metal tests with chemical analyses as given in 3.2.

3.1.10 Where an electrode is submitted for approval of both butt and fillet welding, approval tests are to include the deposited metal tests as given in 3.2, the butt weld tests as given in 3.3, and only one fillet weld test as given in 3.5 welded in the horizontal-vertical position.

3.2 Deposited metal test assemblies

3.2.1 The deposited metal test assemblies are to be prepared in the downhand position as shown in Fig. 11.3.1, one with 4 mm diameter electrodes and the other with 8 mm diameter electrodes, or the largest size manufactured if this is less than 8 mm diameter. If an electrode is available in one diameter only, one test assembly is sufficient. Any of the grades of steel in Table 11.1.1 may be used for the preparation of these assemblies, up to a strength level which is not more than two levels above that for which approval is sought.

3.2.2 The weld metal is to be deposited in single- or multi-run layers according to normal practice, and the direction of deposition of each layer is to alternate from each end of the plate, each run of weld metal being not less than 2 mm and not more than 4 mm thick. Between each run, the assembly is to be left in still air until it has cooled to less than 250°C, the temperature being taken in the centre of the weld, on the surface of the seam. After being welded, the test assemblies are not to be subjected to any heat treatment, except in those higher strength grades where it is considered necessary to use the welded joint in the stress-relieved (tempered) condition. In those cases, the code 'sr' will be added to the approval grading.

Approval of Welding Consumables

Chapter 11

Section 3

3.2.3 The chemical analysis of the deposited weld metal in each deposited metal test assembly is to be supplied by the manufacturer and is to include the content of all significant alloying elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

3.2.4 One tensile and three impact test specimens are to be taken from each test assembly as shown in Fig. 11.3.1. Care is to be taken that the axis of the tensile test specimen coincides with the centre of the weld and the mid-thickness of the plates. The impact test specimens are to be cut perpendicular to the weld, with their axes 10 mm from the upper surface. The notch is to be positioned in the centre of the weld and cut in the face of the test specimen perpendicular to the surface of the plate.

3.2.5 The results of all tests are to comply with the requirements of Table 11.3.2 as appropriate.

3.3 Butt weld test assemblies

3.3.1 Butt weld assemblies, as shown in Fig. 11.3.2, are to be prepared for each welding position (downhand, horizontal-vertical, vertical-upward, vertical-downward, and overhead) for which the electrode is recommended by the manufacturer. In the case of electrodes for normal strength and higher strength steels (up to 355 N/mm² minimum specified yield strength), electrodes satisfying the requirements for downhand and vertical-upward positions will be considered as also complying with the requirements for the horizontal-vertical position. In all other cases, approval for the horizontal-vertical position will require a butt weld to be made in that position and fully tested.

3.3.2 Where the electrode is to be approved only in the downhand position, an additional test assembly is to be prepared in that position.

Table 11.3.2 Requirements for deposited metal tests (covered electrodes)

Grade (see Note 3)	Yield stress N/mm ² minimum	Tensile strength N/mm ² (see Note 1)	Elongation on 50 mm % minimum	Charpy V-notch impact tests	
				Test temperature °C	Average energy (see Note 2) J minimum
1N, 2N, 3N	305	400 – 560	22	+20, 0, –20	47
1Y, 2Y, 3Y, 4Y	375	490 – 660	22	+20, 0, –20, –40	47
2Y40	400	510 – 690	22	0	47
3Y40	400	510 – 690	22	–20	47
3Y42	420	530 – 680	20	–20	47
3Y46	460	570 – 720	20	–20	47
3Y50	500	610 – 770	18	–20	50
3Y55	550	670 – 830	18	–20	55
3Y62	620	720 – 890	18	–20	62
3Y69	690	770 – 940	17	–20	69
4Y40	400	510 – 690	22	–40	47
4Y42	420	530 – 680	20	–40	47
4Y46	460	570 – 720	20	–40	47
4Y50	500	610 – 770	18	–40	50
4Y55	550	670 – 830	18	–40	55
4Y62	620	720 – 890	18	–40	62
4Y69	690	770 – 940	17	–40	69
5Y42	420	530 – 680	20	–60	47
5Y46	460	570 – 720	20	–60	47
5Y50	500	610 – 770	18	–60	50
5Y55	550	670 – 830	18	–60	55
5Y62	620	720 – 890	18	–60	62
5Y69	690	770 – 940	17	–60	69
1½ Ni	375	460	22	–80	34
3½ Ni	375	420	25	–100	34
5 Ni	375	500	25	–120	34
9 Ni	375	600	25	–196	34

NOTES

- Single values are the minimum requirements.
- Energy values from individual impact test specimens are to comply with 1.4.3.
- Grade 1Y is not applicable to SMAW consumables referenced in Section 3.

Approval of Welding Consumables

Chapter 11

Section 3

Fig. 11.3.1 Deposited metal test assembly

3.3.3 The grades of steel used for the preparation of the test assemblies are to be as follows:

Grade 1 (1N) electrodes	A
Grade 2 (2N) electrodes	A, B or D
Grade 3 (3N) electrodes	A, B, D or E
Grade 2Y electrodes	AH32, AH36, DH32 or DH36
Grade 3Y electrodes	AH32, AH36, DH32, DH36, EH32 or EH36
Grade 4Y electrodes	AH32, AH36, DH32, DH36, EH32, EH36, FH32 or FH36
Grade 2Y40 electrodes	AH40 or DH40
Grade 3Y40 electrodes	AH40, DH40 or EH40
Grade 4Y40 electrodes	AH40, DH40, EH40 or FH40

Where Grade 32 higher tensile steel is used, the tensile strength is to be not less than 490 N/mm². The chemical composition, including the content of grain refining elements, is to be reported in all cases where higher tensile steel is used.

3.3.4 For all other grades, the steel plates used are to be selected by reference to Table 11.1.1, and are to have at least their chemical composition and tensile properties within the limits specified for that grade in Chapter 3. The strength grade used is to be the same as that for which approval is sought, and the toughness grade is to be no higher than that for which approval is also sought.

3.3.5 The test assemblies are to be made by welding together two plates of equal thickness (15 to 20 mm), not less than 100 mm in width and of sufficient length to allow the cutting out of test specimens of the prescribed number and size. The plate edges are to be prepared to form a single V-joint, the included angle between the fusion faces being 60° and the root gap 2 to 3 mm. The root face is to be 0 to 2 mm.

3.3.6 The following welding procedure is to be adopted in making the test assemblies:

Downhand (a). The first run with 4 mm diameter electrode. Remaining runs (except the last two layers) with 5 mm diameter electrodes or above according to the normal welding practice with the electrodes. The runs of the last two layers with the largest diameter of electrode manufactured or 8 mm whichever is the lesser.

Downhand (b) (where a second downhand test is required). First run with 4 mm diameter electrode. Next run with an electrode of intermediate diameter of 5 mm or 6 mm, and the remaining runs with the largest diameter of electrode manufactured or 8 mm whichever is the lesser.

Horizontal-vertical. First run with 4 mm or 5 mm diameter electrode. Subsequent runs with 5 mm diameter electrodes.

Vertical-upward and overhead. First run with 3,25 mm diameter electrode. Remaining runs with 4 mm diameter electrodes or possibly with 5 mm if this is recommended by the manufacturer for the positions concerned.

Vertical-downward. If the electrode being tested is intended for vertical welding in the downward direction, this technique is to be adopted for the preparation of the test assembly using electrode diameters as recommended by the manufacturer.

3.3.7 For all assemblies, the back sealing runs are to be made with 4 mm diameter electrodes in the welding position appropriate to each test sample, after cutting out the root run to clean metal. For electrodes suitable for downhand welding only, the test assemblies may be turned over to carry out the back sealing run.

3.3.8 Normal welding practice is to be used and, between each run, the assembly is to be left in still air until it has cooled to less than 250°C, the temperature being taken in the centre of the weld, on the surface of the seam. After being welded, the test assemblies are not to be subjected to any heat treatment, except in those higher strength grades where it is considered necessary to use the welded joint in the stress-relieved (tempered) condition. In those cases, the code 'sr' will be added to the approval grading.

3.3.9 It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain if there are any defects in the weld prior to the preparation of test specimens.

3.3.10 The test specimens as shown in Figs. 11.3.2 and 11.3.3 are to be prepared from each test assembly.

3.3.11 The results of all tensile and impact tests are to comply with the requirements of Table 11.3.3 as appropriate. The position of fracture in the transverse tensile test is to be reported.

Approval of Welding Consumables

Chapter 11

Section 3

Fig. 11.3.2 Butt weld test assembly

3.3.12 The bend test specimens can be considered as complying with the requirements if, after bending, no crack or other open defect exceeding 3 mm in dimensions can be seen on the outer surface.

3.4 Hydrogen test

3.4.1 The hydrogen gradings are specified in 3.1.3. The hydrogen grading required determines the method of testing permitted as shown in Table 11.3.4.

3.5 Fillet weld test assemblies

3.5.1 Fillet weld assemblies as shown in Fig. 11.3.4 are to be prepared for each welding position (horizontal-vertical, vertical-upward, vertical-downward or overhead) for which the electrode is recommended by the manufacturer. The grade of steel used for the test assemblies is to be as detailed in 3.3.3. The length of the test assembly, L , is to be sufficient to allow at least the deposition of the entire length of the largest diameter electrode being tested.

Fig. 11.3.3 Butt weld test assembly position of impact test specimens

Fig. 11.3.4 Fillet weld test assembly

3.5.2 The electrode sizes to be used are the maximum and minimum diameters recommended by the manufacturer for fillet welding. The first side is to be welded using the maximum diameter. The second side is to be welded only after the assembly has been allowed to cool below 50°C using the minimum diameter. The size of these single run fillet welds will, in general, be determined by the electrode size and the welding current employed during testing and should represent the range of fillet weld bead sizes recommended by the manufacturer.

3.5.3 Each test assembly is to be sectioned to form three macro-sections, each about 25 mm thick. These are to be examined for root penetration, satisfactory profile, freedom from cracking and reasonable freedom from porosity and slag inclusions. Any undercut is not to exceed 0.5 mm in depth. Convexity or concavity of the profile is not to exceed one-tenth of the fillet bead throat dimension. All such observations are to be reported.

3.5.4 Hardness measurements are to be made on the central macro-section only, as shown in Fig. 11.3.5. The results are to be reported.

Approval of Welding Consumables

Section 3

Table 11.3.3 Requirements for butt weld tests (covered electrodes)

Grade (see Note 3)	Tensile strength N/mm ²	Bend test ratio: $\frac{D}{t}$	Charpy V-notch impact tests	
			Test temperature °C	Average energy (see Note 1) J minimum
				All positions (see Note 2)
1N, 2N, 3N	400	3	+20, 0, -20	47 (34)
1Y, 2Y, 3Y, 4Y	490	3	+20, 0, -20, -40	47 (34)
2Y40	510	3	0	47 (39)
3Y40	510	3	-20	47 (39)
3Y42	530 – 680	4	-20	47
3Y46	570 – 720	4	-20	47
3Y50	610 – 770	4	-20	50
3Y55	670 – 830	5	-20	55
3Y62	720 – 890	5	-20	62
3Y69	770 – 940	5	-20	69
4Y40	510	3	-40	47 (39)
4Y42	530 – 680	4	-40	47
4Y46	570 – 720	4	-40	47
4Y50	610 – 770	4	-40	50
4Y55	670 – 830	5	-40	55
4Y62	720 – 890	5	-40	62
4Y69	770 – 940	5	-40	69
5Y42	530 – 680	4	-60	47
5Y46	570 – 720	4	-60	47
5Y50	610 – 770	4	-60	50
5Y55	670 – 830	5	-60	55
5Y62	720 – 890	5	-60	62
5Y69	770 – 940	5	-60	69
1 ¹ / ₂ Ni	490	3	-80	27
3 ¹ / ₂ Ni	450	3	-100	27
5 Ni	540	4	-120	27
9 Ni	640	4	-196	27

NOTES

- Energy values from individual impact test specimens are to comply with 1.4.3.
- Values in () apply only to welds made in the vertical position with upward progression.
- Grade 1Y is not applicable to SMAW consumables referenced in Section 3.

3.5.5 One of the remaining sections of the assembly is to have the weld on the first side gouged or machined to facilitate breaking the fillet weld on the second side by closing the two plates together, subjecting the root of the weld to tension. On the other remaining section, the weld on the second side is to be gouged or machined and the section fractured using the same procedure. The fractured surfaces are to be examined. They are to show satisfactory penetration, freedom from cracks and reasonable freedom from porosity and this should be reported.

3.6 Electrodes designed for deep penetration welding

3.6.1 Where an electrode is designed solely for the deep penetration welding of downhand butt joints and horizontal-vertical fillets in normal tensile strength steel, only the tests detailed in 3.7 and 3.8 are required for approval purposes.

Table 11.3.4 Permitted methods for obtaining low hydrogen grading

Hydrogen Grade	Permitted Method
H15	ISO 3690 (or Glycerine) (See Note)
H10	ISO 3690
H5	ISO 3690
NOTE ISO method preferred.	

3.6.2 Electrodes designed solely for the deep penetration welding technique will be approved as complying with Grade 1 requirements only and will be given the suffix 'p'.

3.6.3 Where a manufacturer recommends that an electrode having deep penetrating properties can also be used for downhand butt welding of thicker plates with prepared edges, the electrode will be treated as a normal penetration electrode, and the full series of tests in the downhand position is to be carried out, together with the deep penetration tests given in 3.7 and 3.8.

3.6.4 Where a manufacturer desires to demonstrate that an electrode, in addition to its use as a normal penetration electrode, also has deep penetrating properties when used for downhand butt welding and horizontal fillet welding, the additional tests given in 3.7 and 3.8 are to be carried out.

3.6.5 Electrodes approved for both normal and deep penetration welding will have the suffix 'p' added after the appropriate grade mark for normal penetration welding.

3.6.6 Where the manufacturer prescribes a different welding current and procedure for the electrode when used as a deep penetration electrode and a normal penetration electrode, the recommended current and procedure are to be used when making the test assemblies in each case.

3.7 Deep penetration butt weld test assemblies

3.7.1 Two plates of thickness equal to twice the diameter of the core of the electrode plus 2 mm are to be butt welded together with one downhand run of welding from each side. The plates are to be not less than 100 mm wide and of sufficient length to allow the cutting out of the test specimens of the correct number and size as shown in Fig. 11.3.6. Grade A steel is to be used for these test assemblies. The joint edges are to be prepared square and smooth and, after tacking, the gap is not to exceed 0,25 mm. The test assembly is to be welded using an 8 mm diameter electrode, or the largest diameter manufactured if this is less than 8 mm and the assembly is to be allowed to cool below 50°C between runs.

3.7.2 The test specimens as shown in Figs. 11.3.3 and 11.3.6 are to be prepared from each test assembly.

3.7.3 The results of tensile and impact tests are to comply with the requirements of Table 11.3.3 for Grade 1 electrodes. The position of fracture in the tensile test is to be reported. The bend test specimens are to be in accordance with 3.3.12.

3.7.4 The discards at the end of the welded assemblies are to be not more than 35 mm wide. The joints of these discards are to be polished and etched and must show complete fusion and inter-penetration of the weld beads. At each cut in the test assembly, the joints are also to be examined to ensure that complete fusion has taken place.

Approval of Welding Consumables

Chapter 11

Section 3

3.8 Deep penetration fillet weld test assemblies

3.8.1 A fillet weld assembly is to be prepared as shown in Fig. 11.3.7 with plates about 12,5 mm in thickness. The welding is to be carried out with one run for each fillet with plate A in the horizontal plane during the welding operations. The length of the fillet is to be 160 mm and the gap between the plates is to be not more than 0,25 mm. Grade A steel is to be used for these test assemblies.

3.8.2 The fillet weld on one side of the assembly is to be carried out with a 4 mm diameter electrode, and that on the other side with the maximum diameter of electrode manufactured. The welding current used is to be within the range recommended by the manufacturer, and the welding is to be carried out using normal welding practice except that the assembly is to be allowed to cool below 50°C between runs.

3.8.3 The welded assembly is to be cut by sawing or machining within 35 mm of the ends of the fillet welds, and the joints are to be polished and etched. The welding of the fillet made with a 4 mm diameter electrode is to show a penetration of 4 mm (see Fig. 11.3.7) and the corresponding penetration of the fillet made with the maximum diameter of electrode manufactured is to be reported.

3.9 Electrodes designed for gravity or contact welding

3.9.1 Approval for welding using the gravity, 'G', technique is available for welding only normal strength and higher tensile steels up to and including Grade 36.

3.9.2 Where an electrode is submitted solely for approval for use in contact welding using automatic gravity or similar welding devices, deposited metal tests, butt weld tests and, where appropriate, fillet weld tests similar to those for normal manual electrodes are to be carried out using the process for which the electrode is recommended by the manufacturer.

3.9.3 Where an electrode is submitted for approval for use in contact welding using automatic gravity or similar welding devices in addition to normal manual welding, butt weld and, where appropriate, fillet weld tests, using the gravity or other contact device as recommended by the manufacturer, are to be carried out in addition to the normal approval tests.

3.10 Certification

3.10.1 Each carton or package of approved electrodes is to contain a certificate from the manufacturer generally in accordance with the following:

'The.....company certifies that the composition and quality of these electrodes conform with those of the electrodes used in making the test pieces submitted to and approved by the approval bodies nominated on the label of this package.'

3.10.2 Additionally, the manufacturer will be required to sign a similar declaration relating to continuing production.

3.11 Annual tests

3.11.1 For normal penetration electrodes, the annual tests are to consist of two deposited metal test assemblies. These are to be prepared and tested in accordance with 3.2. If an electrode is available in one diameter only, one test assembly is sufficient.

3.11.2 Where an electrode is approved solely for deep penetration welding, the annual test is to consist of one butt welded test assembly. This is to be prepared and tested in accordance with 3.7.

3.11.3 Where an electrode is approved for both normal and deep penetration welding, annual tests as detailed in 3.11.1 and 3.11.2 are to be carried out.

3.11.4 Where an electrode is approved solely for gravity or contact welding, the annual test is to consist of one deposited metal test assembly using the gravity or other contact device as recommended by the manufacturer.

3.11.5 Where an electrode is approved for both manual and gravity welding, annual tests as detailed in 3.11.1 and 3.11.4 are to be carried out.

Approval of Welding Consumables

Chapter 11

Sections 3 & 4

Section 4

Wire-flux combinations for submerged-arc automatic welding

4.1 General

4.1.1 Wire-flux combinations for single and multiple electrode submerged-arc automatic welding, without the use of temporary backing, are divided into the following two categories:

- For use with the multi-run technique.
- For use with the two-run technique.

Where particular wire-flux combinations are intended for welding with both techniques, tests are to be carried out for each technique.

4.1.2 Dependent on the results of mechanical and other tests, approval will be allocated as one of the grades from Table 11.1.1.

4.1.3 The suffixes T or M will be added after the grade mark to indicate approval for the two-run technique or, multi-run technique respectively.

4.1.4 Wire-flux combinations satisfying the requirements for multi-run or two-run techniques will also be approved for fillet welding in the downhand and horizontal-vertical position, subject to agreement by the manufacturer.

4.1.5 If the consumable combination is in compliance with the requirements of the hydrogen test given in 3.4, a suffix H15, H10 or H5 will be added to the grade. Table 11.4.1 shows the mandatory levels of low hydrogen approval for the various approval grades.

Table 11.4.1 Minimum low hydrogen approval requirements for wire-flux combinations

Approval grade	'H' grade for Multi-run	'H' grade for Two-run
1 (1N), 2 (2N), 3 (3N)	NR	NR
1Y, 2Y, 3Y, 4Y	NR	NR
2Y40 to 4Y40	H15	NR
3Y42 to 5Y42	H10	H15
3Y46 to 5Y46	H10	H15
3Y50 to 5Y50	H10	H10
3Y55 to 5Y55	H5	H10
3Y62 to 5Y62	H5	H5
3Y69 to 5Y69	H5	H5
1 ¹ / ₂ Ni	H15	NR
3 ¹ / ₂ Ni	H15	NR
5 Ni (see Note 2)	NR	NR
9 Ni (see Note 2)	NR	NR

NOTES

1. NR – Not required, but approval can be sought, if desired.
2. Assumes use of an austenitic, non-transformable, filler material.

4.1.6 For each strength level, wire-flux combinations which have satisfied the requirements for a higher toughness grade are considered as complying with the requirements for a lower grade.

4.1.7 Wire-flux combinations approved with multi-run technique for normal and higher strength levels up to and including 'Y' are also considered suitable for welding steels in the three strength levels below that for which they have been approved.

4.1.8 Wire-flux combinations approved with multi-run technique for strength levels between Y40 and up to and including Y50 are also considered suitable for welding steels in two strength levels below that for which they have been approved.

4.1.9 Wire-flux combinations approved with multi-run technique for strength levels Y55 and above are also considered suitable for welding steels in only one strength level below that for which they have been approved.

4.1.10 Wire-flux combinations with two-run technique approval are not considered suitable for welding steels of any other strength level with that technique, see 4.5.1.

4.1.11 The welding current may be either a.c. or d.c. (electrode positive or negative) according to the recommendation of the manufacturer. If both a.c. and d.c. are recommended, a.c. is to be used for the tests.

4.1.12 Wire-flux combinations for multiple electrode submerged-arc welding will be subject to separate approval tests. These are to be carried out generally in accordance with the requirements of this Section.

4.1.13 Wire-flux combinations are not naturally low hydrogen in character, but for the lower strength grades of steel low hydrogen testing is not normally a requirement for approval. With higher strength steels it is more important and Table 11.4.1 shows the mandatory minimum low hydrogen status required for approval of wire-flux combinations.

4.2 Approval tests for multi-run technique

4.2.1 Where approval for use with the multi-run technique is requested, deposited metal and butt weld tests are to be carried out.

4.3 Deposited metal test assemblies (multi-run technique)

4.3.1 One deposited metal test assembly is to be prepared as shown in Fig. 11.4.1, using any of the grades of steel in Table 11.1.1 up to a strength level which is not more than two levels above that for which approval is sought.

4.3.2 The bevelling of the plate edges is to be carried out by machining or mechanised gas cutting. In the latter case any remaining scale is to be removed from the bevelled edges.

Fig. 11.4.1 Deposited metal test assembly

4.3.3 Welding is to be in the downhand position, and the direction of deposition of each run is to alternate from each end of the plate. After completion of each run, the flux and welding slag are to be removed. Between each run, the assembly is to be left in still air until it has cooled to less than 250°C, the temperature being taken in the centre of the weld, on the surface of the seam. The thickness of the layer is to be not less than the diameter of the wire nor less than 4 mm, unless it is clearly stated as part of the consumable manufacturer's published recommendations.

4.3.4 The welding conditions (amperage, voltage and rate of travel) are to be in accordance with the recommendations of the manufacturer and are to conform with normal good welding practice for multi-run welding.

4.3.5 The chemical analysis of the deposited weld metal in each test assembly is to be supplied by the manufacturer and is to include the content of all significant alloying elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

4.3.6 Two longitudinal tensile and three impact test specimens are to be taken from each test assembly as shown in Fig. 11.4.1. Care is to be taken that the axes of the tensile test specimens coincide with the centre of the weld and the mid-thickness of the plates. The impact test specimens are to be cut perpendicular to the weld with their axes 10 mm from the upper surface. The notch is to be positioned in the centre of the weld and cut in the face of the test specimen perpendicular to the surface of the plate.

4.3.7 In those cases where two-run technique approval is also sought, only one longitudinal tensile specimen need be prepared and tested from this assembly.

4.3.8 The results of all tests are to comply with the requirements of Table 11.4.2, as appropriate.

4.4 Butt weld test assemblies (multi-run technique)

4.4.1 One butt weld test assembly is to be prepared as shown in Fig. 11.4.2.

4.4.2 The grade of steel used for the preparation of the test assembly are to be as follows:

Grade 1 wire-flux combination	A
Grade 2 wire-flux combinations	A, B or D
Grade 3 wire-flux combinations	A, B, D or E
Grade 1Y wire-flux combination	AH32 or AH36
Grade 2Y wire-flux combinations	AH32, AH36, DH32 or DH36
Grade 3Y wire-flux combinations	AH32, AH36, DH32, DH36, EH32 or EH36
Grade 4Y wire-flux combinations	AH32, AH36, DH32, DH36, EH32, EH36, FH32 or FH36
Grade 2Y40 wire-flux combination	AH40 or DH40
Grade 3Y40 wire-flux combinations	AH40, DH40 or EH40
Grade 4Y40 wire-flux combinations	AH40, DH40, EH40 or FH40

Where Grade 32 higher tensile steel is used, the tensile strength is to be not less than 490 N/mm². The chemical composition, including the content of grain refining elements, is to be reported in all cases where higher tensile steel is used.

4.4.3 For all other grades, the steel plates used are to be selected by reference to Table 11.1.1, and are to have at least their chemical composition and tensile properties within the limits specified for that grade in Chapter 3. The strength grade used is to be the same as that for which approval is sought, and the toughness grade is to be no higher than that for which approval is also sought.

4.4.4 The plate edges are to be prepared to form a single V-joint, the included angle between the fusion faces being 60° and the root face being 4 mm. The bevelling of the plate edges is to be carried out by machining or mechanised gas cutting. In the latter case, any remaining scale is to be removed from bevelled edges.

Approval of Welding Consumables

Table 11.4.2 Requirements for deposited metal tests (wire-flux combinations)

Grade	Yield stress N/mm ² minimum	Tensile strength N/mm ²	Elongation on 50 mm % minimum	Charpy V-notch impact tests	
				Test temperature °C	Average energy (see Note) J minimum
1N, 2N, 3N	305	400 – 560	22	+20, 0, –20	34
1Y, 2Y, 3Y, 4Y	375	490 – 660	22	+20, 0, –20, –40	34
2Y40	400	510 – 690	22	0	39
3Y40	400	510 – 690	22	–20	39
3Y42	420	530 – 680	20	–20	47
3Y46	460	570 – 720	20	–20	47
3Y50	500	610 – 770	18	–20	50
3Y55	550	670 – 830	18	–20	55
3Y62	620	720 – 890	18	–20	62
3Y69	690	770 – 940	17	–20	69
4Y40	400	510 – 690	22	–40	39
4Y42	420	530 – 680	20	–40	47
4Y46	460	570 – 720	20	–40	47
4Y50	500	610 – 770	18	–40	50
4Y55	550	670 – 830	18	–40	55
4Y62	620	720 – 890	18	–40	62
4Y69	690	770 – 940	17	–40	69
5Y42	420	530 – 680	20	–60	47
5Y46	460	570 – 720	20	–60	47
5Y50	500	610 – 770	18	–60	50
5Y55	550	670 – 830	18	–60	55
5Y62	620	720 – 890	18	–60	62
5Y69	690	770 – 940	17	–60	69
1 1/2 Ni	375	460	22	–80	34
3 1/2 Ni	375	420	25	–100	34
5 Ni	375	500	25	–120	34
9 Ni	375	600	25	–196	34

NOTE
Energy values from individual impact test specimens are to comply with 1.4.3.

4.4.5 Welding is to be carried out in the downhand position by the multi-run technique, and the welding conditions are to be the same as those adopted for the deposited metal test assembly. The back sealing run is to be applied in the downhand position after cutting out the root run to clean metal.

4.4.6 It is recommended that the welded assembly be subjected to a radiographic examination to ascertain if there are any defects in the weld prior to the preparation of test specimens.

4.4.7 The test specimens as shown in Fig. 11.3.3 and Fig. 11.4.2 are to be prepared from each test assembly.

4.4.8 The results of all tensile and impact tests are to comply with the requirements of Table 11.4.3, as appropriate. The position of fracture of the transverse tensile test is to be reported.

4.4.9 The bend test specimens can be considered as complying with the requirements if, after bending, no cracks or other open defects exceeding 3 mm in dimension can be seen on the outer surface.

4.5 Approval tests for two-run technique

4.5.1 Where approval for use with the two-run technique is requested, two butt weld test assemblies are to be prepared and tested using plates of the strength level for which approval is required. Each strength level requires separate approval.

4.5.2 Each pair of welded assemblies is to be made from plates of two thicknesses. The thickness of the thicker pair of plates will be the maximum for which the approval is valid. The second assembly is to be welded from plates having approximately half of the thickness of the first assembly.

Approval of Welding Consumables

Chapter 11

Section 4

4.6 Butt weld test assemblies (two-run technique)

4.6.1 The grade of steel used for the preparation of the test assemblies is not to be of any higher grade (impact toughness) than that for which approval is required. The chemical composition, including the content of grain refining elements, and the strength properties of the plates used, are to be reported.

4.6.2 The maximum diameter of wire and the edge preparation to be used are to be in accordance with Table 11.4.4. Small deviations in the edge preparation may be allowed if requested by the manufacturer. The bevelling of the plate edges is to be performed by machining or mechanised gas cutting. In the latter case, any remaining scale is to be removed from the bevelled edges. The root gap should not exceed 0,7 mm.

4.6.3 Each butt weld is to be welded in two runs, one from each side, using amperages, voltages and travel speeds in accordance with the recommendations of the manufacturer and normal good welding practice. After completion of the first run, the flux and welding slag are to be removed and the assembly is to be left in still air until it has cooled to less than 100°C, the temperature being taken in the centre of the weld, on the surface of the seam.

4.6.4 It is recommended that the butt weld assemblies be subjected to radiographic examination to ascertain if there are any defects in the weld prior to the preparation of test specimens.

4.6.5 The test specimens, as shown in Fig. 11.4.3 and Fig. 11.4.4, are to be prepared from each test assembly. The edges of two of the discards are to be polished and etched, and must show complete fusion and inter-run penetration of the welds. At each cut in the test assembly, the edges are also to be examined to ensure that complete fusion has taken place.

4.6.6 The results of transverse tensile and impact tests are to comply with the requirements of Table 11.4.3 as appropriate. The position of fracture of the transverse tensile tests is to be reported.

4.6.7 The bend test specimens can be considered as complying with the requirements if, after bending, no crack or other open defects exceeding 3 mm in dimensions can be seen on the outer surface. One of the specimens from each assembly is to be tested with the side first welded in tension, and the second specimen with the other side in tension.

4.6.8 The longitudinal tensile specimen shown in Fig. 11.4.3 is to be prepared from the thicker assembly, even in those cases where multi-run technique approval is also sought. This test specimen is to be machined to the dimensions shown in Ch 11.2.1.1, and the longitudinal axis is to coincide with the centre of the weld about 7 mm below the plate surface on the side from which the second run is made. The test specimen may be given a hydrogen release treatment in accordance with 2.1.1. The results of this test are to comply with the requirements of Table 11.4.2.

4.6.9 The chemical analysis of the weld metal of the second run in each assembly is to be determined and reported. This is to include the content of all significant elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

4.7 Annual tests

4.7.1 Annual tests are to consist of at least the following:

- For wire-flux combinations approved for the multi-run technique, one deposited metal test assembly.
- For wire-flux combinations approved for the two-run technique, one butt weld test assembly using plate material 20 to 25 mm in thickness.

Approval of Welding Consumables

Chapter 11

Section 4

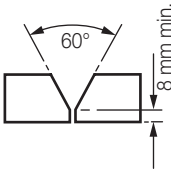

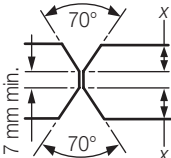

Table 11.4.3 Requirements for butt weld tests (wire-flux combinations)

Grade	Tensile strength N/mm ²	Bend test ratio: $\frac{D}{t}$	Charpy V-notch impact tests	
			Test temperature °C	Average energy (see Notes 1 and 2) J minimum
1N, 2N, 3N	400	3	+20, 0, -20	34
1Y, 2Y, 3Y, 4Y	490	3	+20, 0, -20, -40	34
2Y40	510	3	0	39
3Y40	510	3	-20	39
3Y42	530 – 680	4	-20	47 (41)
3Y46	570 – 720	4	-20	47
3Y50	610 – 770	4	-20	50
3Y55	670 – 830	5	-20	55
3Y62	720 – 890	5	-20	62
3Y69	770 – 940	5	-20	69
4Y40	510	3	-40	39
4Y42	530 – 680	4	-40	47 (41)
4Y46	570 – 720	4	-40	47
4Y50	610 – 770	4	-40	50
4Y55	670 – 830	5	-40	55
4Y62	720 – 890	5	-40	62
4Y69	770 – 940	5	-40	69
5Y42	530 – 680	4	-60	47 (41)
5Y46	570 – 720	4	-60	47
5Y50	610 – 770	4	-60	50
5Y55	670 – 830	5	-60	55
5Y62	720 – 890	5	-60	62
5Y69	770 – 940	5	-60	69
1 ¹ / ₂ Ni	490	3	-80	27
3 ¹ / ₂ Ni	450	3	-100	27
5 Ni	540	4	-120	27
9 Ni	640	4	-196	27

NOTES

1. Energy values from individual impact test specimens are to comply with 1.4.3.
2. Values in () apply only to two-run technique impact test specimens.

Table 11.4.4 Butt weld assembly preparation

Plate thickness mm	Recommended diameter	Maximum diameter of wire mm
12,5		5
20–25		6
35–40		7

4.7.2 The deposited metal assemblies are to be prepared and tested in accordance with 4.3, except that only one longitudinal tensile, three impact test specimens and a chemical analysis are required.

4.7.3 The butt weld test assemblies are to be prepared and tested in accordance with 4.6, except that only one transverse tensile, two bend, three impact test specimens and a chemical analysis are required. One longitudinal tensile specimen is also to be prepared where the wire-flux combination is approved solely for the two-run technique.

4.7.4 Where a wire-flux combination is approved for welding a range of steels with different specified minimum strength levels, steel of the highest strength approved is to be used for the preparation of the butt weld assembly required by 4.7.1(b).

Section 5

Wires and wire-gas combinations for manual, semi-automatic and automatic welding

5.1 General

5.1.1 Wire-gas combinations and flux-cored or flux-coated wires (for use with or without a shielding gas) are divided into the following categories for the purposes of approval testing:

- For use in manual multi-run welding with the inert gas tungsten arc welding process (GTAW).
- For use in semi-automatic multi-run metal arc welding.
- For use in single electrode multi-run automatic metal arc and GTAW welding.
- For use in single electrode two-run automatic metal arc and GTAW welding.

5.1.2 The term 'manual' is used to describe the technique where the gas-shielded tungsten arc torch is held in one hand and the filler is added separately by the other hand.

5.1.3 The term 'semi-automatic' is used to describe processes in which the weld is made manually by a welder holding a gun through which the wire is continuously fed.

5.1.4 In the GTAW process, 'automatic' refers to the fully mechanised control and application of both torch and separate filler wire.

Approval of Welding Consumables

Chapter 11

Sections 4 & 5

5.1.5 Dependent on the results of mechanical and other tests, approval will be allocated as one of the grades from Table 11.1.1.

5.1.6 A suffix S will be added after the grade mark to indicate approval for semi-automatic multi-run welding.

5.1.7 For wires intended for automatic welding, the suffixes T or M will be added after the grade mark to indicate approval for two-run or multi-run welding techniques, respectively.

5.1.8 For wires intended for both semi-automatic and automatic welding, the suffixes will be added in combination.

5.1.9 Solid wire-gas combinations are considered naturally low hydrogen in character and qualify for 'H15' approval without testing. This is not so for cored wires and continuous coated wires which must be tested if there is a need for low hydrogen approval. For the lower strength grades of steel, low hydrogen testing is not normally a requirement for approval. With higher strength steels, it is more important and Table 11.5.1 shows the mandatory minimum low hydrogen status required for approval of wire-gas combinations.

5.1.10 The testing methods to be used for low hydrogen approval are to be in accordance with 3.4, modified to use the manufacturer's recommended welding conditions and adjusting the deposition rate to give a weld deposit weight per sample similar to that deposited when using manual electrodes.

5.1.11 Where applicable, the approved combination will name either the specific gas composition or its trade name, but in either case the composition of the shielding gas is to be reported. Unless otherwise agreed, additional approval tests are required when a shielding gas is used other than that used for the original approval tests. However a wire and gas combination approved with an argon/carbon dioxide shielding gas where the carbon dioxide is between 15-25 per cent is also approved for other combinations of argon/carbon dioxide, provided the carbon dioxide content is within the range 15-25 per cent. The range of approval is limited to ferritic consumables in solid wire, flux cored and coated wire forms and subject to the agreement of the consumable manufacturer and LR.

5.1.12 Wires and wire-gas combinations for multiple electrode automatic welding will be subject to separate approval tests. Any proposals are to be submitted for consideration.

5.1.13 Wires and wire-gas combinations approved with multi-run technique for normal and higher strength levels up to and including 'Y' are also considered suitable for welding steels in the three strength levels below that for which they have been approved.

5.1.14 Wires and wire-gas combinations approved with multi-run technique for strength levels between Y40 and up to and including Y50 are also considered suitable for welding steels in two strength levels below that for which they have been approved.

5.1.15 Wires and wire-gas combinations approved with multi-run technique for strength levels Y55 and above are also considered suitable for welding steels in only one strength level below that for which they have been approved.

5.1.16 Wires and wire-gas combinations with two-run technique approval are not considered suitable for welding steels of any other strength level with that technique, see 5.4.1.

5.2 Approval tests for manual and semi-automatic multi-run welding

5.2.1 Approval tests for manual (GTAW) and semi-automatic multi-run welding are to be carried out generally in accordance with the requirements of Section 3, except as required by 5.2, using the respective technique for the preparation of all test assemblies.

5.2.2 Two deposited metal test assemblies are to be prepared in the downhand position as shown in Fig. 11.3.1, one using the smallest diameter, and the other using the largest diameter of wire for which approval is required. Where only one diameter is manufactured, only one deposited metal assembly is to be prepared.

5.2.3 The weld metal is to be deposited according to the practice recommended by the manufacturer, and the thickness of each layer of weld metal is to be between 2 mm and 6 mm, unless it is clearly stated as part of the consumable manufacturer's published recommendations.

5.2.4 The chemical analysis of the deposited weld metal in each test assembly is to be supplied by the manufacturer and is to include the content of all significant alloying elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

5.2.5 Butt weld assemblies as shown in Fig. 11.3.2 are to be prepared for each welding position for which the wire is to be approved. In the case of approvals for normal and higher strength steels (up to 355 N/mm² minimum specified yield strength), tests satisfying the requirements in both the downhand and vertical-upward positions will be considered as having also satisfied the requirements for the horizontal-vertical position.

5.2.6 The downhand assembly is to be welded using, for the first run, wire of the smallest diameter to be approved and, for the remaining runs, wire of the largest diameter to be approved.

5.2.7 Where approval is requested only in the downhand position, an additional butt weld assembly is to be prepared in that position using, if possible, wires of different diameter from those required by 5.2.6. If only one wire diameter is to be approved, this second downhand butt weld should be made using either larger or smaller beads than the first assembly.

Approval of Welding Consumables

Chapter 11

Section 5

Table 11.5.1 Minimum low hydrogen approval requirements for wires and wire-gas combinations

Approval grade	'H' grade for m and S techniques	'H' grade for M technique	'H' grade for T technique
1 (1N), 2 (2N), 3 (3N)	NR	NR	NR
1Y, 2Y, 3Y, 4Y	H15 (see Note 2)	NR	NR
2Y40 to 4Y40	H15	NR	H15
3Y42 to 5Y42	H10	H10	H15
3Y46 to 5Y46	H10	H10	H15
3Y50 to 5Y50	H10	H10	H10
3Y55 to 5Y55	H5	H5	H10
3Y62 to 5Y62	H5	H5	H5
3Y69 to 5Y69	H5	H5	H5
1 ¹ / ₂ Ni	H15	H15	NR
3 ¹ / ₂ Ni	H15	H15	NR
5 Ni	NR (see Note 3)	NR	NR
9 Ni	NR (see Note 3)	NR	NR

NOTES

1. NR – Not required, but approval can be sought, if desired.
2. Optional in this case. If low hydrogen approval is not obtained, there is a limitation on the carbon equivalent of the steel which is permitted to be welded.
3. Assumes use of an austenitic, non-transformable, filler material.

5.2.8 The butt weld assemblies, in positions other than downhand, are to be welded using, for the first run, wire of the smallest diameter to be approved, and for the remaining runs, the largest diameter of wire recommended by the manufacturer for the position concerned.

5.2.9 Fillet weld test assemblies as detailed in 3.5 are to be prepared, examined and tested.

5.2.10 Low hydrogen approval tests are to be carried out if required by 5.1.9.

5.2.11 Test specimens from each assembly are to be prepared and tested in accordance with the requirements of 3.2 and 3.3.

5.3 Approval tests for multi-run automatic welding

5.3.1 Approval tests for multi-run automatic welding are to be carried out generally in accordance with the requirements of Section 4, except as required by 5.3, using the multi-run automatic welding technique for the preparation of all test assemblies.

5.3.2 One deposited metal test assembly is to be prepared as shown in Fig. 11.4.1. Welding is to be as detailed in 4.3.3, except that the thickness of each layer is to be not less than 3 mm, unless it is clearly stated as part of the consumable manufacturer's published recommendations.

5.3.3 One butt weld test assembly is to be prepared as shown in Fig. 11.4.2 for each welding position to be approved for the automatic multi-run technique.

5.3.4 Test specimens from each test assembly are to be prepared and tested in accordance with the requirements of Section 4 for multi-run submerged-arc automatic welding.

5.3.5 Low hydrogen approval tests are to be made if required by 5.1.9.

5.3.6 At the discretion of LR, wires approved for semi-automatic welding may also be approved without additional tests, for use in multi-run automatic welding.

5.4 Approval tests for two-run automatic welding

5.4.1 Approval tests for two-run automatic welding are to be carried out generally in accordance with the requirements of Section 4, except as required by 5.4, using the two-run automatic welding technique for the preparation of all test assemblies. Two butt weld test assemblies are to be prepared and tested using plates of the strength level for which approval is required. Each strength level requires separate approval.

5.4.2 Two butt weld test assemblies are to be prepared generally as detailed in 4.5 and 4.6 using plates 12 to 15 mm and 20 to 25 mm in thickness.

5.4.3 If approval is requested for welding plate thicker than 25 mm, one assembly is to be prepared using plates approximately 20 mm in thickness and the other using plates of the maximum thickness for which approval is requested.

5.4.4 The edge preparation of the test assemblies is to be as shown in Fig. 11.5.1. Small deviations in edge preparation may be allowed, if these form part of the consumable manufacturer's recommendations. For assemblies using plates over 25 mm in thickness, the edge preparation is to be reported for information.

5.4.5 The diameters of wires used are to be in accordance with the recommendations of the manufacturer and are to be reported.

5.4.6 Test specimens from each butt weld assembly are to be prepared and tested in accordance with the requirements of Section 4 for two-run submerged-arc automatic welding.

5.4.7 The weld metal chemical analysis is to be reported as in 4.6.9. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

5.5 Annual tests

5.5.1 Annual tests are to consist of at least the following:

- (a) Wires approved for manual welding or semi-automatic welding or either of these combined with approval for automatic multi-run welding:
 - one deposited metal test assembly prepared in accordance with 5.2 using a wire of diameter within the approved range.
- (b) Wire approved for automatic multi-run welding:
 - one deposited metal test assembly prepared in accordance with 5.3 using a wire of diameter as stated in (a).
- (c) Wires approved for two-run automatic welding:
 - one butt weld test assembly prepared in accordance with 5.4 using plates 20 to 25 mm in thickness or the maximum approved thickness. The diameter of wire used is to be reported.

Section 6

Consumables for use in electro-slag and electro-gas welding

6.1 General

6.1.1 The requirements for the approval of consumables used for electro-slag or electro-gas welding (including consumable nozzles, where applicable) are generally as detailed in Section 4 for two-run submerged-arc welding consumables, except as otherwise detailed in this Section.

6.1.2 For each grade, approval may be restricted for use with specific compositional types of steel. For Grades 1Y, 2Y, 3Y, 4Y, 2Y40, 3Y40 and 4Y40 this will normally be in respect of the grain refining element content, and tests on niobium grain refined steel will normally qualify for use also on steels treated with aluminium or vanadium or combinations of these elements.

6.1.3 Each strength level requires separate approval involving the welding and testing of two butt weld assemblies of different thickness. The greater thickness will determine the maximum approved thickness.

6.2 Butt weld test assemblies

6.2.1 Two butt weld test assemblies are to be prepared, one with plates 20 to 25 mm in thickness and the other with plates 35 to 40 mm in thickness. The steel used is not to be of any higher grade (impact toughness) than that for which approval is required. The limitations of 6.1.2 need to be considered in this Section. The chemical composition of the plate, including the content of grain refining elements, is to be reported.

6.2.2 The welding conditions and the edge preparation adopted are to be in accordance with the recommendations of the manufacturer and are to be reported in detail. The manufacturer's maximum recommended gap between plates is to be used in making the test assemblies.

6.2.3 It is recommended that the assemblies are subjected to radiographic examination to identify any defects before the preparation of any test specimens.

6.2.4 Test specimens as follows, and as shown in Fig. 11.6.1, are to be prepared from each test assembly:

- (a) Two longitudinal tensile test specimens.
- (b) Two transverse tensile test specimens.
- (c) Two bend test specimens.
- (d) One macro-section.
- (e) Two sets of three impact test specimens notched in accordance with Fig. 11.6.2.

6.2.5 The chemical analysis of the weld metal in each assembly is to be determined and reported. This is to be supplied by the manufacturer and is to include the content of all significant elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

6.2.6 The results of all transverse tensile and impact tests are to comply with the requirements given in Table 11.4.3 as appropriate. The position of fracture of the transverse tensile test is to be reported. The Charpy V-notch impact test requirements are as for the two-run technique in Table 11.4.3.

6.2.7 The results of all longitudinal tensile tests are to comply with the requirements of Table 11.4.2.

6.2.8 The bend test specimens are to be in accordance with 4.6.7 and Table 11.4.3. Each surface of the weld is to be tested in tension.

6.3 Annual tests

6.3.1 Annual tests are to consist of at least one butt weld test assembly using plate material 20 to 25 mm in thickness.

6.3.2 The assembly is to be prepared and tested in accordance with 6.2 except that only the following tests are required:

- (a) One longitudinal tensile test.
- (b) One transverse tensile test.
- (c) Two bend tests.
- (d) One set of three Charpy V-notch impact tests with the specimens notched at the centre of the weld (position (1) in Fig. 11.6.2).
- (e) Chemical analysis.

6.3.3 Where a consumable or combination is approved for a range of steels with different specified minimum strength levels, steel of the highest strength level is to be used for the preparation for the assembly required by 6.3.1.

Section 7

Consumables for use in one-side welding with temporary backing materials

7.1 General

7.1.1 The requirements for approval of combinations including temporary backing material, for use in one-side welding techniques, are dependent on the technique used and which basic technique it most closely follows. The following are provided for:

- Technique m – for manual electrode/backing combinations.
- Technique S – for wire-gas/backing combinations used with semi-automatic multi-run technique.
- Technique M – for wire-flux or wire-gas in combination with backing material (and maybe supplementary filler materials) used with an automatic multi-run technique.
- Technique A – as for M but using a procedure with a high heat input rate (large bead size relative to thickness welded). This would apply to welds made by four or less runs in 20 mm thickness, or eight or less runs in 35 mm.

7.1.2 For technique m, S or M, a single butt weld is to be made in plate of 20–25 mm thickness. For technique A, two butt welds are to be made, one in plate of the maximum thickness recommended by the manufacturer, the other in plate of approximately half the thickness of the first. Usually this will involve thicknesses in the region of 35–40 mm and 20–25 mm respectively.

7.1.3 A wire and gas combination approved with an argon/carbon dioxide shielding gas where the carbon dioxide content is between 15–25 per cent is also approved for other combinations of argon/carbon dioxide, provided the carbon dioxide content is within the range 15–25 per cent. The range of approval is limited to ferritic consumables in solid wire, flux cored and coated wire forms and subject to the agreement of the consumable manufacturer and LR.

7.1.4 Any unrecognised techniques or unusual combinations will be considered for approval subject to a test programme to be agreed based on the details of the technique and combination which are to be submitted in advance.

7.1.5 Where low hydrogen approval is required either by Table 11.7.1 or by the manufacturer, it should be noted that this will generally be achieved through separate testing of:

- the backing material, and
- the welding electrode or combination of wire-flux or wire-gas.

7.1.6 The hydrogen potential of the backing material is to be determined using the modified Gayley-Wooding method which expresses the total hydrogen content as water by weight per cent. The qualifying levels are:

To qualify as:	H ₂ O g/100g sample
H15	0,5
H10	0,3
H5	0,2

7.1.7 The sampling and approval of the combinations without the backing are to follow the general requirements of Sections 3, 4 or 5, as appropriate.

7.1.8 Combinations approved with multi-run technique (m, S and M) for normal and higher strength levels up to and including 'Y' are also considered suitable for welding steels in the three strength levels below that for which they have been approved.

7.1.9 Combinations approved with multi-run technique (m, S and M) for strength levels between Y40 and up to and including Y50 are also considered suitable for welding steels in two strength levels below that for which they have been approved.

7.1.10 Combinations approved with multi-run technique (m, S and M) for strength levels Y55 and above are also considered suitable for welding steels in only one strength level below that for which they have been approved.

7.1.11 Combinations approved for the 'A' multi-run technique are not considered suitable for welding steels of any other strength level with that technique.

7.2 Approval tests for manual (m), semi-automatic (S) and automatic multi-run (M) techniques

7.2.1 For each position to be approved, one butt weld assembly is to be prepared using plates of 20–25 mm thickness as shown in Fig. 11.7.1. The grade of plate used is to be no higher in toughness than that for which approval is required. The strength is to be appropriate to the grade for which welding approval is requested.

7.2.2 The edge preparation and welding conditions are to be in accordance with the recommendations of the manufacturers.

Approval of Welding Consumables

Chapter 11

Section 7

Table 11.7.1 Minimum low hydrogen approval requirements for one-side welding with combinations including temporary backing material

Approval grades	'H' grade for m and S techniques	'H' grade for M technique	'H' grade for A technique
1 (1N), 2 (2N), 3 (3N)	NR	NR	NR
1Y, 2Y, 3Y, 4Y	H15 (see Note 2)	NR	NR
2Y40 to 4Y40	H15	H15	NR
3Y42 to 5Y42	H10	H10	H15
3Y46 to 5Y46	H10	H10	H15
3Y50 to 5Y50	H10	H10	H10
3Y55 to 5Y55	H5	H5	H10
3Y62 to 5Y62	H5	H5	H5
3Y69 to 5Y69	H5	H5	H5
1 ¹ / ₂ Ni	H15	H15	NR
3 ¹ / ₂ Ni	H15	H15	NR
5 Ni (see Note 3)	NR	NR	NR
9 Ni (see Note 3)	NR	NR	NR

NOTES

- NR – Not required, but approval can be sought, if desired.
- Optional in this case. If low hydrogen approval is not obtained, there is a limitation on the carbon equivalent of the steel which is permitted to be welded.
- Assumes the use of an austenitic, non-transformable, filler material.

7.2.3 Test specimens are to be prepared as shown in Fig. 11.7.1 and Fig. 11.7.2(a):

- One longitudinal tensile test specimen (from the centre of the weld).
- Two transverse tensile specimens.
- Two bend test specimens.
- One macrosection.
- Two sets of three Charpy impact test specimens positioned and notched in accordance with Fig. 11.7.2(a). The bend specimens are to be tested, one with the face in tension, the other with the root in tension.

7.2.4 The results of all transverse tensile, bend and impact tests are to comply with the requirements in Table 11.3.3 for m and S technique, and Table 11.4.3 for M technique. The position of fracture of the transverse tensile test is to be reported. The appearance of the bend test specimens is to be in accordance with 3.3.12.

7.2.5 The results of all longitudinal tensile tests are to comply with the requirements in Table 11.3.2.

7.2.6 Low hydrogen approval is required in accordance with Table 11.7.1.

7.2.7 Chemical analyses are to be made and reported from positions corresponding to the weld metal in the upper-most and lowest Charpy specimens. These are to be supplied by the manufacturer and are to include the content of all significant elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

Fig. 11.7.2
Position of Charpy V-notch impact tests for
one-side automatic welding

7.3 Approval tests for high heat input automatic (A) techniques

7.3.1 Two butt weld assemblies are to be prepared, usually one of 35–40 mm thickness, the other 20–25 mm, as shown in Fig. 11.7.1, noting that in the thinner assembly only two sets of Charpy specimens are required. The grade of plates used is to be no higher in toughness than that for which approval is required. The strength is to be appropriate to the grade for which welding approval is requested.

Approval of Welding Consumables

Chapter 11

Sections 7 & 8

7.3.2 The edge preparation and welding conditions are to be in accordance with the manufacturer's recommendations, and are to be reported to LR.

7.3.3 Test specimens as follows are to be prepared as shown in Fig. 11.7.1 and Figs. 11.7.2(a) and (b):

- (a) One longitudinal tensile test specimen (from centre of weld).
- (b) Two transverse tensile test specimens.
- (c) Two bend test specimens.
- (d) One macro-section.
- (e) From assembly 20 to 25 mm thick, two sets of three impact test specimens positioned and notched in accordance with Fig. 11.7.2(a).
- (f) From assembly 35 to 40 mm thick, three sets of three impact test specimens positioned and notched in accordance with Fig. 11.7.2(b).

The bend specimens are to be tested, one with the face in tension, the other with the root in tension.

7.3.4 The results of all transverse tensile, bend and impact tests are to comply with the requirements of Table 11.4.3. The appearance of the bend test specimens is to be in accordance with 3.3.12. The Charpy V-notch impact test requirements are as for the two-run technique in Table 11.4.3.

7.3.5 The results of all longitudinal tensile tests are to comply with the requirements in Table 11.3.2, except that for Grades 1Y, 2Y and 3Y the tensile strength is to be not less than 490 N/mm².

7.3.6 Low hydrogen approval is required in accordance with Table 11.7.1.

7.3.7 Chemical analyses are to be made and reported from positions corresponding to the weld metal in the uppermost and lowest Charpy specimens in the thinner plate weld. This is to be supplied by the manufacturer and is to include the content of all significant elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

7.4 Annual tests

7.4.1 Annual tests are to consist of, at least, one butt weld test assembly, for each technique approved, using plates of 20 to 25 mm thickness.

7.4.2 The assembly is to be prepared and tested in accordance with 7.2 or 7.3, as appropriate, except that only the following tests are required:

- (a) One longitudinal tensile test (from centre of weld).
- (b) One transverse tensile test.
- (c) Two bend tests.
- (d) One set of three impact tests taken from the root of the weld and the specimens notched in accordance with Fig. 11.7.2.
- (e) Chemical analysis (one only).

Section 8 Consumables for welding austenitic and duplex stainless steels

8.1 General

8.1.1 Tests for the approval of consumables intended for welding the austenitic and duplex stainless steels detailed in Ch 3,7 are to be carried out generally in accordance with the Section (3, 4, 5, 6 or 7) relevant to the type of consumable or combination.

8.1.2 Approval will be indicated by the grade or grades of parent stainless steel for which the consumable or combination is approved.

8.1.3 Where a shielding gas is employed separate approval will be required for each specific shielding gas composition.

8.1.4 Consumables for welding the austenitic stainless steels and the duplex stainless steels to carbon or carbon-manganese steels will be approved in a similar manner. Parent plate used for the butt and fillet weld test assemblies will be carbon or carbon-manganese steel with either austenitic stainless steel or duplex stainless steel, as appropriate. Approval will be indicated by 'SS/CMn' and 'Dup/CMn' respectively.

8.1.5 Separate approval will be given for welding chemical and cryogenic applications. For chemical use, evidence of relevant corrosion resistance will be required. Charpy impact toughness tests will be required for all uses, but for cryogenic use the Charpy impact toughness requirements are more severe.

8.1.6 The welding technique will be indicated in the approval grading by a letter:

- m – for manual SMAW or GTAW welding.
- S – for wire-gas combinations used with a semi-automatic multi-run technique.
- M – for wire-flux or wire-gas combinations used with an automatic multi-run technique.
- T – for wire-flux or wire-gas combinations used with an automatic two-run technique.
- A – as for M but using a procedure with a high heat input rate (large bead size relative to thickness welded). This would apply to welds made by four or less runs in 20 mm thickness, or eight or less runs in 35 mm.

8.2 Deposited metal test assemblies

8.2.1 Where the relevant Section requires deposited metal assemblies to be made and tested, the plates used must be either of the type for which approval is required or of normal strength carbon, or carbon-manganese steel with the prepared edges built up with stainless steel weld metal and finished with a layer of weld metal from the consumable to be approved.

Approval of Welding Consumables

Chapter 11

Section 8

8.2.2 The chemical analysis of the deposited weld metal is to be reported, including all significant elements. The elements reported will be dependent on the type of stainless steel for which approval of the consumables is requested. Any unusual weld metal compositions will have to be justified in respect of the particular approval requested. This is to be supplied by the manufacturer and is to include the content of all significant elements. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

8.2.3 The results of all tensile and notch impact tests are to comply with the requirements given in Table 11.8.1 as appropriate.

8.2.4 The ferrite content in the last weld run from each deposited metal assembly is to be determined by physical or metallographic means, and reported, indicating the method of determination.

8.3 Butt weld test assemblies

8.3.1 Where the relevant Section requires butt weld assemblies to be made and tested, the plates used are to be either of the type for which approval is required or of steel having strength and ductility within the range specified for the grade to be approved. In the latter case, provided the consumable is metallurgically compatible with the base material to be used, the prepared edges are to be built up with a layer of weld metal before final machining of the weld preparation.

8.3.2 The results of transverse tensile, notch impact and bend tests are to comply with the requirements of Table 11.8.2 as appropriate. The position of fracture is to be reported to LR.

8.3.3 The ferrite content at the centre of the weld metal in each butt weld assembly is to be determined by physical or metallographic means, and meet the requirements in Table 11.8.2. The method of determination is to be reported.

8.3.4 For austenitic and duplex stainless steel approvals (except for types 304L, 316L, 321 and 347), an appropriate sample from each butt weld assembly is to be submitted to the corrosion testing provided in ASTM G48, Method 'C'. The results are to be reported so as to allow confirmation of the maximum acceptable pitting corrosion resistance temperature. This will be part of the approval grading and will be set at 5°C intervals. The minimum pitting corrosion temperature would not be expected to be less than 20°C.

8.4 Fillet weld test assemblies

8.4.1 Where the relevant Section requires fillet weld assemblies to be made and tested, the plates used must be either of the type for which approval is required or of steel having strength and ductility within the range specified for the grade to be approved. In the latter case, the surfaces on which the fillet weld beads are to be deposited are to be cut back by machining and then built up to original dimensions with weld metal from the consumable to be approved.

8.4.2 The ferrite content at the centre of the weld metal in each fillet weld bead of each assembly is to be determined from the centre macro-section by physical or metallographic means, and reported. The method of determination is also to be reported to LR.

Table 11.8.1 Requirements for deposited metal tests (manual, semi-automatic and automatic multi-run techniques)

Grade	0,2% proof stress N/mm ² minimum	1% proof stress N/mm ² minimum	Tensile strength N/mm ² minimum	Elongation on 50 mm % minimum	Charpy V-notch impact tests

S 32760	750	6	35–65	–20		40
Dup/CMn	500	3	(see Note 2)	–20	(see Note 3)	40

NOTES

1. Energy values from individual impact test specimens are to comply with 1.4.3.
2. To be reported for special consideration.
3. Approval for cryogenic applications is to be obtained at the procedure approval stage.

8.4.3 Where approval is sought for fillet welding only, corrosion testing is to be carried out in accordance with 8.3.4 from a sample taken from the deposited metal test assembly.

8.5 Annual tests

8.5.1 Annual tests are to be carried out as required by the relevant Section appropriate to the type of consumable and welding technique. The tests are to include a weld ferrite content in accordance with 8.3.3.

8.5.2 The results of all tests are to comply with the requirements given in Table 11.8.1 and Table 11.8.2 as appropriate.

Section 9 Consumables for welding aluminium alloys

9.1 General

9.1.1 Tests for the approval of consumables intended for welding the aluminium alloys detailed in Chapter 8 are to be carried out generally in accordance with the requirements of Sections 1, 2 and 5, except as otherwise detailed in this Section.

9.1.2 Approval will be indicated by the grade shown in Table 11.9.1.

Table 11.9.1 Requirements for butt weld tests

Consumable Approval Grade (see Note 1)	Base material used for the test	Tensile strength N/mm ² minimum	Bend test ratio $\frac{D}{t}$
LR RA/LR WA	5754	190	3
LR RB/LR WB	5086	240	6
LR RC1/LR WC1	5083	275	6
LR RC2/LR WC2 (see Note 2)	5383 or 5456	290	6
LR RC3/LR WC3 (see Note 2)	5059	330	6
LR RD/LR WD (see Note 4)	6005A 6061 6082	170 170 170	6 6 6

NOTES

1. The prefixes 'R' and 'W' indicate 'rod' form (for Gas Tungsten Arc Welding (GTAW)) or 'wire' form (for Gas Metal Arc Welding (GMAW) and GTAW).
2. Approval of grade LR RC2/LR WC2 confers approval of 5383, 5456 and 5083 base material grade.
3. Approval of grade LR RC3/LR WC3 confers approval of 5059, 5383, 5456 and 5083 base material grades.
4. Approval of grade LR RD/LR WD confers approval of 6005A, 6061 and 6082 base material grades.

Approval of Welding Consumables

Chapter 11

Section 9

9.1.3 The welding technique will be indicated in the approval grading by a letter:

- m – manual multi-run welding (GTAW),
- S – semi-automatic multi-run welding (GMAW),
- M – automatic multi-run welding (GTAW or GMAW),
- T – automatic two-run welding (GMAW).

9.1.4 The compositions of the shielding gas and the filler/electrode wire are to be reported.

9.1.5 Approval granted using the multi-run technique for a specific filler/electrode wire with a gas in one of the groups listed in Table 11.9.2 will extend to any other gas compositions within that same group, provided that the gas composition is within the range recommended by the consumable manufacturer, subject to agreement with LR.

Table 11.9.2 Shielding gas compositions

Group	Gas composition (Vol. %) (see Note)	
	Helium	Argon
I-1	–	100
I-2	100	–
I-3	>0 ≤33	Remainder
I-4	>33 ≤66	Remainder
I-5	>66 ≤95	Remainder
S	Special gas	

NOTE
Gases of other composition (mixed gases) or special purity may be considered as special gases and will require separate approval tests.

9.1.6 Approval granted for the two-run technique will be for a specific shielding gas composition; additional tests may be required if a change in shielding gas composition is sought.

9.1.7 On completion of welding, assemblies are to be allowed to cool naturally to ambient temperature. Welded test assemblies and test specimens are not to be subjected to any heat treatment after welding except for the alloy Grades 6005A, 6061 and 6082. These are to be allowed to naturally age at ambient temperature for a period of 72 hours from the completion of welding, before testing is carried out. A second solution heat treatment is not permitted.

9.1.8 All butt test assemblies are to be subjected to both radiographic and visual examination and imperfections such as lack of fusion, lack of penetration, cavities, inclusions, pores and cracks assessed in accordance with Intermediate Level C of ISO 10042, aided where necessary by dye penetrant and ultrasonic examination.

9.1.9 Fillet weld test assemblies and macro-sections are to be visually examined for imperfections, such as lack of fusion, lack of penetration, cavities, inclusions, pores and cracks, in accordance with Intermediate Level C of ISO 10042, aided where necessary by radiographic and dye penetrant examination.

9.2 Approval tests for manual, semi-automatic and automatic multi-run techniques

9.2.1 Plate of the corresponding type of aluminium alloy and of appropriate thickness is to be used for the preparation of the weld test assemblies.

9.2.2 The welding parameters are to be within the range recommended by the manufacturer and are to be reported.

9.2.3 Welded assemblies are to be prepared and tested in accordance with 9.3, 9.4 and 9.5.

9.3 Deposited metal test assembly

9.3.1 One assembly is to be prepared in the downhand position as shown in Fig. 11.9.1.

Fig. 11.9.1 Deposited metal test assembly

9.3.2 The chemical composition of the plate used for the assembly is to be compatible with the weld metal.

9.3.3 The thickness of the plate used, and the length of the assembly, are to be appropriate to the welding process. The plate thickness is to be not less than 12 mm.

9.3.4 For the approval of filler wire/gas and electrode wire/gas combinations for manual or semi-automatic welding by GTAW or GMAW, one test assembly is to be welded using any size of wire within the range for which approval is sought.

9.3.5 For automatic multi-run approval, one test assembly is to be welded by the respective process using the recommended diameter of wire.

Approval of Welding Consumables

Chapter 11

Section 9

9.3.6 The weld metal is to be deposited in multi-run layers in accordance with normal practice. The direction of deposition of each layer is to alternate from each end of the plate.

9.3.7 The deposited weld metal in the assembly is to be analysed and reported including the contents of all significant elements. The elements reported will be dependent on the type of aluminium alloy for which approval of the consumables is requested. The results of the analysis are not to exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

9.4 Butt weld test assemblies

9.4.1 Plate of the corresponding type of aluminium alloy and of an appropriate thickness is to be used for the preparation of the test assemblies.

9.4.2 In order to ensure sound and representative welds, it is essential that test assemblies are cleaned and degreased prior to welding. Assemblies as shown in Fig. 11.9.2 are to be prepared for each welding position (downhand, horizontal-vertical, vertical-upward, vertical-downward, and overhead) for which the consumable is recommended by the manufacturer; except that consumables satisfying the requirements for downhand and vertical-upward positions will be considered as also complying with the requirements for the horizontal-vertical position. Any wire diameter(s) to be approved may be used.

9.4.3 One assembly, as shown in Fig. 11.9.3, is to be prepared for welding in the downhand position. The assembly is to be welded using, for the first run, wire of the smallest diameter recommended by the manufacturer and, for the remaining runs, wire of the largest diameter to be approved.

9.4.4 The welding conditions are to be in accordance with the recommendations of the manufacturer and are to be reported in detail.

9.4.5 The welded assemblies are to be subjected to NDE. Imperfections are to be assessed in accordance with 9.1.8.

9.4.6 The test specimens are to be taken from the welded assemblies as shown in Fig. 11.9.2 and Fig. 11.9.3. For each assembly they are to comprise:

- 2 transverse tensile specimens;
- 2 face bend specimens; and
- 2 root bend specimens.

9.4.7 All tensile test specimens are to have a tensile strength not less than the respective value shown in Table 11.9.1. The position of each fracture is to be reported.

9.4.8 The bend test specimens are to be bent around a former having a diameter not more than the number of times the thickness of the test specimen, as shown in Table 11.9.1, and can be considered as complying with the requirements if, after bending to an angle of not less than 180°, no crack or other open defect exceeding 3 mm in length can be seen on the outer surface. Flaws appearing at the corners of a test specimen may be ignored.

Fig. 11.9.2
Butt weld test assembly
(positional, multi-run technique)

9.4.9 In order to obtain uniform bending of the bend test specimens, it is recommended that the wrap-around or guided bend test using a roller method is employed.

9.5 Fillet weld test assembly

9.5.1 One assembly is to be prepared and welded in the horizontal-vertical position and tested in accordance with the appropriate requirements of 3.5, except that the plates are to be of an aluminium alloy compatible with the weld metal, that no hardness tests are required and that for automatic multi-run approval only one fillet weld bead is to be made using the recommended wire diameter. In this case, the bead size is to be as large as the maximum single bead size recommended by the manufacturer for fillet welding.

9.5.2 The results of examination of the macro-specimens and the fractured fillet welds are to be reported in accordance with 3.5.3 and 3.5.5. Imperfections are to be assessed in accordance with 9.1.9.

Approval of Welding Consumables

Chapter 11

Section 9

Fig. 11.9.3
Butt weld test assembly
(downhand, multi-run technique)

9.6 Approval tests for two-run technique

9.6.1 Two butt weld test assemblies are to be prepared using the following plate thicknesses:

- one with the maximum thickness for which approval is requested,
- one with a thickness approximately one half to two thirds that of the maximum thickness.

9.7 Butt weld test assemblies (two-run technique)

9.7.1 The plates used are to be of the aluminium alloy appropriate to the approval required as shown in Table 11.9.1. The composition of the plate material is to be within the range specified for that alloy in Table 8.1.3 in Chapter 8 and is to be reported including all significant elements.

9.7.2 The wire diameter, edge preparation, welding current, arc voltage and travel speed are to be in accordance with the manufacturer's recommendations and are to be reported.

9.7.3 Each butt weld is to be made in two runs, one from each side. After completion of the first run, the assembly is to be left in still air until it has cooled to less than 50°C.

9.7.4 The welded assemblies are to be subjected to NDE. Imperfections are to be assessed in accordance with 9.1.8.

9.7.5 The test specimens as shown in Fig. 11.9.4 are to be prepared from each test assembly. The edges of the discards are to be polished and etched, and must show complete fusion and inter-run penetration of the welds. Each cut in the assembly is also to be examined to confirm that complete fusion and penetration have been achieved.

Fig. 11.9.4
Butt weld test assembly (two-run technique)

9.7.6 The results of the transverse tensile tests are to be as in 9.4.7 and of the bend tests as in 9.4.8. The position of the fracture in each transverse tensile specimen is to be reported.

9.8 Annual tests

9.8.1 Annual tests are to consist of the following:

- for combinations approved for the multi-run technique, one deposited metal assembly in 9.3 and one downhand butt assembly in 9.4;
- for combinations approved for the two-run technique, one butt weld assembly in plate material of thickness equal to one half to two thirds that of the maximum thickness approved.

9.8.2 For the automatic two-run technique, one butt weld assembly is to be prepared and tested in accordance with 9.7.

Welding Qualifications

Chapter 12

Sections 1 & 2

Section

- 1 **General qualification requirements**
- 2 **Welding Procedure Qualification Tests for Steels**
- 3 **Specific requirements for stainless steels**
- 4 **Welding procedure tests for non-ferrous alloys**
- 5 **Welder qualification tests**

■ Section 1 General qualification requirements

1.1 General

1.1.1 This Section applies to all welding qualifications and tests required to be performed in the course of new construction, conversions, modifications or repairs made on ships, other marine structures and their associated pressure vessels, machinery and equipment.

1.1.2 These Rules also apply to all welding work related to other applications for which Lloyd's Register (hereinafter referred to as LR) have issued Rules or have an interest.

1.1.3 It is the responsibility of the manufacturer to ensure compliance with all aspects of these Rules. All deviations are to be recorded as non-compliances and brought to the attention of the Surveyor along with the corrective actions taken. Failure to do this is considered to render the welding tests as not complying with the Rules.

1.1.4 Welding tests are to be performed under survey at the manufacturer's works. Welding procedure qualification tests and welder qualifications tests are to be performed and approved prior to commencement of fabrication or construction.

1.1.5 Weld procedure tests made in accordance with EN, ISO, JIS, ASME or AWS may be considered for acceptance provided that, as a minimum, they are equivalent to and meet the technical intent of these Rules to the satisfaction of the Surveyor.

1.1.7 The responsibility for the performance of the weld tests rests with the manufacturer. Aspects of the welding tests, such as mechanical testing, non-destructive testing and heat treatment, may be subcontracted by the manufacturer provided that the subcontractor performs the work under the technical control and direction of the manufacturer, and this is agreed with the Surveyor prior to commencing the work.

1.1.8 In these Rules, the term 'manufacturer' is considered to include any firm or organisation that performs welding and is considered to be the shipbuilder, or construction firm, or fabricator, or material manufacturer.

1.2 Design

1.2.1 Welding procedure qualification tests are required to give assurance that construction welds made in accordance with the approved plans or the approved design have acceptable properties. It is the manufacturer's responsibility to establish and document whether a procedure is suitable for a particular application.

1.2.2 The requirements relate to mechanical properties of the weld and heat affected zone, however, other tests may be required on certain materials, for example, corrosion or fatigue tests, in order to ensure suitability for the proposed application.

1.3 Materials

1.3.1 Materials used for testing are to be of the same grade, type and from the same manufacturing process as those to be used for construction, unless prior agreement is obtained from the Surveyor. Such agreements will only apply on a case-by-case basis.

1.3.2 All materials used for testing are to be suitably marked and identifiable to the original manufacturer's material certificate.

1.4 Performance of welding tests

1.4.1 All welding and subsequent testing is to be performed in accordance with the requirements of this Chapter.

1.4.2 The manufacturer is responsible for monitoring the tests and for recording all the welding variables as specified in 2.2 and for compiling all the non-destructive examination (NDE) reports and mechanical test records for submission to the Surveyor.

1.4.3 The laboratory or testing establishment used to perform the tests is to have the necessary equipment, maintained in good order and suitably calibrated. The Surveyor is to be satisfied that the laboratory personnel have the appropriate skills and are appropriately qualified in accordance with Ch 2, 1.2.1.

■ Section 2 Welding Procedure Qualification Tests for Steels

2.1 General

2.1.1 The requirements of this Section relate to welding procedure test requirements of carbon, carbon-manganese steels and low alloys steels. Additional requirements for austenitic and austenitic/ferritic duplex stainless steels, aluminium and copper alloys are specified in Sections 3 and 4 respectively.

Welding Qualifications

Chapter 12

Section 2

2.1.2 Prior to performing the welding procedure qualification test, the manufacturer is to present to the Surveyor a preliminary Welding Procedure Specification (pWPS) detailing the welding processes, positions, joint types, materials and heat treatments to be performed during the test. The pWPS is to be presented for information prior to commencing the test.

2.1.3 The type and extent of testing to be applied to each welding procedure test is to be in accordance with subsequent Sections of this Chapter.

2.1.4 For the welding procedure approval, the welding procedure qualification tests given in this Section are to be carried out with satisfactory results. Welding procedure specifications are to refer to the test results achieved during welding procedure qualification testing.

2.2 Welding variables

2.2.1 In order that the conditions of the qualification test may be applied to production welding operations, the appropriate variables are to be recorded by the manufacturer during welding and testing from the following list:

- The unique qualification reference number and the date of welding;
- The material type, grade, product form, dimensions and identification;
- Welding process(es), including tack welds;
- Joint type, dimensions and surface condition;
- Welding position(s);
- Welding technique(s), weaving, multiple electrodes, etc;
- Welding consumables including fluxes, shielding gases, etc;
- Control of consumables, baking or drying conditions, etc;
- Welding parameters, current, voltages, travel speeds, etc;
- Number and sequence of weld runs;
- Backing materials including any backing gas;
- Preheats and interpass temperatures;
- Methods used for cleaning and inspection of root deposits;
- Post-weld heat treatment, temperature and cycle times;
- Special weld profiling requirements.

2.2.2 Other variables may need to be recorded depending on the particular welding process or application and are to be agreed with the Surveyor, for example the peak and base current and cycle times for pulse welding, electrode type and nozzle size for GTAW welding, etc.

2.3 Steel test assemblies

2.3.1 Tests are to be performed using the welding process and positions anticipated for actual construction. The weld test assemblies are to be representative of construction conditions and are to be welded in the same manner as intended for the actual production welds. Where pre-fabrication primers are used in the shipyard, these are to be included in the test assemblies.

2.3.2 For plate tests, the direction of plate rolling relative to the weld direction is to be considered. Where the material used for the test requires longitudinal impact tests, the plate rolling direction is to be perpendicular to the weld direction and for material which requires impact testing in the transverse direction, the rolling direction is to be parallel to the weld direction.

2.3.3 Typical test assemblies are shown in Fig. 12.2.1(a) to (c). These are a minimum requirement to permit the removal of all the necessary mechanical test specimens. Where impact tests or other toughness tests are required, the total width is not to be less than 8 times the material thickness of the thicker material being joined.

Fig. 12.2.1(a) Butt weld test assembly in plate

2.3.4 Welding procedure test assemblies are to be welded separately from production welds and are to be marked with the unique test identification number. The individual pieces of the test assembly may be held together to maintain their relative joint conditions by means of suitable tack welds, clamps or strongbacks.

2.3.5 Welding of the test assemblies and testing of test specimens is to be monitored by the Surveyor.

2.3.6 The test assembly is to be placed in one of the welding positions shown in Fig. 12.2.2(a) to (d), as specified in the test Welding Procedure Specification (pWPS) and the specified level of preheat applied prior to the start of welding.

2.3.7 Designations for equivalent welding positions shown by different standards are shown in Table 12.2.1.

Welding Qualifications

Chapter 12

Section 2

Fig. 12.2.1(b) Butt weld test assembly in pipe

Fig. 12.2.1(c) Fillet weld test assembly in plate

2.4 Welding of steel test assemblies

2.4.1 Welding of the test assembly is to be carried out in accordance with the agreed pWPS. Where, during the progress of the test, it is found necessary to change the conditions specified on the pWPS, this is to be brought to the attention of the Surveyor. If agreed, the test may be permitted to continue with the new conditions and these are to be recorded.

2.4.2 Where the production work requires welding over tack welds, the test is to simulate this condition and the tack welds are to be included in the inspection length of the test weld and their position recorded.

2.4.3 For manual and semi-automatic welding processes, weld stops and re-starts are to be included in the inspection length of the test weld.

Table 12.2.1 Equivalent designations of welding positions

Weld position		Standard	
		ISO 6947	AWS
Plate butt welds			
Flat	D	PA	1G
Horizontal	X	PC	2G
Vertical, weld up	Vu	PF	3G
Vertical, weld down	Vd	PG	3G
Overhead	O	PE	4G
Pipe butt welds			
Pipe horizontal, rotated, weld horizontal	D	PA	1G
Pipe vertical, not rotated, weld horizontal	X	PC	2G
Pipe horizontal, not rotated, weld flat, vertical and overhead	D+Vu+O D+Vd+O	PF	5G
Pipe inclination fixed, not rotated	45°	H-L045 J-L045	6G
Plate fillet welds			
Flat	D	PA	1F
Horizontal	X	PB	2F
Vertical up	Vu	PF	3F
Vertical down	Vd	PG	3F
Overhead	O	PD	4F
Pipe fillet welds			
Flat, pipe rotated	D	PA	1FR
Horizontal, pipe fixed	X	PB	2F
Horizontal, pipe rotated	D	PB	2FR
Overhead, pipe fixed	O	PD	4F
Multiple, pipe fixed	D+Vu+O D+Vd+O	PF PG	5F

2.4.4 Fillet weld test assemblies are welded on one side only.

2.4.5 Where the construction welding is predominately fillet welding, in addition to the butt weld qualification test, a fillet weld qualification test is to be performed to confirm that acceptable weld quality is achieved.

Fig. 12.2.2(b) Pipe butt weld test positions

**2.5 Non-destructive examination (NDE)**

2.5.1 On completion of welding, prior to sectioning for mechanical tests, the inspection length of the test assembly is to be subjected to both visual examination and surface crack detection.

2.5.2 Butt weld assemblies are also to be subjected to radiographic or ultrasonic examination over the whole inspection length of the weld.

2.5.3 For welds in steels with specified yield strength up to 400 N/mm², and with carbon equivalent less than or equal to 0,41 per cent, NDE may be performed as soon as the test assembly has cooled to ambient temperature. For other steels, NDE is to be delayed for a period of at least 48 hours after the test assembly has cooled to ambient temperature.

2.5.4 Where post-weld heat treatment is required, NDE is to be performed after the heat treatment is complete.

2.5.5 NDE is to be performed in accordance with procedures acceptable to LR. Assessment of results is to be in accordance with ISO 5817 Level B except for excess convexity and excess throat thickness where Level C will apply.

2.5.6 As an alternative to radiography, ultrasonic examination may be carried out and acceptance criteria that are considered to result in equivalent weld quality are to be agreed, with the Surveyor, prior to the tests being carried out. Ultrasonic testing will be subject to the thickness limitation specified in Ch 13,2.12.5.

2.5.7 Where the test assembly does not satisfy the non-destructive examination acceptance criteria, the test is to be rejected. A duplicate test assembly may be welded using the original welding conditions. If this fails NDE, the welding procedure is to be considered as incapable of achieving the requirements without modification.

2.5.8 Subject to prior agreement with the Surveyor, where unacceptable imperfections are of a volumetric nature and are localised in one small area of the test assembly, the test may be permitted to continue and specimens for destructive testing may be removed, avoiding this area.

Welding Qualifications

Chapter 12

Section 2

Fig. 12.2.2(d) Pipe fillet weld test positions

2.6 Destructive tests – General requirements

2.6.1 The weld test assembly may only be sectioned for destructive testing after any heat treatment and the required non-destructive examinations have been completed successfully.

2.6.2 The dimensions of the test specimens and testing conditions are to be in accordance with the requirements specified in Chapter 2.

2.6.3 The results of destructive tests are to be assessed in accordance with the acceptance criteria specified in 2.12, unless other, more stringent requirements are specified for the application.

2.6.4 Where a weld test is made between materials of different grades, the acceptance criteria that are to be applied are those applicable to the lower grade material.

2.7 Destructive tests for steel butt welds

2.7.1 The test assembly is to be sectioned for mechanical testing in accordance with Figs. 12.2.3 or 12.2.4.

2.7.2 The longitudinal all weld metal tensile test specimen is to be of circular cross-section as detailed in Ch 11,2.1.1. Where more than one welding process or type of consumable has been used to make the weld, test specimens are to be removed from each respective area of the weld. This does not apply to the process or consumables used to make the root or first weld run. During the test, the yield or proof stress, ultimate tensile strength, and elongation to failure are to be recorded.

2.7.3 Where approved welding consumables have been used, the longitudinal all weld metal tensile test may be omitted.

2.7.4 The transverse tensile test specimen is to be of full thickness with the dimensions shown in Ch 11,2.1.1. The tensile strength and fracture locations are to be reported.

Welding Qualifications

Chapter 12

Section 2

Test requirements

- A One macro including hardness survey
- B All weld metal tensile test
- C Four bend tests.
Two root bends and two face bends for thickness up to 12 mm.
For thickness above 12 mm four side bends
- D Two transverse tensiles
- E Five sets of Charpy V-notch impact tests, notched at the following positions:
 - 1 set at weld centre
 - 1 set at fusion line (FL)
 - 1 set at FL + 2 mm
 - 1 set at FL + 5 mm (if required by Figs. 12.2.6 and 12.2.7)
 - 1 set at FL + 10 mm (if required)

2665/07

Fig. 12.2.3

Butt welds in plate and pipe over 750 mm diameter

The diameter of the test piece is to be a minimum of $D/2$ where
 D is the maximum diameter of the pipe to be welded in construction

Test requirements

- A Visual examination
- B Surface crack detection
- C 100% radiographic examination
- D Two transverse tensile tests
- E Four bend tests.
Four side bends for thickness greater than 12 mm.
In other cases, two face and two root bends
- F Four sets Charpy V-notch impact tests
 - 1 set notched at centre of weld
 - 1 set notched at fusion line (FL)
 - 1 set notched at FL + 2 mm
 - 1 set notched at FL + 5 mm (if required by Figs. 12.2.6 and 12.2.7)
- G One macro specimen including hardness survey

Fig. 12.2.4

Butt welds in pipe less than 750 mm diameter

2.7.5 Where the maximum load required to fracture the transverse tensile specimen is likely to exceed the capacity of the tensile testing equipment, several tensile specimens may be removed through the thickness and tested. Specimens are to be prepared such that they overlap in the thickness direction so that the full plate thickness is tested.

Welding Qualifications

Chapter 12

Section 2

2.7.6 Transverse bend specimens of rectangular section are to be prepared with the weld centred in the middle of the specimen as shown in Fig. 12.2.5. For material of thickness 12 mm or greater, the face and root bends may be substituted by side bend tests. The weld reinforcement may be removed by grinding or machining prior to testing and the edges rounded to a radius not exceeding 10 per cent of the specimen thickness. Each specimen is to be bent through an angle of at least 180°. The bend test ratio is to be the lesser of the following:

(a) $D_f = (D/t) + 1$

or

(b) $D_f = 100/E_m$ (rounded up to the next whole number) where

D_f = is the bend test ratio

(D/t) = is the value from Tables 11.3.3, 11.4.3 or 11.8.2 in Chapter 11, as appropriate

E_m = is the minimum specified percentage elongation for the test material (based on a proportional gauge length of $5,65 \sqrt{S_0}$)

Fig. 12.2.5 Transverse bend test specimens

2.7.7 Where the weld test is made between different material types, the requirements of 2.7.8 are to be applied to the material with the lower toughness specification.

2.7.8 For hull structural steels, impact test specimens are to be prepared from the locations shown in Figs. 12.2.6 or 12.2.7, with the notch perpendicular to the plate surface and have the dimensions and proportions in accordance with Ch 2.3. Where more than one welding process or type of consumable has been used to make the weld, test specimens are also to be removed from these respective parts of the weld. Note that this does not apply to the welding process or consumables used solely to make the root or first weld run. Where the weld thickness exceeds 50 mm, an additional set of impact tests is required from the root area of the weld irrespective of whether different welding process or welding consumables are used as shown in Figs. 12.2.6 and 12.2.7.

2.7.9 For offshore structures and pressure vessels, impact test specimens are not required to be notched at the FL + 10 mm location. Where more than one welding process or type of consumable has been used to make the weld, test specimens are to be removed from the respective areas of the weld. This does not apply to the process or consumables used solely to make the root or first weld run.

2.7.10 At least one macro examination specimen is to be removed from the test plate, near the end where welding started. The specimen is to include the complete cross-section of the weld and the heat affected zone and be prepared and etched to clearly reveal the weld runs and the heat affected zone. Examination is to be performed under a magnification of between x5 and x10.

2.7.11 A chemical analysis of the weld metal is to be performed on the macro specimen where approved welding consumables have not been used. The results are to comply with the limits given in the welding consumable specification.

2.7.12 A Vickers hardness survey is to be performed on the macro specimen taken from the weld start end of the test assembly in accordance with that shown in Fig. 12.2.8, using a test load not in excess of 10 kg. For each row of indents, there are to be a minimum of 3 individual indentations in the weld metal, the heat affected zones (both sides) and the base metal (both sides). The recommended distance between indents is 1,0 mm, but the distance between indents should not be less than the minimum specified in ISO 6507/1.

2.8 Destructive tests for steel fillet welds

2.8.1 Fillet weld test assemblies are to be sectioned for destructive testing in accordance with Fig. 12.2.1(c) and as follows:

- (a) two fracture tests;
- (b) three macro-sections;
- (c) one hardness survey.

2.8.2 Two fracture test specimens are to be removed from the test weld and are to be subjected to testing by bending the upright plate onto the through plate to produce fracture, as shown in Fig. 12.2.1(c).

2.8.3 At least three macro examination specimens are to be removed from the test plate. The specimens are to include the complete cross-section of the weld and the heat affected zone and is to be prepared to clearly reveal the weld runs and the heat affected zone. One of the specimens is to include a weld stop/start position. Examination is to be performed under a magnification of between x5 and x10.

2.8.4 A Vickers hardness survey is to be performed on the macro specimen taken from the weld start end of the test assembly in accordance with that shown in Fig. 12.2.9, using a test load not exceeding 10 kg.

(a) $t \leq 50$ mm, see Note

NOTE

For one side single run welding over 20 mm notch location 'a' is to be added on root side

(a) $t > 50$ mm

Notch locations:

- a : centre of weld 'WM'
- b : on fusion line 'FL'
- c : in HAZ, 2mm from fusion line

Fig. 12.2.6 Locations of V-notch for butt weld of normal heat input (heat input ≤ 50 kJ/cm)

2.9 Destructive tests for T, K, Y steel nozzle welds

2.9.1 Full penetration 'T', 'K' and 'Y' joints for structural applications and nozzle welds for pressure vessels are to be sectioned for testing in accordance with Fig. 12.2.10 and tested as detailed below:

- (a) three macro specimens;
- (b) impact tests from the weld, fusion line and fusion line + 2 (where the material thickness permits);
- (c) one hardness survey.

In addition, butt weld tests are to be performed in accordance with 2.7, using the same welding conditions, in order to verify acceptable weld and heat affected zone properties.

2.9.2 The impact tests are to be removed from the vertical (up) position 'B' in Fig. 12.2.10 and tested in accordance with 2.7.8.

2.9.3 A Vickers hardness survey is to be performed on the macro-section removed from position 'A' or 'C' in accordance with that shown in Fig. 12.2.11 using a test load not exceeding 10 kg.

2.10 Destructive tests for steel pipe branch welds

2.10.1 Pipe branch welds may be by either full penetration, partial penetration or fillet welded, depending on the application and the approved plans. Where these types of welded joints are used, tests are to be performed which simulate the construction conditions.

2.10.2 The test weld assembly is to simulate the smallest angle between the branch and main pipe and is to be subjected to macro-examination and hardness testing, as follows:

- (a) For a branch weld that is full penetration, testing is to be performed in accordance with the requirements for 'T', 'K' and 'Y' joints in 2.9.
- (b) For a branch weld that is either a partial penetration or fillet weld, testing is to be in accordance with the requirements for fillet welds in 2.8.

(a) $t \leq 50$ mm, see Note

NOTE

For one side welding with thickness over 20 mm notch location 'a', 'b' and 'c' are to be added on root side

(a) $t > 50$ mm

Notch locations:

- a : centre of weld 'WM'
- b : on fusion line 'FL'
- c : in HAZ, 2 mm from fusion line
- d : in HAZ, 5 mm from fusion line
- e : in HAZ, 10 mm from fusion line in case of heat input > 200 kJ/cm

Fig. 12.2.7 Locations of V-notch for butt weld of high heat input (heat input > 50 kJ/cm)

2.11 Destructive tests for weld cladding of steel

2.11.1 Where weld cladding or overlay is allowed by Chapter 13, and is considered as providing strength to the component to which it is welded, the type and location of test specimens are to be in accordance with Fig. 12.2.12, except that micro-sections are not required. Impact tests may be omitted where the base material does not have specified impact properties. The longitudinal tensile and bend tests are to be tested in a similar manner to transverse specimens specified in 2.7.2 and 2.7.6, respectively.

2.11.2 Where the weld cladding is not considered as contributing to the strength of the component, but is required for corrosion or wear resistance, the type and location of test specimens are to be in accordance with Fig. 12.2.12, except that tensile and impact tests are not required.

2.11.3 Where the weld cladding is applied for corrosion resistance, in addition to the above, weld metal analysis is to be performed on one of the micro-sections, on a surface parallel to the weld surface but 2 mm deep. The analysis is to be within the limits specified for the corrosion resistance required.

2.12 Mechanical test acceptance criteria for steels

2.12.1 Longitudinal all weld metal tensile test:

- (a) In general, the longitudinal all weld tensile test is to meet the minimum properties specified in Tables 11.3.2 or 11.4.2 in Chapter 11, as appropriate to the grade of steel and welding process used in the test.
- (b) Where the application is such that no consumable approvals are specified in Chapter 11, the longitudinal all weld tensile test is to meet the minimum properties specified for the base materials used in the test.
- (c) For pressure vessels manufactured from carbon or carbon/manganese steels, the tensile strength from the longitudinal all weld tensile test is not to be less than the minimum specified for the plate material and is not to be more than 145 N/mm² above this value, see Ch 13.4.8.3.

2.12.2 Transverse tensile test: The tensile strength measured from the transverse tensile test is not to be less than the minimum specified for the base material used in the test.

Fig. 12.2.8 Hardness testing locations for butt welds

2.12.3 Bend tests:

- In general, bend tests are to exhibit no defects exceeding 3,0 mm measured in any direction across the tension face of the specimen after being bent over the required diameter of former to the appropriate angle.
- Bend tests for pressure vessel applications are to exhibit no defects exceeding 3,0 mm measured along the specimen or 1,5 mm measured transverse to the specimen axis, after bending.
- In all cases, premature failure of the bend tests at the edges of the specimen is to not be cause for rejection unless these are associated with a weld defect.

2.12.4 Impact toughness tests:

- Impact test specimens for hull construction are to be tested at the temperature, and are to achieve the minimum impact energy, as specified in Table 12.2.2.
- Impact test specimens for applications other than hull construction are to be tested at the same temperature and achieve the same minimum energy values, as specified for the base materials used in the test.
- Impact test acceptance criteria are to be in accordance with the above unless the Rules applicable to the particular construction specify more stringent requirements.
- For quench and tempered steels, the required test temperature and absorbed energy are to be in accordance with that specified for the parent materials.

Fig. 12.2.9 Hardness test locations for fillet welds

Location of macro-examination test specimens for T, K and Y joints

Welding Qualifications

Chapter 12

Section 2

Test specimens

- 1 Longitudinal tensile test to include the weld metal, heat affected zone (HAZ) and base metal.
- 2 Longitudinal side bend test to include the weld metal, heat affected zone (HAZ) and base metal.
- 3 Weld metal Charpy V notch impact test.
- 4 HAZ Charpy impact test from Fusion Line and Fusion Line + 2 mm.
- 5 Longitudinal macro-section and hardness survey.
- 6 Transverse micro-section.

NOTE

In the case of shafts and pipes of circular section, the longitudinal direction is parallel to the centreline of the shaft or pipe axis.

Fig. 12.2.12 Type and location of test specimens for weld cladding

Table 12.2.2 Impact test requirements for butt joints ($t \leq 50$ mm) see Notes 1 and 2

Grade of steel	Test temperature (°C)	Value of minimum energy absorbed (J)		
		Manual or semi-automatic welded joints		Automatically welded joints
		Downhand, Horizontal, Overhead	Vertical upward, Vertical downward	
A, see Note 3 B, see Note 3, D E A32, A36 D32, D36 E32, E36 F32, F36	20 0 -20 20 0 -20 -40	47	34	34
A40 D40 E40 F40	20 0 -20 -40		39	39
> 40	As specified for parent material	As specified in Ch 11,4.3		

NOTES

1. For thickness above 50 mm, impact test requirements are to be specially agreed.
2. These requirements are to apply to test piece of which butt weld is perpendicular to the rolling direction of the plates.
3. For grade A and B steels average absorbed energy on fusion line and in heat affected zone is to be a minimum of 27 J.

2.13 Failure to meet requirements

2.13.1 Where a tensile, bend or hardness specimen fails to meet requirements, further test specimens may be removed and tested in accordance with the requirements of Ch 2,1.4.1.

2.13.2 Where an impact specimen fails to meet requirements, a further set of three specimens may be removed and tested in accordance with the requirements of Ch 2,1.4.4.

2.13.3 Where a macro specimen reveals a defect that is planar in nature, the welding procedure test is to be considered as not satisfying the requirements and a new test assembly is required.

Welding Qualifications

Chapter 12

Section 2

2.13.4 Where a macro specimen does not meet requirements as a result of a volumetric imperfection exceeding the permitted size, two additional specimens may be removed from the same test weld and examined. If either of these macro-sections also fails to satisfy the requirements, the welding procedure is to be considered as not having met the requirements.

2.13.5 If there is a single hardness value above the maximum values specified, additional hardness tests are to be carried out, either on the reverse of the specimen, or after sufficient grinding of the tested surface. None of the additional hardness values is to exceed the maximum hardness values specified, otherwise the welding procedure is to be considered as not having met the requirements.

2.13.6 Where there is insufficient material available in the welded test assembly to provide re-test specimens, subject to prior agreement with the Surveyor, a second assembly may be welded using the same conditions as the original test weld.

2.14 Test records

2.14.1 The procedure qualification record (PQR) is to be prepared by the manufacturer and is to include details of the welding conditions used in the test specified in 2.2 and the results of all the non-destructive examinations and destructive tests, including re-tests.

2.14.2 Provided that the PQR lists all the relevant variables and there are no inconsistent features and the results satisfy the requirements, the PQR may be endorsed by the Surveyor as satisfying the requirement of the Rules, *see also* 1.1.4.

2.15 Range of approval

2.15.1 A welding procedure qualification test that has successfully met the requirements may be used for a wider range of applications than those used during the test.

2.15.2 Changes outside of the ranges specified are to require a new welding procedure test.

2.15.3 Other ranges of approval from those specified in this Section may be agreed with the Surveyor, provided that they are in accordance with recognised National or International Standards.

2.15.4 Manufacturer. A welding procedure qualified by a manufacturer is valid for welding in workshops under the same technical and quality management.

2.15.5 Welding process and technique. The welding process and welding techniques approved are to be those employed during the welding procedure qualification test. Where multiple welding processes are used, these are to be employed in the same order as that used in the welding procedure qualification test. However, it may be acceptable to delete or add a welding process where it has been used solely to make the first weld run in the root of the joint, provided back gouging or grinding of the root weld is specified on the WPS. For multi-process procedures, the welding procedure approval may be carried out with separate welding procedure tests for each welding process.

2.15.6 Welding positions. Approval for a test made in any position is restricted to that position. To qualify a range of positions, test assemblies are to be welded for the highest heat input position, and the lowest heat input position, and all applicable tests are to be made on those assemblies. The above excludes welding in the vertical position with travel in the downward direction which will always require separate qualification testing and only be acceptable for that position.

2.15.7 Joint types. A qualification test performed on a butt weld may be considered acceptable for fillet and partial penetration welds, provided the same welding conditions are used. The range of approval depending on the type of joint for butt welds is given in Table 12.2.3.

Table 12.2.3 Range of approval for different types of butt joints

Type of welded joint for test assembly				Range of approval
Butt welding	One side	With backing Without backing	A B	A,C,D A,B,C,D
	Both sides	With gouging Without gouging	C D	C C,D

2.15.8 Range of material types:

- A qualification test performed on one strength level of steel may be used to weld all similar materials with the same or lower specified minimum yield stress with the exception of the two-run (T) or high welding heat input (A) techniques where acceptance is limited to the strength level used in the test. Similarly, a qualification test performed on a steel with one toughness level may be considered acceptable for welding all similar materials with the same or three toughness grades lower specified minimum toughness level.
- For high strength quenched and tempered steels, for each strength level, welding procedures are considered applicable to the same and lower toughness grades as that tested. For each toughness grade, welding procedures are considered applicable to the same and one lower strength level as that tested. The approval of quenched and tempered steels does not qualify thermo-mechanically rolled steels (TMCP steels) and vice versa.

Welding Qualifications

Chapter 12

Section 2

- (c) For weldable C and C-Mn steel forgings, welding procedures are applicable to the same and lower strength level as that tested. The approval of quenched and tempered steel forgings does not qualify other delivery conditions and vice versa.
- (d) For weldable C and C-Mn steel castings, welding procedures are applicable to the same and lower strength level as that tested. The approval of quenched and tempered steel castings does not qualify other delivery conditions and vice versa.
- Dissimilar materials. Where a qualification test has been performed using dissimilar materials, acceptance is to be limited to the materials used in the test.

2.15.9 Thickness and diameter range:

- (a) For straight butt welds, the material thickness range to be approved is to be based on the thickness of the test piece and the type of weld as shown in Table 12.2.4.
- (b) For butt welds between plates of unequal thickness, the lesser thickness is the ruling dimension.
- (c) For fillet welds and 'T' butt welds, Table 12.2.4 is to be applicable to both the abutting and through member thicknesses. In addition to the requirements of Table 12.2.4, the range of approval of throat thickness 'a' for fillet welds is to be as follows:
- single run: 0,75a to 1,5a
 - multi-run: as for butt welds with multi-run (i.e. $a = t$)
- (d) Notwithstanding any of the above, the approval of maximum thickness of base metal for any technique is to be restricted to the thickness of the test assembly if three of the hardness values in the heat affected zone are found to be within 25 Hv of the maximum permitted.
- (e) The material diameter range to be approved is to be based on the diameter of the test piece and type of weld as shown in Table 12.2.5.

Table 12.2.4 Welding procedure thickness approval range – Butt welds

Test thickness, see Note 1 (t in mm)	Range approved	
	All multi-run butt welds and all fillet welds see Notes 3 and 4	All single-run or two-run two-run (T technique) butt welds
$t \leq 3$	t to $2t$	0,7t to 1,1t
$3 < t \leq 12$	3 to $2t$	0,7t to 1,1t
$12 < t \leq 100$	0,5t to $2t$, see Note 2	0,7t to 1,1t see Note 5
$t > 100$	0,5t to 1,5t	0,7t to 1,1t see Note 5

NOTES

- Where the test plates have dissimilar thickness, the thickness, t , is to be based on the minimum thickness for butt welds and the maximum thickness for fillet welds.
- Subject to a maximum limit of 150 mm.
- For multi process procedures, the recorded thickness contribution of each process is to be used as a basis for the range of approval of the individual welding process.
- For vertical down welding, the test piece thickness, t , is the upper limit of the range of application.
- For processes with heat input over 5,0 kJ/mm, the upper limit of the range of approval is to be 1,0 t .

Table 12.2.5 Diameter range approved

Diameter used for test, see Note 1	Range of diameters approved
$D \leq 25$ mm	0,5D to 2D
$D > 25$ mm	$> 0,5D$, see Note 2

NOTES

- D is the outside diameter of the pipe or the smallest side dimension of rectangular hollow section.
- Lower diameter range limited to 25Ø mm minimum.

2.15.10 Welding consumables:

- (a) For manual and semi-automatic welding used for the fill and capping weld runs, it may be acceptable to change the brand or trade name of the welding electrode or wire from that used in the test, provided the proposed alternative has the same or higher approval grading and the same flux type (e.g. basic low hydrogen, rutile, etc.) as used in that test.
- (b) For the consumable used to make the root weld of full penetration butt welds made from one side only, no change in the type or trade name of the consumable or backing material is permitted.
- (c) For processes with heat input over 5 kJ/mm, no change in the type or trade name of the consumable is permitted.

2.15.11 Shielding gas. For gas shielded welding processes, a change in shielding gas composition from that used in the test will require a new qualification test.

2.15.12 Heat Input. The upper limit of heat input approved is 25 per cent greater than that used in the test, or 5,5 kJ/mm, whichever is the smaller. With heat input over 5,0 KJ/mm, the upper limit is 10 per cent above that used in the test. In all cases, the lower limit of heat input approved is 25 per cent lower than that used in the test.

2.15.13 Current type. The current type used during the qualification test is to be the only type approved. Additionally, changes from or to pulsed current require new qualification tests.

2.15.14 Preheat temperature. The temperature used during the test is to be the minimum approved. Higher temperatures may be specified for production welds up to the maximum interpass temperature. Where hardness tests have been performed that exhibit results near the maximum permitted, an increase in preheat temperature is required when welding material of greater thickness than that used in the test.

2.15.15 Interpass temperature. The maximum interpass temperature recorded during qualification testing is to be the maximum approved. Lower temperatures may be specified for production welding, but no lower than the minimum preheat temperature.

Welding Qualifications

Chapter 12

Sections 2 & 3

2.15.16 Post-weld heat treatment. A qualification test performed with no post weld heat treatment is only acceptable for production welding where no heat treatment is applied. Where the qualification test has included a post weld heat treatment, this is to be applied to all welds made with the welding procedure. The average specified soak temperature may vary by up to 25°C from that tested.

2.15.17 Shop primers. Welding procedure qualification with shop primers qualifies welds without primer, but not vice versa.

2.16 Welding procedure specification (WPS)

2.16.1 A welding procedure specification (WPS) is to be prepared by the manufacturer detailing the welding conditions and techniques to be employed for production welding. The WPS is to be based on the conditions and variables used during the qualification test, and is to include all the ranges of the essential variables specified in 2.2.1 and 2.15.

2.16.2 The WPS should reference the procedure qualification record upon which it is based and is to be approved by the Surveyor prior to commencing production welding.

Section 3 Specific requirements for stainless steels

3.1 Scope

3.1.1 The requirements of this Section relate to the group of steel materials classed as stainless steels and include austenitic and duplex grades and martensitic grades.

3.1.2 In all cases, welding procedure tests are to be performed generally in accordance with Section 2 with the specific requirements specified below.

3.2 Austenitic stainless steels

3.2.1 The requirements of this Section relate to the group of stainless steel materials that are austenitic at ambient and sub-zero temperatures, (e.g. 304L, 316L types), see Table 3.7.1 in Chapter 3.

3.2.2 Impact tests are to be performed from specimens removed from the weld metal. Tests in the heat affected zone are not required.

3.2.3 Hardness tests are generally not required.

3.2.4 For cryogenic or corrosion resistant applications, the ferrite content in the weld cap region is to be measured and is to be in the range 2 to 10 per cent, with the exception of grades S 31245 and N 08904 where the content is to be nominally zero.

3.2.5 A qualification test performed on an austenitic grade may be considered acceptable for welding other austenitic steels with the same or lower level of alloying elements and the same or lower tensile strength.

3.2.6 A qualification test performed for cryogenic applications may be considered acceptable for chemical applications, but not vice versa.

3.3 Duplex stainless steels

3.3.1 The requirements of this Section relate to the group of stainless steel materials that have a ferritic-austenitic structure and are usually referred to as duplex or super duplex stainless steels (e.g. S 31803, S 32760).

3.3.2 Impact test specimens are to be removed from the weld and heat affected zone in accordance with Section 2 with the exception that impact test specimens notched at the FL + 10 mm location are not required. The specimens are to be tested at a temperature of -20°C or the minimum design temperature whichever is the lower and exhibit a minimum average energy of 40 J.

3.3.3 The corrosion resistance is to be maintained in the welded condition and the following tests are to be performed to demonstrate acceptable resistance, unless agreed otherwise.

- (a) A sample is to be removed from the weld and heat affected zone for micro-structural examination and is to be suitably prepared and etched so that the micro-structures of the weld and heat affected zones can be examined at a magnification of x200 or higher. The micro-structure of the weld and heat affected zone is to be examined, the percentage grain boundary carbides and intermetallic precipitates is to be reported.
- (b) The ferrite content in the un-reheated weld cap and cap HAZ along with the weld root and root HAZ are to be measured and reported. The ferrite content is to be in accordance with Table 12.3.1. Where the intended construction is such that the corrosion medium is only in contact with one surface of the weld (i.e. the weld root), the ferrite determination need only be reported in that surface area.
- (c) Corrosion testing is to be performed on samples removed from the weld such that both the weld and HAZ are included in the test. The critical pitting temperature is to be determined in accordance with ASTM G48 Method C and meet the requirements specified in Table 12.3.1. The cap and root surfaces are to be inspected for evidence of pitting and may require probing the surface with a needle. Pitting found on the ends of the specimen in the weld cross-section may be ignored. The use of the weight loss method for corrosion testing may be accepted subject to special consideration.

3.3.4 Where the test weld is between a grade of carbon steel and duplex stainless steel, the test requirements of 3.3.3(a) and (c) are not required and the ferrite content of the weld and the duplex heat affected zone are to be reported for information.

Welding Qualifications

Chapter 12

Sections 3 & 4

Table 12.3.1 Requirements for ferrite content and corrosion tests for duplex stainless steel test welds

Duplex Stainless Steel Material Grade	Weld and HAZ Ferrite content	Minimum Critical Pitting Temperature (CPT)
S 31260	30 to 70%	20°C
S 31803	30 to 70%	20°C
S 32550	35 to 65%	25°C
S 32750	35 to 65%	25°C
S 32760	35 to 65%	25°C

3.3.5 A qualification test performed on a duplex stainless steel grade may be considered acceptable for welding other duplex grades which have the same or less stringent mechanical or corrosion properties.

3.3.6 The range of heat input is not to vary by more than +10 per cent or -25 per cent from that used during testing.

3.4 Martensitic stainless steels

3.4.1 The requirements of this Section relate to the group of stainless steel materials that have a martensitic structure at ambient temperatures, see Table 4.5.1 in Chapter 4.

3.4.2 The results of the hardness survey results are to be reported for information purposes only.

3.4.3 A qualification test is considered acceptable only for the grade of material used in the test.

Section 4 Welding procedure tests for non-ferrous alloys

4.1 Requirements for aluminium alloys

4.1.1 The requirements for welding procedure qualification tests for aluminium alloys are to be in accordance with the general requirements of Section 2 with the following exceptions and specific requirements.

4.1.2 Non-destructive examination is to be performed in accordance with 2.5 and the assessment of results is to be in accordance with Table 12.4.1.

4.1.3 Acceptance of the mechanical tests is to be in accordance with Ch 11.9. Welding of the strain hardened and heat treatable aluminium alloys will generally result in a loss of tensile strength in the heat affected zone below that specified for the base materials and the tensile strength acceptance criteria to be applied is that specified for the material in the annealed or "as fabricated" condition. Minimum values of tensile strength measured on the transverse tensile samples are given in Table 12.4.2.

4.1.4 Impact tests and hardness surveys are not required for aluminium alloys.

4.1.5 Four side bend tests may be used in place of root and face bends where the test thickness exceeds 12 mm, and longitudinal bend tests may be used instead of transverse tests where the test weld is between different grades of alloy. Bend specimens are to be bent round a former in accordance with Table 11.9.1 in Chapter 11, with the exception that the 6000 series alloys may be bent round a former with $D/t = 7$.

4.1.6 The ranges of approval to be applied to the WPS are to be as specified for steel in 2.15 with the following exceptions:

- The welding positions approved are as detailed in Table 12.4.3.
- The aluminium alloys are grouped into three groups as follows:
 - Group A: aluminium-magnesium alloys, with Mg content $\leq 3,5$ per cent (alloy 5754).
 - Group B: aluminium-magnesium alloys with 4 per cent $\leq \text{Mg} \leq 5,6$ per cent (alloys 5059, 5083, 5086, 5383 and 5456).
 - Group C: aluminium-magnesium-silicon alloys (alloys 6005A, 6061 and 6082).

For each group, the qualification made on one alloy qualifies the procedure also for the other alloys in the group, with equal or lower tensile strength after welding. The qualification made on group B alloys qualifies the procedure for Group A alloys also. Approval for the range of material grades is summarised in Table 12.4.4.

- The qualification of a procedure carried out on a test assembly of thickness t is valid for the thickness range given in Table 12.4.5. In the case of butt joints between dissimilar thicknesses, t is the thickness of the thinner material. In the case of fillet joints between dissimilar thicknesses, t is the thickness of the thicker material. In addition to the requirements of Table 12.4.5, the range of the qualification of throat thickness of fillet welds, a , is given in Table 12.4.6. Where a fillet weld is qualified by a butt weld test, the throat thickness range qualified is to be based on the thickness of the deposited weld metal.
- The range of shielding gas compositions approved is to be in accordance with Table 11.9.2 in Chapter 11.
- A change in the brand or trade name of the filler metal from that used in the test is acceptable, provided that the proposed consumable has the same or higher strength grading.
- A change in post-weld heat treatment or ageing is not permitted, except that for the heat treatable alloys, artificial ageing may give approval for prolonged natural ageing.

Welding Qualifications

Chapter 12

Section 4

Table 12.4.1 Non-destructive examination acceptance limits for aluminium alloys

Imperfection	Acceptance limits for aluminium alloys
Surface Profile Undercut Excess penetration and concavity Weld reinforcement height Asymmetry of fillet welds Shrinkage groove or root concavity Overlap Reinforcement shape	Slight intermittent, provided depth does not exceed 0,5 mm 4,0 mm max. 7,0 mm max. Maximum difference between leg lengths = 20% of throat + 2 mm Slight intermittent provided that it does not exceed 1,0 mm Not permitted The weld reinforcement is to blend smoothly with the parent material
Misalignment	$t/10$ but not greater than 2,5 mm
Cracking and lamellar tears	Not permitted
Lack of root fusion Lack of side-wall fusion Lack of inter-run fusion Lack of penetration	Not permitted Not permitted Not permitted Not permitted
Porosity Individual pores Uniformly distributed	d not greater than $t/4$ 2,0 mm max. For t up to 6 mm $d = 0,4$ mm max. For t over 6 mm $d = 0,8$ mm max. pores between $0,8 < d < 1,6$ limited to $t/2$ in number per 100 mm ² of weld area
Solid inclusions Slag inclusions - linear see Note 1 Oxide inclusions - linear Slag inclusions - individual Metallic inclusions	Not permitted Widely scattered and each not exceeding 1,5 max. Not permitted Tungsten – 0,8 mm max. Copper – not permitted
where t = material thickness d = diameter of circular shaped imperfection	
NOTES 1. Linear inclusions parallel to the weld may indicate lack of fusion or penetration and may require further investigation. 2. A planar defect is considered to have only two dimensions, i.e. no thickness. For example, cracks or lack of fusion. 3. A volumetric defect is one that is considered to have three dimensions, e.g. inclusions, porosity, etc.	

Table 12.4.2 Tensile strength requirements by grade for aluminium alloys

Parent material Grade (alloy designation)	Minimum tensile strength (N/mm ²)
5754	190
5086	240
5083	275
5383	290
5059	330
5456	290
6005A	170
6061	170
6082	170

Table 12.4.3 Welding procedure approval, welding positions for aluminium alloys

Test position		Positions approved
Downhand	D	D
Horizontal-vertical	X	D, X, Vu
Vertical up	Vu	D, X, Vu
Overhead	O	D, X, Vu and O
NOTE Welding in vertical down (Vd) position is not recommended.		

Welding Qualifications

Chapter 12

Table 12.4.4 Welding procedure approval, aluminium material grades approved

Material used in qualification test	Material Grades approved				
5754	5754				
5086	5086	5754			
5083	5083	5086	5754		
5383	5383	5083	5086	5754	
5059	5059	5383	5083	5086	5754
5456	5456	5383	5083	5086	5754
6005A	6005A	6082	6061		
6082	6005A	6082	6061		
6061	6005A	6082	6061		

NOTE
Approval includes all the different strained and tempered conditions in each case.

Table 12.4.5 Range of qualification for parent material thickness

Thickness of test assembly, t (mm)	Range of qualification Multi pass welds	Range of qualification All single-run or two-run (T technique) butt welds
$t \leq 3$	0,5 to $2t$	0,5 t to 1,1 t
$3 < t \leq 20$	3 to $2t$	0,5 t to 1,1 t
$t > 20$	$\geq 0,8t$	0,5 t to 1,1 t

Table 12.4.6 Range of qualification of throat thickness for fillet welds

Throat thickness of test piece, a (mm)	Range of qualification
$a < 10$	0,75 a to 1,5 a
$a \geq 10$	≥ 7.5

Table 12.4.7 Minimum transverse tensile strengths for welded copper alloy propellers

Alloy designation	Minimum tensile strength (N/mm ²)
CU 1	370
CU 2	410
CU 3	500
CU 4	550

4.2 Requirements for copper alloys

4.2.1 The requirements for welding procedure qualification tests for copper alloys are to be in accordance with the requirements for steel as given in Section 2 with the following exceptions and additions.

4.2.2 Impact tests on copper alloys are not required.

4.2.3 Hardness tests are not required for seawater service.

4.2.4 For the welding of cast copper alloys for propellers, the minimum tensile strength from the transverse tensile test is to be in accordance with Table 12.4.7.

4.2.5 Bend tests are to be performed over a diameter of former as detailed in Table 12.4.8.

4.2.6 The range of approval to be applied to the WPS is to be as specified in 2.15 with the exception of the material grades which are detailed in Table 12.4.9.

Welding Qualifications

Table 12.4.8 Former diameters for bend testing of copper alloy welds

Alloy designation (see Chapter 9)	Former diameter (D/t)
Cast propellers: CU1 CU2 CU3 CU4	4 4 6, see Note 6, see Note
Other short freezing range castings: Copper-Nickel 90/10 Copper-Nickel 70/30 Aluminium bronze	4 4 6
Wrought alloys (tubes and pipes): Copper-phosphorus Aluminium-brass 90/10 Copper-nickel-iron 70/30 Copper-nickel-iron	3 3 3 3
NOTE Where the qualification tests for these alloys are subjected to post-weld heat treatment the former diameter may be increased to $D/t = 10$.	

Table 12.4.9 Range of approval for copper alloy material grades

Category	Alloy grade used in the qualification test	Alloy grades approved
Propellers	CU1 CU2 CU3 CU4	CU1 CU1 and CU2 CU1, CU2 and CU3 CU4 see Note 1
Tubes/pipes	90/10 Copper -Nickel-Iron	90/10 Copper -Nickel-Iron
	70/30 Copper -Nickel-Iron	70/30 Copper -Nickel-Iron and 90/10 Copper -Nickel-Iron
Tubes/pipes see Note 2	Copper-Phosphorus-non arsenical Copper-Phosphorus-non arsenical Aluminium-brass	Copper-Phosphorus-non arsenical Copper-Phosphorus-non arsenical Aluminium-brass
NOTES 1. Where a CU3 type welding consumable has been used for the qualification test, the range of approval may also include welding of CU3. 2. These grades have limited weldability and approval to weld is subject to the materials satisfying the requirements of Table 9.3.1 in Chapter 9.		

Section 5 Welder qualification tests

5.1 Scope

5.1.1 The requirements of this Section relate to qualification of welders involved in welded construction associated with ships, or other marine structures, and products or components intended for use on or in these structures.

5.1.2 The requirements relate to fusion welding processes that are designated as manual, semi-automatic or partly mechanised. Special consideration will be given to other welding processes adapted from these requirements.

5.1.3 Prior to commencing production welding, the welder is to have performed a qualification test that satisfies these requirements. It is the responsibility of the manufacturer to ensure that the welder possesses the required level of skill for the work to be undertaken.

5.1.4 The qualification of welders is to be documented by the manufacturer and the records are to be available for review by the Surveyor.

5.1.5 Welder qualification tests made in accordance with EN, ISO, JIS, ASME or AWS may be considered for acceptance provided that, as a minimum, they are equivalent to, and meet the technical intent of these Rules to the satisfaction of the Surveyor.

Welding Qualifications

Chapter 12

Section 5

5.2 Welder qualification test assemblies

5.2.1 The welding of the welder qualification test assembly is to simulate, as far as practicable, the conditions to be experienced in production and be witnessed by the Surveyor. The test is to be carried out on a test assembly piece and not by way of production welding.

5.2.2 The test is to simulate, as far as practicable, the welding techniques and practices to be encountered during production welding. The test assembly is to be designed to test the skill of the welder and have the shape and dimensions appropriate to the range of approval required.

5.2.3 The inspection length of the test weld is to be such as to permit the removal of all the necessary test specimens and for plate tests, but in no case is to be less than 250 mm. The test assembly is to be set in one of the positions as shown in Fig. 12.2.2 appropriate to the welding positions to be approved.

5.2.4 A welding procedure specification (WPS) is required for the execution of the qualification test and is to include the information specified in 2.2.1, as a minimum.

5.2.5 The test assembly is to be marked with a unique identification and the inspection length is to be identified prior to commencing welding. For pipe welds, the whole circumference is to be considered as the inspection length.

5.2.6 During welding of the test assembly, the welding time is to be similar to that expected under production conditions. For manual or semi-automatic processes, at least one stop and re-start in the root and in the top surface layer is to be included in the inspection length and marked for future inspection.

5.2.7 During welding of the test assembly, minor imperfections may be removed by the welder by any method that is used in production, except on the surface layer.

5.2.8 The Surveyor may stop the test if the welding conditions are not correct or if there is any doubt about the competence of the welder to achieve the required standard.

5.3 Examination and testing

5.3.1 Each completed test weld is to be examined and tested in accordance with the requirements of Table 12.5.1.

5.3.2 Visual examination is to be performed in the as welded state prior to any other assessment.

5.3.3 For plate butt welds, fracture testing may be used in place of radiography.

5.3.4 Where a backing strip has been used, it is to be retained for non-destructive examinations, but is to be removed prior to performing any bend or fracture tests.

5.3.5 Where fracture tests are required, they are to sample as much of the inspection length as practicable and the test assembly may be cut into several test specimens to achieve this. Testing is to be performed as shown in Figs. 12.5.1(a) or 12.5.1(b).

5.3.6 For butt weld tests in aluminium alloys both radiography and bend tests are required.

5.3.7 When bend tests are required, 2 root and 2 face bends are to be tested and where the test thickness exceeds 12 mm, these may be substituted by 4 side bends specimens. The diameter of former to be used is to be in accordance with that specified for welding procedure qualification testing given in 2.7.6(a).

5.3.8 Where macro examination is required, the specimen is to be polished and etched to reveal the weld runs and heat affected zones, and be examined at a magnification between x5 and x10.

Table 12.5.1 Welder qualification test requirements

Examination type	Butt welds	Fillet welds	Pipe branch welds
Visual	100%	100%	100%
Surface crack detection	See Note 1	100%	100%
Radiography	100% See Notes 2 and 6	Not required	Not required
Bend tests	4 required See Notes 3 and 6	Not required	Not required
Fracture tests	Not required	1 required See Note 4	Not required
Macro	Not required	1 required See Note 4	4 required See Note 5

NOTES

1. Surface crack detection examination may be required by the Surveyor in order to clarify the acceptability of any weld feature.
2. Radiography may be replaced by ultrasonic examination for carbon and low alloy steels where the thickness exceeds 12 mm.
3. Bend tests are required for gas metal arc welding with solid wire (GMAW) and oxy-acetylene welding.
4. The fracture test may be replaced with 4 macro sections equally spaced along the inspection length.
5. Macro-sections are to be separated by 90° measured around the abutting pipe member.
6. Radiography and bend tests are required for tests in aluminium alloys.

Chapter 12

Section 5

5.4 Acceptance criteria

5.4.1 The acceptance criteria are to be in accordance with 2.5.5.

5.4.2 Fracture tests and macro-sections are to be assessed in accordance with the non-destructive examination acceptance criteria.

5.4.3 Bend tests are considered acceptable if after bending through an angle of at least 180°, there are no defects on the tension side of the specimen greater than 3 mm in any direction.

5.5 Failure to meet requirements

5.5.1 Where a macro-section fails to meet requirements, one additional specimen may be removed from the test assembly and examined.

5.5.2 Where a bend or fracture test specimen fails to meet requirements, two additional specimens may be prepared from the same test assembly. If there is insufficient material, the welder may be permitted to weld an additional assembly to the same WPS, at the discretion of the Surveyor.

5.5.3 Where any of the additional test specimens fails to satisfy the requirements, the test will be considered as not meeting the requirements.

5.5.4 Where a test fails to comply with the acceptance criteria, the welder may be permitted to weld a second test piece. If this does not meet requirements, the welder is to be considered as not being capable of achieving the requirements.

5.6 Range of approval

5.6.1 Upon successful completion of all the necessary examinations and tests, the welder is to be considered qualified. The essential variables and the range of welding conditions for which the welder is considered approved are specified in the following paragraphs.

5.6.2 Welding variables such as preheat, interpass temperature, heat input and current type are not considered welder qualification variables. However, if the WPS used for testing specify these, they are to be included in the test and the welder is expected to follow the specific instructions.

5.6.3 Where the WPS used for the welder qualification test specifies post weld heat treatment, this need not be applied to the test weld unless bend tests are required and the material exhibits low ductility in the as welded condition.

5.6.4 The qualification test performed by a manufacturer is only applicable to workshops under the same technical control and quality system as that used for the test.

5.6.5 The welding process used in the qualification test is the process approved. However, it is possible for the welder to use more than one process in the test and the range of approval that may be applied to each will be within the limits of the essential variables appropriate to the part of the test where each welding process was used.

5.6.6 Material types are to be grouped as shown in Table 12.5.2 for welder qualifications. A qualification test performed on one material from a group will permit welding of all other materials within the same group. In addition, qualification on one group of materials may confer approval to weld other groups as shown in Table 12.5.3.

5.6.7 A qualification test performed on one thickness will confer approval to weld other thicknesses as specified in Table 12.5.4. Where welding is required between materials of different thickness, the reference thickness for approval purposes is to be the lesser thickness.

5.6.8 A qualification test performed using a specific diameter of pipe will give approval to weld other diameters as shown in Table 12.5.5. For branch welds, the diameter upon which approval is based is to be the branch member.

5.6.9 A qualification test performed on a butt weld may be considered as giving approval for fillet welds.

5.6.10 A butt qualification test welded from one side, with the root unsupported (i.e. no backing), will give approval for welds made from both sides with or without back gouging or grinding, but not vice versa.

5.6.11 A qualification test performed in one position will give approval to weld in other positions as shown in Table 12.5.6.

5.6.12 For manual metal arc welding with covered electrodes, a qualification test performed using an electrode with one type of coating will only be approved for welding with that type of coating. However, a qualification test performed using a basic low hydrogen type coating will confer approval to use electrodes with rutile coatings.

5.6.13 For gas shielded welding processes that use a single component shielding gas, no change to the gas composition is permitted from that tested. Where the test has used a two component shielding gas, a change in the ratio of component gases is permitted, provided that one of the components is not reduced to zero. Where the test has used a three component shielding gas, changes are permitted in the ratio of component gases and the gas with the smallest ratio may be reduced to zero, provided this does not change the shielding gas from an active one to an inert one or vice versa. In addition, where a change in shielding gas composition requires a different welding method or technique to be employed, a new qualification test will be required.

5.6.14 A change of welding flux from that used for the test is permitted.

WQ 35	Copper alloys for tubes – Aluminium brass	Aluminium brass	Ch 9,3
WQ 36	Copper alloys for tubes – Copper-nickel-iron	70/30 Cu/Ni and 90/10 Cu/Ni	Ch 9,3

5.7 Welders qualification certification

5.7.1 All the relevant conditions used during the test are to be entered on the welder's qualification certificate along with the permitted range of approval.

5.7.2 If the Surveyor is satisfied that the welder has demonstrated the appropriate level of skill and all tests are satisfactory, the Surveyor will endorse the certificate verifying that the details contained on it are correct and that the test welds were prepared, welded and tested in accordance with the specified Rules, Codes or Standards.

5.7.3 The welder is considered to be approved for an initial validity period of 2 years. The welder is considered to have retained the qualification subject to the manufacturer confirming every 6 months that the welder has used the welding process with acceptable performance in the preceding 6 months.

5.7.4 After 2 years, the Surveyor may extend the validity of the approval for another period of two years provided that records or documented evidence is made available confirming acceptable welding performance, within the original range of approval, without a break exceeding 6 months. The Surveyor will signify acceptance of the extension to the validity by endorsing the certificate.

	D + Vd + O, see Note 3	—	Vd	D—	Vd

NOTES

1. Pipe rotate.
2. Vd position not usually recommended for pipe welds less than 500 mm diameter.
3. Pipe fixed with axis in the horizontal position (e.g. ASME 5G).
4. Pipe fixed with axis at 45° to the horizontal (e.g. ASME 6G).
5. Plate qualification tests may be considered acceptable for pipes with diameter over 500 mm.

Welding Qualifications

Chapter 12

Section 5

5.7.5 Where there is any reason to question the welder's ability, or there is a lack of continuity in the use of the welding process, or insufficient recorded evidence of acceptable weld performance, the welder is to perform a new qualification test.

5.7.6 Where the manufacturer has existing welders that have previously performed qualification tests, these may be considered for acceptance provided they satisfy the above requirements and the tests have been performed in the presence of an independent examiner that is acceptable to the Society.

5.7.7 Notwithstanding the above, the Surveyor may at any time request a review of a welder's qualification records. If there is any reason for doubt concerning the skill of the welder, the Surveyor may withdraw the qualification and require a re-qualification test to be performed.

Requirements for Welded Construction

Chapter 13

Section 1

Section

- 1 **General welding requirements**
- 2 **Specific requirements for ship hull structure and machinery**
- 3 **Specific requirements for fabricated steel sections**
- 4 **Specific requirements for fusion welded pressure vessels**
- 5 **Specific requirements for pressure pipework**
- 6 **Repair of existing ships by welding**
- 7 **Austenitic and duplex stainless steel – Specific requirements**

■ Section 1 General welding requirements

1.1 Scope

1.1.1 This Chapter specifies requirements for fabrication and welding during construction and repair of ships or other marine structures, and their associated pressure vessels, machinery, equipment, components and products intended for use in these structures.

1.1.2 The requirements relate to fusion welding. Special consideration will be given to the use of other welding processes based on these requirements.

1.1.3 It is the responsibility of the manufacturer to ensure compliance with all aspects of these Rules and inform the Surveyor of any deviations that have occurred. All deviations are to be recorded as non-compliances along with the corrective actions taken and failure to do this is considered to render the fabrication to be in non-compliance with the Rules.

1.1.4 Welded constructions that comply with National or International specifications may be accepted to the satisfaction of the surveyor, provided that these specifications give reasonable equivalence to the requirements of this Chapter.

1.1.5 All welded construction is to be to the satisfaction of the Surveyor.

1.2 Design

1.2.1 Prior to commencing any work, the component to be manufactured is to be subjected to design review and approval in accordance with the Rule requirements.

1.2.2 The material characteristics that are affected by welding, particularly the loss of strength (e.g. in precipitation or strain hardened aluminium alloys) are to be considered in the design. The weld joints in such materials are to be arranged such that they are in areas of lower stress.

1.3 Materials

1.3.1 Materials used in welded construction are to be manufactured at works approved by LR. The use of materials from alternative sources will be subject to agreement of the Surveyor and satisfactory verification testing.

1.3.2 Materials are to be supplied and certified in accordance with the requirements of Chapters 1 to 10 of these Rules.

1.3.3 Materials used in welded construction are to be readily weldable and are to have proven weldability, unless requirements are agreed with LR in advance.

1.3.4 Where the construction details are such that materials are subject to through-thickness strains, consideration is to be given to using material with specified through-thickness properties as specified in Ch 3,8.

1.3.5 When ordering materials for construction, consideration is to be taken of the possible degradation of properties during fabrication or post-weld heat treatment. Where these materials are used, consideration is to be given to additional test requirements being specified to the supplier.

1.3.6 The identity of materials is to be established by way of markings etc, during fabrication, so that traceability to the original manufacturer's certificate is maintained.

1.3.7 Pre-fabrication shop primers may be applied prior to welding, provided that they are of an approved type and have been tested to demonstrate that they have no deleterious effects on the completed weld.

1.3.8 Where it is proposed to weld forgings and/or castings, full details of the joint details, welding procedures and post-weld heat treatments are to be submitted for consideration.

1.4 Requirements for manufacture and workmanship

1.4.1 The welding workshops are to be assessed by the Surveyor for their capability to produce work of the required quality in accordance with the requirements specified for the type of construction, see Sections 2 to 5.

1.4.2 Where structural components are to be assembled and welded in works sub-contracted by the builder, the Surveyor is to inspect the sub-contractor's works to ensure that compliance with the requirements of this Chapter is achieved.

Requirements for Welded Construction

Chapter 13

Section 1

1.4.3 The manufacturer is to provide a system of regular supervision of all welding, by suitably qualified and experienced personnel.

1.4.4 Welding is to be performed in covered workshops as far as practicable. Where this is not possible, provision is to be made in the welding area to give adequate protection from wind, rain and cold, etc.

1.4.5 Where required, arrangements are to be such as to permit adequate ventilation and access for preheating, and for the satisfactory completion of all welding operations.

1.4.6 The location of welding connections and sequences of welding are to be arranged to minimise distortion and the build up of residual stresses. Welded joints are to be so arranged as to facilitate the use of downhand welding wherever possible.

1.4.7 In the case of repairs to existing structures or components, care is to be exercised when attaching fit-up aids by welding to ensure that the base materials in way of the attachments are of weldable quality.

1.4.8 In order to prevent cross contamination of different material types, the welding of carbon steel materials is to be in areas segregated from that used for either austenitic or non-ferrous materials, see Section 7.

1.5 Cutting of materials

1.5.1 Materials may be cut to the required dimensions by thermal means, shearing or machining in accordance with the manufacturing drawings or specifications.

1.5.2 Cold shearing is not to be used on materials in excess of 25 mm thick. Where used, the cut edges that are to remain un-welded are to be cut back by machining or grinding for a minimum distance of 3 mm.

1.5.3 Material, which has been thermally cut, is to be free from excessive oxides, scale and notches.

1.5.4 All cut edges are to be examined to ensure freedom from material and/or cutting defects. Visual examination may be supplemented by other techniques.

1.5.5 Thermal cutting of alloy and high carbon steels may require the application of preheat, and special examination of these cut edges will be required to ensure no cracking. In these cases, the cut edge is to be machined or ground back a distance of at least 2 mm, unless it has been demonstrated that the cutting process has not damaged the material.

1.5.6 Any material damaged in the process of cutting is to be removed by machining, grinding or chipping back to sound metal. Weld repair may only be performed with the agreement of the Surveyor.

1.6 Forming and bending

1.6.1 Plates, pipes, etc., may be formed to the required shape by any process which does not impair the quality of the material.

1.6.2 Where hot forming is employed or during cold forming where the material is subjected to a permanent strain exceeding 10 per cent or formed to a diameter to thickness ratio less than 10, tests are required to be performed to demonstrate that the material properties remain acceptable.

1.6.3 As far as practicable, forming is to be performed by the application of steady continuous loading using a machine designed for that purpose. The use of hammering, in either the hot or cold condition is not to be employed.

1.6.4 Material may be welded prior to forming or bending, provided that it can be demonstrated that the weld mechanical properties are not impaired by the forming operation. All welds subjected to bending are to be inspected on completion to ensure freedom from surface breaking defects.

1.7 Assembly and preparation for welding

1.7.1 Excessive force is not to be used in fairing and closing the work. Where excessive root gaps exist between surfaces or edges to be joined, corrective measures are to be adopted.

1.7.2 Provision is to be made for retaining correct alignment during welding operations in accordance with the approved manufacturing specifications and welding procedures.

1.7.3 Tack welds are to be avoided as far as practicable. When used, tack welds are to be of the same quality as the finished welds, made in accordance with approved welding procedures, and where they are to be retained as part of the finished weld, they are to be clean and free from defects.

1.7.4 Generally, tack welds are not to be applied in lengths of less than 30 mm for mild steel grades and aluminium alloys, and 50 mm for higher tensile steel grades. Smaller tack welds may be accepted for steels, provided that the carbon equivalent of the materials being welded is not greater than 0.36 per cent.

1.7.5 Where deep penetration welding is used (see 2.4.6), welding procedure tests are to demonstrate that the specified degree of penetration is achieved in way of tack welds left in place.

1.7.6 Where temporary bridge pieces or strong-backs are used, they are to be of similar materials to the base materials and welded in accordance with approved welding procedures.

1.7.7 Any fit-up aids and tack welds, where welded to clad materials, are to be attached to the base material and not to the cladding.

Requirements for Welded Construction

Chapter 13

Section 1

1.7.8 Surfaces of all parts to be welded, are to be clean, dry and free from rust, grease, debris and other forms of contamination.

1.7.9 When misalignment of structural members either side of bulkheads, decks etc., exceeds the agreed tolerance, the misaligned item is to be released, realigned and re-welded in accordance with an approved procedure.

1.8 Welding equipment and welding consumables

1.8.1 Welding plant and equipment is to be suitable for the purpose intended and properly maintained, taking into account relevant safety precautions.

1.8.2 Suitable means of measuring the welding parameters (i.e. current, voltage and travel speed) are to be available. Electrical meters are to be properly maintained and have current calibrations.

1.8.3 Welding consumables are to be suitable for the type of joint and grade of material to be welded, and in general, are to be LR Approved in accordance with Chapter 11.

1.8.4 Special care is to be taken in the distribution, storage and handling of all welding consumables. They are to be kept in heated dry storage areas with a relatively uniform temperature in accordance with the consumable manufacturer's recommendations. Condensation on the metal surface (e.g. wire electrodes and studs) during storage and use is to be avoided.

1.8.5 Prior to use, welding consumables are to be dried and/or baked in accordance with the consumable manufacturer's recommendations.

1.8.6 Satisfactory storage and handling facilities for consumables are to be provided close to working areas and the condition of welding consumables are to be subject to regular inspections.

1.9 Welding procedure and welder qualifications

1.9.1 Welding procedures are to be developed by the manufacturer for all welding, include weld repairs, and are to be capable of achieving the mechanical property requirements and non-destructive examination quality appropriate to the work being undertaken.

1.9.2 Welding procedures are to be established for the welding of all joints and are to be qualified by testing in accordance with Chapter 12. The welding procedures are to give details of the welding process, type of consumable, joint preparation, welding position and filler metals to be used.

1.9.3 The proposed welding procedures are to be approved by the Surveyor prior to construction.

1.9.4 All welders and welding operators are to be qualified in accordance with the requirements of Chapter 12. Qualification records to demonstrate that welding personnel have the skills to achieve the required standard of workmanship are to be available to the Surveyor.

1.10 Welding during construction

1.10.1 Materials to be assembled for welding are to be retained in position by suitable means such that the root gaps and alignment are in accordance with the approved manufacturing specifications and welding procedures.

1.10.2 Surfaces of all parts to be welded, are to be clean, dry and reasonably free from rust, scale and grease.

1.10.3 Pre-heat is to be applied, as specified in the approved welding procedure, for a distance of at least 75 mm from the joint preparation edges. The method of application and temperature control are to be such as to maintain the required level throughout the welding operation.

1.10.4 When the ambient temperature is 0°C or less, or where moisture resides on the surfaces to be welded, due care is to be taken to pre-heat the joint to a minimum of 20°C, unless a higher pre-heat temperature is specified.

1.10.5 Where tack welds are to be removed from the root of the weld joint, this is to be carried out such that the surrounding material and joint preparation is not damaged.

1.10.6 The welding arc is to be struck on the parent metal which forms part of the weld joint or on previously deposited weld metal.

1.10.7 Where the welding process used is slag forming (e.g. manual metal arc, submerged arc, etc.) each run of deposit is to be cleaned and free from slag before the next run is applied.

1.10.8 Full penetration welds are to be made from both sides of the joint as far as practicable. Prior to welding the second side, the weld root is to be cleaned, in accordance with the requirements of the approved welding procedure, to ensure freedom from defects. When air-arc gouging is used, care is to be taken to ensure that the ensuing groove is slag and oxide free and has a profile suitable for welding.

1.10.9 Where welding from one side only, care is to be exercised to ensure the root gap is in accordance with the approved welding procedure and the root is properly fused.

1.10.10 Particular care is to be exercised in welding in the vertical position with direction of travel downward (Vd) to avoid welding defects. The use of solid wire gas metal arc (GMAW) process in the vertical down position is to be avoided.

1.10.11 Welding is to proceed systematically with each welded joint being completed in correct sequence without undue interruption.

Requirements for Welded Construction

Chapter 13

Section 1

1.10.12 After welding has been stopped for any reason, care is to be taken in restarting to ensure that the previously deposited weld metal is thoroughly cleaned of slag and debris, and preheat has been re-established.

1.10.13 Care is to be taken to avoid stress concentrations such as sharp corners or abrupt changes of section, and completed welds are to have an even contour, blending smoothly with the base materials. The weld shape and size is to be in accordance with that specified in the approved drawings or specifications.

1.10.14 Welded temporary attachments used to aid construction are to be removed carefully by grinding, cutting or chipping. The surface of the material is to be finished smooth by grinding followed by crack detection.

1.10.15 Where fabricated and welded components require to be machined, all major welding operations are to be completed prior to final machining.

1.10.16 Welding to parts which are subjected to rotating fatigue (e.g. shafts) is not generally permitted.

1.10.17 Welding onto parts that have been hardened for wear resistance or strength (e.g. gear teeth) is not permitted.

1.10.18 Where welding of clad ferritic steel plates is to be undertaken, the clad materials are to be ground back from the prepared edge by at least 10 mm. In general, the ferritic materials are to be welded prior to welding of the cladding material.

1.11 Non-destructive examination of welds

1.11.1 Non-destructive examinations are to be made in accordance with a definitive written procedure prepared and endorsed by a person qualified according to a Nationally Recognised Scheme with a grade equivalent to level III qualification of ISO 9712, SNT-TC-1A, EN473, or ASNT Central Certification Program (ACCP). As a minimum, the procedure will identify personnel qualification levels, NDE datum and identification system, extent of testing, methods to be applied with technique sheets, acceptance criteria and reporting requirements. These procedures are to be approved by the Surveyor.

1.11.2 Non-destructive examinations are to be undertaken by personnel qualified according to a Nationally Recognised Scheme with a grade equivalent to level II qualification of ISO 9712, SNT-TC-1A, EN473 or ASNT Central Certification Program (ACCP). Operators qualified to Level I of the above schemes (or equivalent recognised by LR) may be engaged in testing under the supervision of personnel qualified to Level II or III (or equivalent recognised by LR). Personnel qualifications are to be verified by certification.

1.11.3 Effective arrangements are to be provided by the manufacturer for the inspection of finished welds to ensure that all welding, and where necessary, all post-weld heat treatment, has been satisfactorily completed.

1.11.4 Welds are to be clean and free from paint at the time of visual inspection unless specified otherwise in the following Sections.

1.11.5 The weld surface finish is to ensure accurate and reliable detection of defects. Where the weld surface is irregular or has other features likely to interfere with the interpretation of non-destructive examination, the weld is to be ground or machined.

1.11.6 Prior to inspection, welded temporary attachments and lifting eyes used to aid construction are to be removed carefully by grinding, cutting or chipping or other approved means. The surface of the material is to be finished smooth by grinding followed by crack detection. Any defects caused in the removal process are to be repaired.

1.11.7 For welds in steels with specified yield strength up to 400 N/mm², and with carbon equivalent less than or equal to 0.41 per cent, NDE may be performed as soon as the test assembly has cooled to ambient temperature. For other steels, NDE is to be delayed for a period of at least 48 hours after the test assembly has cooled to ambient temperature.

1.11.8 Non-destructive examinations are to be performed in accordance with the requirements of the Rules. Examinations are to be in accordance with agreed written procedures prepared by the manufacturer or ship builder.

1.11.9 The Surveyor may request additional inspections where there is reason to question the quality of workmanship, or where the weld is part of a complicated fabrication where there is high restraint or high residual stresses.

1.11.10 Welds are to be examined after completion of any post-weld heat treatment.

1.11.11 Where weld defects are discovered, the full extent is to be ascertained by applying additional non-destructive examinations where required. Unacceptable defects are to be completely removed and, where necessary, weld repaired in accordance with the relevant Sections of this Chapter.

1.11.12 Results of non-destructive examinations are to be recorded and evaluated by the constructor on a continual basis in order that the quality of welding can be monitored. These records are to be available to the Surveyor.

1.11.13 The constructor is to be responsible for the review, interpretation, evaluation and acceptance of the results of NDE. Reports stating compliance or otherwise with the criteria established in the inspection procedure are to be issued. Reports are to include the following information where appropriate:

- (a) date of inspection;
- (b) names, qualifications and signatures of operator and supervisor;
- (c) component identification;
- (d) weld identification, location and extent of testing;
- (e) steel grade, type of joint, thickness of parent material, welding process;
- (f) heat treatment status;
- (g) test standard used;
- (h) acceptance criteria;

Requirements for Welded Construction

Chapter 13

Section 1

- (j) surface condition;
- (k) inspection procedure reference;
- (l) test equipment used;
- (m) any test limitations, viewing conditions and temperature;
- (n) statement of final acceptability to established criteria.

1.11.14 The extent of applied non-destructive examination is to be increased when warranted by the analysis of previous results.

1.12 Routine weld tests

1.12.1 Routine or production weld tests may be specified as a means of monitoring the quality of the welded joints. This type of quality control test is generally specified for pressure vessel and LNG construction but may be used for other types of welded fabrication.

1.12.2 Routine weld tests may be requested by the Surveyor where there is reason to doubt the quality of workmanship.

1.12.3 Where routine test welds have been agreed, they are to be performed in accordance with the general requirements for the type of construction, see Sections 3 and 4.

1.13 Rectification of material defects

1.13.1 Repair of defects found in base materials is not to be carried out without the prior approval of the Surveyor.

1.13.2 In general, surface defects in the material may be removed by grinding, chipping, etc., provided the remaining material thickness is not reduced below the minimum thickness tolerance, and the area is ground to blend in smoothly with the surrounding material.

1.13.3 Confirmation that the defect has been removed is required by performing visual examination, augmented by either magnetic particle or dye penetrant examination techniques.

1.13.4 Surface defects, which cannot be repaired by the above method, may be repaired by welding where permitted by Chapters 3 to 9. Such repairs are to be performed in accordance with the requirements of this Section and those specified in Chapters 3 to 9.

1.13.5 Any defects in the structure resulting from the removal of temporary attachments are to be prepared, efficiently welded and ground smooth so as to achieve a defect free repair.

1.14 Rectification of distortion

1.14.1 Fairing, by linear or spot heating, to correct distortions due to welding, may be carried out. In order to ensure that the properties of the material are not adversely affected, approved procedures are to be utilised. On completion of such processes, visual examination of all heat affected areas in the vicinity is to be carried out to ensure freedom from cracking.

1.14.2 When misalignment of members exceeds the agreed tolerance, the misaligned item is to be cut apart, realigned and re-welded in accordance with an approved procedure.

1.15 Rectification of welds defects

1.15.1 Where repairs are extensive the manufacturer is to investigate the reason for the defects and take the necessary actions to prevent recurrence. In addition, consideration is to be given to the sequence of repairs and to providing temporary supports to prevent misalignment or collapse.

1.15.2 Cracks are to be reported to the Surveyor and the cause established prior to undertaking weld repairs.

1.15.3 Defects may be removed by grinding, chipping or thermal gouging. Where thermal gouging is used, the repair groove is to be subsequently ground clean to remove oxides and debris. The groove is to have a profile suitable for welding.

1.15.4 Prior to commencing repair welding, it is to be confirmed that no defect exists on the prepared surface by performing visual examination, augmented by either magnetic particle or dye penetrant examination techniques.

1.15.5 Repair welding is to be performed using approved welding procedures.

1.15.6 Completed repairs are to be re-examined by the non-destructive examination method(s) that detected the original defect and are to confirm that the original defect has been removed.

1.15.7 Where the component or structure has been subjected to post-weld heat treatment prior to weld repair, this is to be repeated after completion of all repair welding.

1.15.8 Where non-destructive examination reveals that the original defect has not been successfully removed, one more repair attempt may be performed.

1.15.9 The manufacturer is to monitor the quality of welding and maintain records of welding repairs and take the necessary corrective actions where repair rates are outside normal limits.

1.16 Post-weld heat treatment

1.16.1 On completion of welding, post-weld heat treatment may be required depending on the type of welded construction, the material type and thickness as specified by the relevant Parts or Sections of the Rules.

1.16.2 In general, heat treatment after welding is to be a stress relief treatment in order to reduce residual stresses introduced by welding and is generally applicable to ferritic steels. Where other types of heat treatment (e.g. normalising, solution annealing) are proposed, demonstration of acceptable mechanical properties of the weldment are to be confirmed by a welding procedure test which includes a simulated heat treatment.

Requirements for Welded Construction

Chapter 13

Sections 1 & 2

1.16.3 Parts are to be properly prepared for heat treatment. Machined surfaces (e.g. flange faces, screw threads, etc.) are to be protected against scaling and sufficient temporary supports provided to prevent distortion or collapse of the structure.

1.16.4 Details of the heat treatment to be applied, soaking time and temperature, heating and cooling rates, etc., are to be submitted for review prior to commencing.

1.16.5 Post-weld heat treatment is to be carried out in a purpose built furnace which is efficiently maintained. In special cases, where the configuration of the component is such that thermal stresses during heating and cooling can be minimised, local post-weld heat treatment may be used. This would not normally apply to the complex geometry of cast materials during manufacture within the foundry environment.

1.16.6 In all cases, the heat treatment facilities and arrangements are to be capable of controlling the temperature throughout the heat treatment cycle and adequate means of measuring and recording the component temperature are to be provided. Thermocouples are to be attached so they are in contact with the component.

1.16.7 Unless specified otherwise, stress relief heat treatment is to be carried out by means of controlled heating from 300°C, to the soak temperature, holding within the prescribed soaking temperature range for the time specified (usually 1 hour per 25 mm of weld thickness) followed by controlled cooling to below 300°C.

1.16.8 Where post-weld stress relief is specified for welded constructions that contain joints between different materials (e.g. ferritic to austenitic steels), the details of the materials, welding procedures and heat treatment cycle to be applied are to be submitted for special consideration and approval.

1.16.9 Non-destructive examination of welds is to be performed after completion of any heat treatment.

1.17 Certification

1.17.1 Products or components are not to be considered complete until all the requirements of the construction specification have been met and all activities have been completed.

1.17.2 Upon completion of the works, the manufacturer is to provide documentation which indicates that:

- (a) All welds are complete and there are no outstanding repairs.
- (b) The appropriate post-weld heat treatments have been performed.
- (c) Appropriate destructive tests have been performed.
- (d) Proof testing of welds has been performed.

1.17.3 Before the test certificates or shipping statements are signed by the Surveyor, the manufacturer is required to provide a written declaration stating that the product is in accordance with the requirements of 1.17.2.

Section 2

Specific requirements for ship hull structure and machinery

2.1 Scope

2.1.1 The requirements of this Section apply to the construction of ships, including hull structure, superstructure and deckhouses, components forming part of the ship structure and its machinery (excluding pressure equipment and piping, see Section 4). These requirements are in addition to the general welding requirements specified in Section 1.

2.1.2 The shipyard and manufacturer's works are to be assessed to give assurance that they have the facilities, equipment, personnel and quality control procedures to produce work of the required quality.

2.2 Welding consumables

2.2.1 Welding consumables used for hull construction are to be approved in accordance with Chapter 11 and are to be suitable for the type of joint and grade of material to be welded.

2.2.2 Steel welding consumable approvals, up to and including Grade Y40, are considered acceptable for hull construction in line with Table 11.1.1 in Chapter 11, Ch 12, 2.2.2 in Chapter 12 and the following:

- (a) Consumables are acceptable for welding steels up to 3 strength levels below that for which the approval applies, e.g. a consumable with approval grading 3Y is acceptable for welding EH36, EH32 and EH27S higher tensile ship steels and grade E normal strength ship steel.
- (b) Consumables with an approved impact toughness grading are acceptable for welding steels with lower specified impact properties subject to (a) above, e.g. a consumable with approval grading 3Y is acceptable for welding EH, DH and AH materials.
- (c) For welding steels of different grades or different strength levels, the welding consumables may be of a type suitable for the lesser grade or strength being connected. The use of a higher grade of welding consumable may be required at discontinuities or other points of stress concentration.

2.2.3 In general, the use of preheating and hydrogen controlled welding consumables for welding of ship steels up to strength grade H40 is to be in accordance with Table 13.2.1. The carbon equivalent is to be calculated from the ladle analysis using the formula given below:

$$\text{Carbon equivalent} = C + \frac{\text{Mn}}{6} + \frac{\text{Cr} + \text{Mo} + \text{V}}{5} + \frac{\text{Ni} + \text{Cu}}{15}$$

Preheat and the use of low hydrogen controlled consumables will be required for welding of steel grades higher than Grade H40.

Requirements for Welded Construction

Chapter 13

Section 2

Table 13.2.1 Preheat and consumable requirements for welding of carbon and carbon manganese steels up to strength grade H40

Carbon equivalent C_{eq}	Pre-heat	Hydrogen controlled consumables
C_{eq} equal to or less than 0,41%	Not required	Not required, see Note 3
C_{eq} above 0,41 but not exceeding 0,45%	Not required, see Notes 1 and 2	Required
C_{eq} greater than 0,45%	Required	Required
NOTES 1. Preheat may need to be applied in order to meet the maximum hardness values specified in Ch 12,2.12.6. 2. Under conditions of high restraint or low ambient temperature preheat may need to be applied. 3. Hydrogen controlled consumables may need to be considered for welding of (a) Thicker materials (i.e. > 35 mm). (b) Higher strength materials. (c) Welds subject to high restraint.		

2.2.4 All aluminium alloy welding consumables are to be approved in accordance with Chapter 11 and are suitable for welding the grades of material as shown in Table 13.2.2.

Table 13.2.2 Welding of aluminium alloys – Consumable requirements

Consumable approval grade	Base material alloy grade
RA or WA	5754
RB or WB	5086, 5754
RC or WC	5083, 5086, 5754
RD or WD	6005A, 6061, 6082

2.2.5 All austenitic stainless steel and duplex stainless steel welding consumables are to be approved in accordance with the Chapter 11 and are suitable for welding the grades of material as shown in Table 13.2.3.

2.3 Welding procedure and welder qualifications

2.3.1 Welding procedures and welder qualifications are to be tested and approved in accordance with the requirements of Chapter 12.

2.4 Construction and workmanship

2.4.1 Weld preparations and openings may be formed by thermal cutting, machining or chipping. Chipped surfaces that will not be subsequently covered by weld metal are to be ground smooth.

Table 13.2.3 Welding of austenitic stainless and duplex stainless steels – Consumable requirements

Consumable approval grade	Suitable for welding material alloy grades
Austenitic stainless steels	
321 347	321 347 and 321
Austenitic stainless steel – Low carbon	
304L 304LN 316L 316LN 317L 317LN	304L 304LN and 304L 316L and 304L 316LN, 316L, 304LN and 304L 317L, 316LN, 316L, 304LN and 304L 317LN, 317L, 316LN, 316L, 304LN and 304L
Super austenitic stainless steels, see Note 2	
S31254 N08904	S31254 and N08904 N08904
Duplex stainless steels, see Note 1	
S31260 S31803 S32550 S32750 S32760	S31260 and S31803 S31803 S32550 S32750 and S32550 S32760, S32550, S31260 and S31803
Stainless steels welded to carbon steels	
SS/CMn Duplex/CMn	Carbon steel to all steels in Sections 1, 2 and 3 Carbon steel to all duplex stainless steel in Section 4
NOTES 1. The use of a different welding consumable grade from that of the base material may require demonstration of acceptable corrosion properties. 2. May be used for welding low carbon austenitic grades provided measures are taken to prevent solidification cracking from occurring.	

2.4.2 Prior to welding, the alignment of plates and stiffeners forming part of the hull structure is to be in accordance with the tolerances specified in the relevant part of the Rules.

2.4.3 When welding from one side only, care is to be exercised to ensure the root gap and fit up are in accordance with the approved welding procedure and the root is properly fused.

2.4.4 Where it is proposed to use permanent backing strips, the intended locations and welding procedures are to be submitted for consideration.

2.4.5 Temporary backing strips may be used provided they are in accordance with approved welding procedures and are subsequently removed on completion of welding.

Requirements for Welded Construction

Chapter 13

Section 2

2.4.6 The outer surfaces of completed welds are to blend smoothly with the base materials and provide a smooth transition and gradual change of section.

2.4.7 Weld joints in parts of oil engine structures that are stressed by the main gas or inertia loads are to be designed as continuous full penetration welds. They are to be arranged so that welds do not intersect, and that welding can be effected without difficulty.

2.4.8 When modifications or repairs have been made which result in openings having to be closed by welded inserts, particular care is to be given to the fit of the insert and the welding sequence. The welding is also to be subject to non-destructive examination.

2.4.9 Where welding of aluminium alloy is employed, the following additional requirements are to be complied with so far as they are applicable:

- (a) Welding is to be performed by fusion welding using inert gas or tungsten inert gas process or by the friction stir welding process. Where it is proposed to use other welding processes, details are to be submitted for approval.
- (b) The weld joint surfaces should be scratch brushed, preferably immediately before welding, in order to remove oxide or adhering films of dirt, filings, etc.

2.5 Butt welds

2.5.1 Where the ship hull is constructed of plates of different thicknesses, the thicker plates are to be chamfered in accordance with the approved plans. In all cases the chamfer is not to exceed a slope of 1 in 3 so that the plates are of equal thickness at the weld seam. Alternatively, if so desired, the width of the weld may be included as part of the smooth taper to the thicker plate provided the difference in thickness is not greater than 3 mm.

2.5.2 Where stiffening members are attached by continuous fillet welds and cross completely finished butt or seam welds, these are to be made flush in way of the fillet weld. Similarly for butt welds in webs of stiffening members, the butt weld is to be complete and generally made flush with the stiffening member before the fillet weld is made. Where these conditions cannot be complied with, a scallop is to be arranged in the web of the stiffening member, see Fig. 13.2.1. Scallops are to be of such a size and in such a position that a satisfactory weld can be made.

2.6 Lap connections

2.6.1 Overlaps are generally not to be used to connect plates which may be subjected to high tensile or compressive loading and alternative arrangements are to be considered. However, where plate overlaps are adopted, the width of the overlap is not to exceed four times, nor be less than three times the thickness of the thinner plate and the joints are to be positioned to allow adequate access for completion of sound welds. The faying surfaces of lap joints are to be in close contact and both edges of the overlap are to have continuous fillet welds.

Fig. 13.2.1 Weld types

2.7 Closing plates

2.7.1 For the connection of plating to internal webs, where access for welding is not practicable, the closing plating is to be attached by continuous full penetration welds or by slot fillet welds to face plates fitted to the webs. Slots are to have a minimum length of 90 mm and a minimum width of twice the plating thickness, with well rounded ends. Slots cut in plating are to be smooth and clean and are to be spaced not more than 230 mm apart, centre to centre. Slots are not to be filled with welding.

2.7.2 For the attachment of rudder shell plating to the internal stiffening of the rudder, slots are to have a minimum length of 75 mm and, in general, a minimum width of twice the side plating thickness. The ends of the slots are to be rounded and the space between them is not to exceed 150 mm.

2.8 Stud welding

2.8.1 Where permanent or temporary studs are to be attached by welding to main structural parts in areas subject to high stress, the proposed location of the studs and the welding procedures adopted are to be approved.

Requirements for Welded Construction

Chapter 13

Section 2

2.9 Fillet welds

2.9.1 T-connections are generally to be made by fillet welds on both sides of the abutting plate, the dimensions and spacing of which are shown in Fig. 13.2.1. Where the connection is highly stressed, deep penetration or full penetration welding may be required. Where full penetration welding is required, the abutting plate may be required to be bevelled.

2.9.2 Where an approved deep penetration procedure is used, the fillet leg length calculated may be reduced by 15 per cent provided that the manufacturer is able to meet the following requirements:

- (a) Use of a welding consumable approved for deep penetration welding in accordance with Chapter 11 for either the 'p' or 'T' techniques.
- (b) Demonstrations by way of production weld testing that the minimum required penetration depths (i.e. throat thicknesses) are maintained. This is to be documented on a monthly basis by the manufacturer and be available to the Surveyor.

2.9.3 The calculated fillet leg length may be reduced by 20 per cent, provided that in addition to the requirements of 2.9.2(a) and (b), the manufacturer is able to consistently meet the following additional requirements:

- (a) The documentation required in 2.9.2(b) is to be completed and made available to the Surveyor upon request on a weekly basis.
- (b) Suitable process selection confirmed by satisfactory welding procedure tests covering both minimum and maximum root gaps.

2.9.4 Where intermittent welding is used, the welding is to be made continuous in way of brackets, lugs and scallops and at orthogonal connections with other members.

2.10 Post-weld heat treatment

2.10.1 Post-weld stress relief heat treatment is applied to improve the fatigue performance or to improve resistance to brittle fracture and is generally required for carbon and carbon-manganese and low alloy steels under any of the following conditions:

- (a) Where the material thickness exceeds 65 mm.
- (b) For complicated weld joints where there are high stress concentrations.
- (c) Where fatigue loads are considered high.

2.10.2 Post-weld heat treatment is to be applied to the following types of welded construction:

- (a) Welding of steel castings where the thickness of the casting at the weld exceeds 30 mm.
- (b) Oil engine bedplates except engine types where the bedplate as a whole is not subjected to direct loading from the cylinder pressure. For these types, only the transverse girder assemblies need to be stress relieved.
- (c) Welding of gear wheels.
- (d) Welding of gear cases associated with main or auxiliary engines, see Part 5 of the Rules for Ships.

2.10.3 Where required, heat treatment is to be performed in accordance with the requirements specified in 4.6 for pressure vessel construction.

2.10.4 Special consideration may be given to omit the required post-weld heat treatment. Evaluation is to be based on critical engineering assessment involving fracture mechanics testing and proposals are to be submitted which include full details of the application, materials, welding procedures, inspection procedures, design stresses, fatigue loads and cycles. Evidence will be required to demonstrate that the inspection techniques and procedures to be employed are able to detect flaws down to the sizes determined from the fracture mechanics (and or fatigue) calculations.

2.11 Tolerances

2.11.1 Tolerances after welding are to be in accordance with the relevant Part of the Rules.

2.11.2 Distortion which has resulted from welding may be corrected by spot heating in accordance with 1.14.

2.12 Non-destructive examination of welds

2.12.1 All finished welds are to be sound and free from cracks and lack of fusion and substantially free from incomplete penetration, porosity and slag. The surfaces of welds are to be reasonably smooth and substantially free from undercut and overlap. Care is to be taken to ensure that the specified dimensions of welds have been achieved and that both excessive reinforcement and under-fill of welds is avoided.

2.12.2 Welds forming part of the hull and superstructure may be coated with a thin layer of protective primer prior to inspection provided it does not interfere with inspection and is removed, if required by the Surveyor, for closer interpretation of possible defective areas.

2.12.3 All welds are to be visually inspected by personnel designated by the builder. Visual inspection of all welds may be supplemented by other non-destructive examination techniques in cases of unclear interpretation, as considered necessary. The acceptance criteria for visual testing are given in Table 13.2.4.

2.12.4 In addition to visual inspection, welded joints are to be examined using any one or a combination of ultrasonic, radiographic, magnetic particle, eddy current, dye penetrant or other acceptable methods appropriate to the configuration of the weld.

2.12.5 The method to be used for the volumetric examinations of welds is the responsibility of the builder. Radiography is generally preferred for the examination of butt welds of 10 mm thickness or less. Ultrasonic testing is acceptable for welds of 10 mm thickness or greater and is to be used for the examination of full penetration tee butt or cruciform welds or joints of similar configuration.

Requirements for Welded Construction

Chapter 13

Section 2

2.12.6 The acceptance criteria for radiographic testing are given in Table 13.2.5, and those for ultrasonic testing in Table 13.2.6. Alternative NDE acceptance criteria will be subject to special consideration provided that they are equivalent to these requirements.

2.12.7 Checkpoints examined at the pre-assembly stage are to include ultrasonic testing on examples of the stop/start points of automatic welding and magnetic particle inspection of weld ends.

2.12.8 Checkpoints examined at the assembly stage are generally to be selected from those welds intended to be examined as part of the agreed quality control programme to be applied by the builder. The locations and number of checkpoints are to be approved by the Surveyor.

2.12.9 Where components of the structure are subcontracted for fabrication, the same inspection regime is to be applied as if the item had been constructed within the main contractor's works. In these cases, particular attention is to be given to highly loaded fabrications (such as stabiliser fin boxes) forming an integral part of the hull envelope.

Table 13.2.4 Acceptance criteria for visual testing, magnetic particle and liquid penetrant testing

Surface discontinuity	Classification according to ISO 6520-1	Acceptance criteria for visual testing
Crack	100	Not accepted
Lack of fusion	401	Not accepted
Incomplete root penetration in butt joints welded from one side	4021	Not accepted
Surface pore	2017	Single pore diameter $d \leq 0,25t$, for butt welds, see Note 1 $d \leq 0,25a$, for fillet welds, with maximum diameter 3 mm, see Note 1 2,5d as minimum distance to adjacent pore
Undercut in butt welds	501	Depth $\leq 0,5$ mm, whatever the length Depth $\leq 0,8$ mm, with a maximum continuous length of 90 mm, see Note 2
Undercut in fillet welds	501	Depth $\leq 0,8$ mm, whatever the length
NOTES 1. t is the plate thickness of the thinnest plate, and a is the throat of the fillet weld. 2. Adjacent undercuts separated by a distance shorter than the shortest undercut are to be regarded as a single continuous undercut.		

Table 13.2.5 Acceptance criteria for radiographic testing

Discontinuity	Classification according to ISO 6520-1	Acceptance criteria for radiographic testing, see Note 1
Crack	100	Not accepted
Lack of fusion	401	Continuous maximum length $t/2$ or 25 mm, whichever is the less, see Note 2 Intermittent cumulative length maximum t or 50 mm, whichever is less, see Note 3
Incomplete root penetration	4021	Not accepted in butt joint welded from one side
		Continuous maximum length $t/2$ or 25 mm, whichever is lesser, see Note 2 Intermittent cumulative maximum length t or 50 mm, whichever is less, see Note 3
Slag inclusion	301	Continuous maximum length t or 50 mm, whichever is less, see Note 2 Intermittent cumulative length maximum $2t$ or 100 mm, whichever is less, see Notes 3 and 4
NOTES 1. t is the thickness of the thinnest plate. 2. Two adjacent individual discontinuities of length $L1$ and $L2$ situated on a line and where the distance L between them is shorter than the shortest discontinuity are to be regarded as a continuous discontinuity of length $L1 + L + L2$ 3. Sum of the length of individual continuous discontinuities. 4. Parallel inclusions not separated by more than 3 times the width of the largest inclusion are to be regarded as one continuous discontinuity.		

Requirements for Welded Construction

Chapter 13

Section 2

Table 13.2.6 Acceptance criteria for ultrasonic testing

Echo height	Acceptance criteria for ultrasonic testing, see Note
Greater than 100% of DAC curve	Maximum length $t/2$ or 25 mm, whichever is less
Greater than 50% of DAC curve, but less than 100% of DAC curve	Maximum length t or 50 mm, whichever is less
Indications evaluated to be cracks are unacceptable regardless of echo height; Indications evaluated to be lack of penetration in joints welded from one side are unacceptable regardless of echo height.	
NOTE Two adjacent individual discontinuities of length $L1$ and $L2$ situated on a line and where the distance L between them is shorter than the shortest discontinuity are to be regarded as a continuous discontinuity of length $L1 + L + L2$.	

2.12.10 Particular attention is to be paid to highly stressed items. Magnetic particle inspection is to be used at ends of fillet welds, T-joints, joints or crossings in main structural members and at stern frame connections.

2.12.11 Special attention is to be given to the examination of plating in way of lifting eye plate positions to ensure freedom from cracks. This examination is not restricted to the positions where eye plates have been removed, but includes the positions where lifting eye plates are permanent fixtures.

2.12.12 Checkpoints for volumetric examination are to be selected so that a representative sample of welding is examined.

2.12.13 Typical locations for volumetric examination and number of checkpoints to be taken are given in the relevant Sections of the Rules. A list of the proposed items to be examined is to be submitted for approval.

2.12.14 For the hull structure of refrigerated spaces, and of ships designed to operate in low air temperatures, the extent of non-destructive examination will be specially considered. For non-destructive examination of gas ships see the *Rules for the carriage for Liquefied Gases*.

2.12.15 For all ship types, the builder is to carry out random non-destructive examination at the request of the Surveyor.

2.12.16 Results of non-destructive examinations made during construction are to be recorded and evaluated by the builder on a continual basis in order that the quality of welding can be monitored. These records are to be available to the Surveyor.

2.12.17 The extent of applied non-destructive examinations is to be increased when warranted by the analysis of previous results.

2.13 Weld repairs

2.13.1 The full extent of any weld defect is to be ascertained by applying additional non-destructive examination where required. Unacceptable defects are to be completely removed and, where necessary, re-welded and re-examined in accordance with the requirements of 1.15.

2.13.2 During the assembly of large components, root gaps in excess of those specified in the approved welding procedure may be rectified by welding.

2.13.3 Rectification of wide root gaps in butt welds, up to a maximum gap of 16 mm, may be performed provided that the length of these areas is small in relation to the whole weld length. Repairs may be executed by applying weld buttering layers to one edge of the weld joint, followed by machining or grinding to return the root opening to the required dimensions. The weld buttering and filling of the joint are to be in accordance with welding procedures qualified in accordance with Chapter 12.

2.13.4 For sub-assemblies, rectification of wide root gaps may be performed using a backing strip, provided that it is removed on completion of the welding.

2.13.5 Rectification of wide root gaps in fillet welds may be carried out as follows:

- where the root gap, g , is in excess of 3 mm, but not greater than 5 mm, the fillet leg length, z , may be increased by $g - 2,0$ mm;
- where the root gap is in excess of 5 mm, the joint detail may be changed into a full penetration weld.

2.13.6 Where repair welds are made using small weld beads, suitable precautions (including preheat) are to be taken to avoid high hardness and possible cold cracking.

2.14 Welding afloat with water backing

2.14.1 Welding afloat with water backing is not recommended due to the additional precautions required during survey and therefore, is generally not permitted. However consideration may be given to welding afloat with water backing after specific LR approval has been obtained by the yard or fabricator prior to such welding being carried out. Such approval will only be given once all of the following conditions are satisfied:

- The welding procedure qualification tests are carried out on steel plates with water backing and the water is maintained at the flow rate and minimum water temperature anticipated during fabrication.

Requirements for Welded Construction

Chapter 13

Sections 2 & 3

- (b) The carbon equivalent of the steel plates used in the welding procedure qualification tests are to be greater than 0,41 per cent based on the IIW formula. Where it can be shown that all hull steel plates and new sections will have a carbon equivalent value below this figure, steel plates with the maximum carbon equivalent value may be used for the welding procedure qualification tests.
- (c) Welding procedure qualification tests are carried out without preheat.
- (d) The thickness of steel plate used in the welding procedure qualification test is the minimum hull plate thickness to be used during fabrication.
- (e) The maximum measured hardness on the completed welding procedure qualification assembly is less than or equal to 350 HV10. Following fabrication welding, 10 per cent of welds are to be hardness tested in way of heat-affected zones at weld starts to confirm compliance with the 350 HV10 limit.
- (f) The heat input used in the welding qualification test is the minimum permitted heat input during fabrication.
- (g) Only low hydrogen welding consumables (H5) are used.
- (h) In addition to normal non-destructive testing for welds, 10 per cent of the welds are additionally subject to magnetic particle inspection 48 hours after welding is complete.
- (j) The welding procedure qualification tests for the repair of welds carried out afloat with water backing are to be carried out on test pieces that have previously been welded afloat and also meet the requirements above.

2.14.2 Welding in, or underwater, is not permitted.

Section 3 Specific requirements for fabricated steel sections

3.1 Scope

3.1.1 Fabricated steel sections are items used in place of rolled sections and as such will not be regarded as sub-assemblies. Products regarded as sub-assemblies are subject to requirements of welded construction specified in Section 2.

3.1.2 The requirements for structural steel sections are based on these being manufactured from flat products by automatic welding and intended for use in the construction of ships and other marine structures.

3.1.3 Fabricated steel sections are to be manufactured in accordance with the requirements of this Section and the general requirements of Section 1.

3.1.4 In all cases, sections are to be manufactured at works, which have been assessed and approved in accordance with *Materials and Qualification Procedures for Ships, Book J, MQPS Procedure 12-1*.

3.2 Dimensions and tolerances

3.2.1 Products are to conform dimensionally to the provisions of an acceptable National or International Standard.

3.2.2 The minimum throat thickness of fillet welds is to be determined from:

$$\text{Throat thickness} = 0,34t \text{ but not to be taken as less than } 3 \text{ mm}$$

where

t = plate thickness of the thinner member to be joined (generally the web).

3.2.3 Where a welding procedure using deep penetration welding is used (see Chapter 11, 'p' and 'T' welding techniques) the minimum leg length required will be specially considered provided the requirements of 2.9.2 are complied with.

3.2.4 Unless agreed otherwise, the leg length of the weld is to be not less than 1,4 times the specified throat thickness.

3.3 Identification of products

3.3.1 Every finished item is to be clearly marked by the manufacturer in at least one place with the following particulars:

- (a) The manufacturer's name or trade mark.
- (b) Identification mark for the grade of steel.
- (c) Identification number and/or initials which will enable the full history of the item to be traced.
- (d) Where required by the purchaser, the order number or other identification mark.
- (e) The letters 'LR'.
- (f) The Surveyor's personal stamp.

The above particulars, but excluding the manufacturer's name or trade mark where this is embossed on finished products, are to be encircled with paint or otherwise marked so as to be easily recognisable.

3.3.2 In the event of any material bearing LR's brand failing to comply with the test requirements, the brand is to be removed or unmistakably defaced, see also Ch 1,4.8.

3.4 Manufacture and workmanship

3.4.1 For cut edges that are to remain unwelded, it is to be demonstrated that the plate preparation procedures used are able to achieve edges that are free from cracks or other deleterious imperfections.

3.4.2 Where assembly jigs and devices are used to bring the web into contact with the flanges and hold these in place during welding, means are to be provided to ensure that the degree of contact is maintained until welding is complete.

3.4.3 Welding procedures are to be established for the welding of all joints including weld repairs and are to be approved in accordance with Chapter 12. Welders are to be approved in accordance with Chapter 12, and qualification records are to be available to the Surveyor.

Requirements for Welded Construction

Chapter 13

Sections 3 & 4

3.4.4 The welding consumables used are to be approved in accordance with Chapter 11 and are to be suitable for the type of joint and grade of steel as described in 2.2. For joining steel of different tensile strengths, the consumables are to be suitable for the tensile strength of the component considered in the determination of weld size.

3.4.5 The application of pre-heat and the use of low hydrogen welding consumables are to be in accordance with the requirements of 2.2.

3.4.6 Welding is to be double continuous fillet welding or full penetration welding as specified in the approved plans.

3.4.7 Where deep penetration welding is used, the requirements of 2.9.2 are to be complied with.

3.5 Non-destructive examination

3.5.1 Surface inspection and verification of dimensions are the responsibility of the manufacturer and are to be carried out on all materials prior to despatch. Acceptance by the Surveyor of material later found to be defective does not absolve the manufacturer from this responsibility.

3.5.2 The Surveyor will carry out checks to ensure that the weld size and profile are in accordance with the manufacturing specification and the manufacturer's Quality Control Procedures.

3.5.3 The manufacturer is to examine the welds by magnetic particle or dye penetrant methods. The length examined is to be 200 mm at each end, for each length cut for delivery.

3.5.4 If cracks are revealed, these are to be reported to the Surveyor and the whole of the length is to be examined by magnetic particle or dye penetrant methods. Corrective action in respect of the manufacturing process, and repairs are to be as indicated in the manufacturers' Quality Control Manual.

3.5.5 The weld defect is not to exceed the acceptance levels given in Table 13.2.4.

3.6 Routine weld tests

3.6.1 One production batch test is required for every 500 m of fabricated section manufactured, or fraction thereof. From each batch test, two samples are to be removed, one from near the beginning of the production run and one from near the end. From each of these test samples one macro specimen and one fracture test specimens are to be taken.

3.6.2 The macro specimens are to be prepared and etched to demonstrate freedom from unacceptable defects and that the weld penetration is in accordance with the manufacturing specification. The fracture specimens are to be broken, one for each side of the fillet weld and the fractured surfaces examined for compliance with the requirements of Table 13.2.5.

3.6.3 Where the welding procedure used has employed the deep penetration technique, the amount of root penetration is to be measured on the macro specimen and is not to be less than that demonstrated during welding procedure approval testing.

3.6.4 For the purposes of this Section, a batch is to consist of products of only one size and grade of material.

3.7 Certification and records

3.7.1 Each test certificate is to include the following particulars:

- (a) Purchaser's name and order number.
- (b) Where known, the contract number for which the material is intended.
- (c) Address to which material is despatched.
- (d) Description and dimensions of the product.
- (e) Specification or grade of the steel.
- (f) Identification number and/or initials.
- (g) Cast number and chemical composition of ladle samples of constituent plates.
- (h) Mechanical test results of constituent plates.
- (i) Condition of supply when other than as-rolled.
- (k) Make and brand of welding consumables.

3.7.2 Test certificates or shipping statements may be signed by the Surveyor, provided the documentation requirements of 1.17 are satisfied. The following form of declaration will be accepted if stamped or printed on each test certificate or shipping statement with the name of the works and signed by an authorised representative of the manufacturer:

'We hereby certify that the material has been made by an approved procedure in accordance with the Lloyd's Register's Rules for Materials'.

3.7.3 The manufacturer is to maintain records by which sources of material can be identified together with the results of all inspections and tests.

Section 4 Specific requirements for fusion welded pressure vessels

4.1 Scope

4.1.1 The requirements of this Section apply to fusion welded pressure vessels and process equipment, heating and steam raising boilers, and steam or gas turbine rotors and cylinders and are in addition to those requirements referred to in Section 1.

4.1.2 The allocation of pressure vessel Class is determined from the design criteria in Pt 5, Ch 10 and 11 of the Rules for Ships. Prior to commencing construction, the design of the vessel is to be approved. Construction requirements for turbine rotors and cylinders are to be in accordance with Class 2/1, unless a higher Class is specified in the approved plans.

Requirements for Welded Construction

Chapter 13

Section 4

4.1.3 Pressure vessels will be accepted only if manufactured by firms equipped and competent to undertake the quality of welding work required for the Class of vessel proposed. The manufacturer's works are to be approved in accordance with the requirements specified in *Materials and Qualification Procedures for Ships, Book A, Procedure MQPS 0-4*.

4.1.4 The term 'fusion weld', for the purpose of these requirements, is applicable to welded joints made by manual, semi-automatic, or automatic electric arc welding processes. Special consideration will be given to the proposed use of other fusion welding processes.

4.2 Cutting and forming of shells and heads

4.2.1 Cut or chipped surfaces which will not be subsequently covered by weld metal are to be ground smooth.

4.2.2 Shell plates and heads are to be formed to the correct contour up to the extreme edge of the plate.

4.2.3 Vessels manufactured from carbon or carbon manganese steel plates (see Table 3.4.1 in Chapter 3, grades 360AR to 510FG), which have been hot formed or locally heated for forming, are to be re-heat treated in accordance with the original supplied condition on completion of this operation. Vessels formed from plates supplied in the as-rolled condition are to be heat treated in accordance with the material manufacturer's recommendations.

4.2.4 Subsequent heat treatment will not be required where steels are supplied in the as-rolled, normalised or normalised and controlled rolled condition, or hot forming is carried out entirely at a temperature within the normalising range.

4.2.5 For alloy steel vessels where hot forming is employed (see Table 3.4.1 in Chapter 3, 13Cr Mo 45, etc.), the plates are to be heat treated on completion in accordance with the material manufacturer's recommendations.

4.2.6 Where plates are cold formed, subsequent heat treatment is to be performed where the internal radius is less than 10 times the plate thickness. For carbon and carbon-manganese steels this heat treatment may be a stress relief heat treatment.

4.2.7 In all cases where hot forming is employed, and for cold forming to a radius less than 10 times the thickness, the manufacturer is required to demonstrate that the forming process and subsequent heat treatments result in acceptable properties.

4.3 Fitting of shell plates and attachments

4.3.1 The location of welded joints is to be such as to avoid intersecting butt welds in the vessel shell plates. The attachment of nozzles and openings in the vessels are to be arranged to avoid main shell weld seams.

4.3.2 The surfaces of the plates at the longitudinal or circumferential seams are not to be out of alignment with each other, at any point, by more than 10 per cent of the plate thickness. In no case is the misalignment to exceed 3 mm for longitudinal seams, or 4 mm for circumferential seams.

4.3.3 Where a vessel is constructed of plates of different thicknesses (tube plate and wrapper plate), the plates are to be so arranged that their centrelines form a continuous circle.

4.3.4 For longitudinal seams, the thicker plate is to be equally chamfered inside and outside by machining over a circumferential distance not less than twice the difference in thickness, so that the plates are of equal thickness at the longitudinal weld seam. For the circumferential seam, the thickest plate is to be similarly prepared over the same distance longitudinally.

4.3.5 For the circumferential seam, where the difference in the thickness is the same throughout the circumference, the thicker plate is to be reduced in thickness by machining to a taper for a distance not less than four times the offset, so that the two plates are of equal thickness at the weld joint. A parallel portion may be provided between the end of the taper and the weld edge preparation; alternatively, if so desired, the width of the weld may be included as part of the smooth taper to the thicker plate.

4.3.6 All attachments (lugs, brackets, reinforcing plates, etc.) are to conform to the shape of the surface to which they are attached.

4.4 Welding

4.4.1 Welding procedures are to be established for all welds joining pressure containing parts and for welds made directly onto pressure containing parts. Welding procedures are to be based on qualification tests performed in accordance with Chapter 12.

4.4.2 In all cases where tack welds, in the root of the weld seam, are used to retain plates or parts in position prior to welding, they are to be removed in the process of welding the seam.

4.4.3 Steel backing strips may be used for the circumferential seams of Class 2/1, Class 2/2 and Class 3 pressure vessels and are to be the same nominal composition as the plates to be welded.

4.4.4 Fillet welds are to be made to ensure proper fusion and penetration at the root of the fillet. At least two layers of weld metal are to be deposited at each weld affixing branch pipes, flanges and seatings.

4.4.5 The outer surface of completed welds is to be at least flush with the surface of the plates joined, and any weld reinforcement is to provide a smooth transition and gradual change of section with the plate surface.

Requirements for Welded Construction

Chapter 13

Section 4

4.4.6 Where attachment of lugs, brackets, branches, manhole frames, reinforcement plates and other members are to be made to the main pressure shell by welding, this is to be to the same standard as required for the main vessel shell construction.

4.4.7 The main weld seams and all welded attachments made to pressure containing parts are to be completed prior to post weld heat treatment.

4.4.8 The finish of welds attaching pressure parts and non-pressure parts to the main pressure shell is to be such as to allow satisfactory examination of the welds. In the case of Class 1 and Class 2/1 pressure vessels, these welds are to be ground smooth, if necessary, to provide a suitable finish for examination.

4.5 General requirements for routine weld production tests

4.5.1 Routine weld production tests are specified as a means of monitoring the quality of the welded joints and are required for pressure vessel Classes 1, 2/1 and 2/2.

4.5.2 Routine production test plates are required during the manufacture of vessels and as part of the initial approval test programme for Class 1 vessel manufacturers, refer to MQPS 0-4.

4.5.3 Routine production weld tests are not required for Class 3 pressure vessels unless there are doubts about the weld quality where check tests may be requested by the Surveyor.

4.5.4 Routine production test plates are not required for circumferential seams of cylindrical pressure vessels. Spherical vessels are to have one test plate prepared having a welded joint which is a simulation of the circumferential seams.

4.5.5 Routine production weld tests may be requested by the Surveyor where there is reason to doubt the quality of workmanship.

4.6 Production test plate assembly requirements

4.6.1 Two test plates and one complete test assembly, of sufficient dimensions to provide all the required mechanical test specimens is to be prepared for each vessel and is to be welded as a continuation and simulation of the longitudinal weld joint.

4.6.2 For Class 2/2 vessels, where a large number are made concurrently at the same works using the same welding procedure and the plate thicknesses do not vary by more than 5 mm, one test may be performed for each 37 m of longitudinal plus circumferential weld seam. In these cases the thickness of the test plate is to be equal to the thickest shell plate used in the construction.

4.6.3 Where the vessel size or design results in a small number of longitudinal weld seams, one test assembly may be prepared for testing provided that the welding details are the same for each seam.

4.6.4 Test plate materials are to be the same grade, thickness and supply condition and from the same cast as that of the vessel shell. The test assembly is to be welded at the same time as the vessel weld to which it relates and is to be supported so that distortion during welding is minimised.

4.6.5 As far as practicable, welding is to be performed by different welders where there is a requirement for several routine tests to be welded.

4.6.6 The test assembly may be detached from the vessel weld only after the Surveyor has performed a visual examination and has added his mark or stamp. Straightening of test welds prior to mechanical testing is not permitted.

4.6.7 Where the pressure vessel is required to be subjected to post-weld heat treatment, the test weld is to be heat treated, after welding, in accordance with the same requirements. This may be performed separately from the vessel.

4.7 Inspection and testing

4.7.1 The test weld is to be subjected to the same type of non-destructive examination and acceptance criteria as specified for the weld seam to which the test relates. Non-destructive examination is to be performed prior to removing specimens for mechanical testing, but after any post-weld heat treatment.

4.7.2 The test weld is to be sectioned to remove the number and type of test specimens for mechanical testing as given in 4.8.

4.8 Mechanical requirements

4.8.1 The routine production test assembly is to be machined to provide the following test specimens:

- (a) Tensile.
- (b) Bend.
- (c) Hardness.
- (d) Impact (see Table 13.4.1).
- (e) Macrograph and hardness survey of full weld section.

4.8.2 One set of specimens for mechanical testing are to be removed, as shown in Figs. 13.4.1 or 13.4.2 as appropriate for the Class of approval. Impact tests are to be removed and tested where required by Table 13.4.1.

Requirements for Welded Construction

Chapter 13

Section 4

Table 13.4.1 Impact test requirements

Pressure vessel Class	Minimum design temperature	Plate material thickness t	Impact test temperature
Class 1	-10°C or above	All	5°C below the minimum design temperature or 20°C, whichever is the lower
All Classes	Below -10°C	$t \leq 20$ mm	5°C below the minimum design temperature
		$20 \text{ mm} < t \leq 40$ mm	10°C below the minimum design temperature
		Over 40 mm	Subject to special consideration

4.8.3 Longitudinal tensile test for weld metal. An all-weld metal longitudinal tensile test is required. For thicknesses in excess of 20 mm, where more than one welding process or type of consumable has been used to complete the joint, additional longitudinal tests are required from the respective area of the weld. This does not apply to the welding process or consumables used solely to deposit the root weld. Specimens are to be tested in accordance with the following requirements:

- The diameter and gauge length of the test specimen is to be in accordance with Ch 11,2.1.1.
- For carbon and carbon-manganese steels the tensile strength of the weld metal is to be not less than the minimum specified for the plate material and not more than 145 N/mm² above this value. The percentage elongation, A , is to be not less than that given by:

$$A = (980 - R) / 21.6$$
but not less than 80 per cent of the minimum elongation specified for the plate

where

R is the tensile strength, in N/mm², obtained from the all weld metal tensile tests.

- For other materials the tensile strength and percentage elongation is not to be less than that specified for the base materials welded.

4.8.4 Transverse tensile test for joint. Transverse tensile test specimens are to be removed and tested in accordance with the following requirements:

- One reduced section tensile test specimen is to be cut transversely to the weld to the dimensions shown in Ch 11,2.1.1 and the weld reinforcement is to be removed.
- In general, where the plate thickness exceeds 30 mm, or where the capacity of the tensile test machine prevents full thickness tests, each tensile test may be made up of several reduced section specimens, provided that the whole thickness of the weld is subjected to testing.
- The tensile strength obtained is to be not less than the minimum specified tensile strength for the plate material, and the location of the fracture is to be reported.

4.8.5 Transverse bend test. The bend test specimens are to be removed and tested in accordance with the following requirements:

- Two bend test specimens of rectangular section are to be cut transversely to the weld, one bent with the outer surface of the weld in tension (face bend), and the other with the inner surface in tension (root bend).
- The specimen dimensions are to be in accordance with Chapters 11 and 12.

Requirements for Welded Construction

Chapter 13

Section 4

- (c) Each specimen is to be mounted on roller supports with the centre of the weld midway between the supports. The former is to have a diameter specified in Ch 12,2.7.6 depending on the material being welded.
- (d) After bending through an angle of at least 180° there is to be no crack or defect exceeding 1,5 mm measured across the specimen or 3 mm measured along the specimen. Premature failure at the edges of the specimen is not to be cause for rejection, unless this is associated with a weld defect.

4.8.6 Macro-specimen and hardness survey. A macro examination specimen is to be removed from the test assembly near the end where welding started. The specimen is to include the complete cross-section of the weld and the heat affected zone. The specimen is to be prepared and examined in accordance with the following requirements:

- (a) The cross-section of the specimen is to be ground, polished and etched to clearly reveal the weld runs, and the heat affected zones.
- (b) The specimen is to show an even weld profile that blends smoothly with the base material and have satisfactory penetration and fusion, and an absence of significant inclusions or other defects.
- (c) Where there is doubt in the condition of the weld as shown by macro-etching, the area concerned is to be microscopically examined.

- (d) For carbon, carbon manganese and low alloy steels, a Vickers hardness survey is to be performed on the macro-specimen using either a 5 kg or 10 kg load. Testing is to include the base material, the weld and the heat affected zone. Hardness scans on the cross-section are to be performed as specified in Fig. 12.2.8. The maximum recorded hardness is to not exceed 350 Hv.

4.8.7 Charpy V-notch impact test. Charpy V notch impact test specimens are to be prepared and tested as required by Table 13.4.1 and in accordance with the following requirements:

- (a) The dimensions and tolerances of the specimens are to be in accordance with Chapter 2.
- (b) Charpy V-notch impact specimens and are to be removed with the notch perpendicular to the plate surface.
- (c) Specimens are to be removed for testing from the weld centreline and the heat affected zone (fusion line and fusion line + 2 mm locations) detailed in Fig. 12.2.6 or Fig. 12.2.7, as appropriate. Heat affected zone impact tests may be omitted where the minimum design temperature is above +20°C.
- (d) For thicknesses in excess of 20 mm, where more than one welding process or type of consumable has been used to complete the joint, impact tests are required from the respective areas of the weld. This does not apply to the welding process or consumables used solely to deposit the root weld.
- (e) The average energy of a set of three specimens is not to be less than 27 J or the minimum specified for the base material, whichever is the higher. The minimum energy for each individual specimen is to meet the requirements of Ch 1,4.5.2.

4.8.8 Nick break bend tests. A nick bend or fracture test specimen is to be a minimum of 100 mm long measured along the weld direction and is to be tested in accordance with and meet the requirements of the following:

- (a) The specimen is to have a slot cut into each side along the centreline of the weld and perpendicular to the plate surface.
- (b) The specimen is to be bent along the weld centreline until fracture occurs and the fracture faces are to be examined for defects. The weld is to be sound, with no evidence of cracking or lack of fusion or penetration and be substantially free from slag inclusions and porosity.

4.9 Failure to meet requirements

4.9.1 Where any test specimen fails to meet the requirements, additional specimens may be removed and re-tested in accordance with Ch 2,1.4.

Requirements for Welded Construction

Chapter 13

Section 4

4.9.2 Where a routine weld test fails to meet requirements, the welds to which it relates will be considered as not having met the requirements. The reason for the failure is to be established, and the manufacturer is to take such steps as necessary to either

- (a) Remove the affected welds and have them re-welded, or
- (b) Demonstrate that the affected production welds have acceptable properties.

4.10 Heat treatment

4.10.1 Fusion welded pressure vessels, where indicated in Table 13.4.2, are to be heat treated on completion of the welding of the seams and of all attachments to the shell and ends, and before the hydraulic test is carried out.

4.10.2 Tubes which have been expanded into headers or drums may be seal welded without further post-weld heat treatment.

4.10.3 Steam and gas turbine cylinders and rotors are to be subjected to post-weld heat treatment irrespective of thickness.

4.10.4 Where the weld attaches parts of different thicknesses, the thickness to be used when applying the requirements for post-weld heat treatment is to be either the thinner of the two plates for butt welded connections, or the thickness of the shell for welds to flanges, tubeplates and similar connections.

4.10.5 Care is to be exercised to provide drilled holes in double reinforcing plates and other closed spaces prior to heat treatment.

4.11 Basic requirements for heat treatment of fusion welded pressure vessels

4.11.1 Recommended soaking temperatures and soak durations for post-weld heat treatment are given in Table 13.4.3 for different materials. Where other materials are used for pressure vessel construction, full details of the proposed heat treatment are to be submitted for consideration.

4.11.2 Where pressure vessels are of dimensions that the whole length cannot be accommodated in the furnace at one time, the pressure vessels may be heated in sections, provided that sufficient overlap is allowed to ensure the heat treatment of the entire length of the longitudinal seam.

4.11.3 Where materials other than those detailed in Table 13.4.3 are used or where it is proposed to adopt special methods of heat treatment, full particulars are to be submitted for consideration. In such cases, it may be necessary to carry out tests to show the effect of the proposed heat treatment.

Table 13.4.2 Post-weld heat treatment requirements

Type of steel	Plate thickness above which post-weld heat treatment (PWHT) is required	
	Steam raising plant	Other pressure vessels
Carbon and carbon/manganese steels without low temperature impact values	20 mm	30 mm
Carbon and carbon/manganese steels with low temperature impact values	20 mm	40 mm
1Cr ½Mo	All thicknesses	All thicknesses
2¼Cr 1Mo	All thicknesses	All thicknesses
½Cr ½Mo ¼V	All thicknesses	All thicknesses
Other alloy steels	Subject to special consideration	

Table 13.4.3 Post-weld soak temperatures and times

Material type	Soak temperature (°C)	Soak period
Carbon and carbon/manganese grades	580–620°	1 hour per 25 mm of thickness, minimum of 1 hour
1Cr ½Mo	620–660°	1 hour per 25 mm of thickness, minimum of 1 hour
2¼Cr 1Mo	650–690°	1 hour per 25 mm of thickness, minimum of 1 hour
½Cr ½Mo ¼V	670–720°	1 hour per 25 mm of thickness, minimum of 1 hour
NOTE For materials supplied in the tempered condition, the post-weld heat treatment temperature is to be lower than the material tempering temperature.		

Requirements for Welded Construction

Chapter 13

Section 4

4.12 Non-Destructive Examination of welds

4.12.1 Non-Destructive Examinations (NDE) of pressure vessel welds are to be carried out in accordance with a nationally recognised code or standard.

4.12.2 NDE is not to be applied until an interval of at least 48 hours has elapsed since the completion of welding.

4.12.3 NDE Personnel are to be qualified to an appropriate level of a nationally recognised certification scheme.

4.12.4 Qualification schemes are to include assessments of practical ability for Levels I and II individuals. These examinations are to be made on representative test pieces containing relevant defects.

4.13 Extent of NDE for Class 1 pressure vessels

4.13.1 All butt welded seams in drums, shells, headers and test plates, together with tubes or nozzles with outside diameter greater than 170 mm, are subject to 100 per cent volumetric and surface crack detection inspections.

4.13.2 For circumferential butt welds in extruded connections, tubes, headers and other tubular parts with an outside diameter of 170 mm or less, at least 10 per cent of the total number of welds is to be subjected to volumetric examination and surface crack detection inspections.

4.14 Extent of NDE for Class 2/1 pressure vessels

4.14.1 For Class 2/1 pressure vessels, volumetric and surface crack detection inspections are to be applied at selected regions of each main seam. At least 10 per cent of each main seam is to be examined together with the full length of each welded test plate. When an unacceptable indication is detected, at least two additional check points in the seam are to be selected by the surveyor for examination using the same inspection method. Where further unacceptable defects are found either:

- (a) the whole length of weld represented is to be cut out and re-welded and re-examined as if it was a new weld with the test plates being similarly treated, or
- (b) the whole length of the weld represented is to be re-examined using the same inspection methods.

4.14.2 Butt welds in furnaces, combustion chambers and other pressure parts for fired pressure vessels under external pressure, are to be subject to spot volumetric examination. The minimum length for each check point is to be 300 mm.

4.14.3 The extent of NDE for turbine cylinders and rotors is to be agreed with the Surveyor.

4.15 NDE Method

4.15.1 Volumetric examinations may be made by radiography. For welds of nominal thickness greater or equal to 10 mm, the examinations may be by ultrasonic testing. The preferred method for surface crack detection in ferrous metals is magnetic particle inspection. The preferred method for non-magnetic materials is liquid penetrant inspection.

4.16 Evaluation and reports

4.16.1 The manufacturer is to be responsible for the review, interpretation, evaluation and acceptance of the results of NDE. Reports stating compliance, or non-compliance, with the criteria established in the inspection procedure are to be issued. Reports are to include the following information where appropriate:

- (a) Date of inspection.
- (b) Names, qualifications and signatures of operator and supervisor.
- (c) Component identification.
- (d) Weld identification, location and extent of testing.
- (e) Steel grade, type of joint, thickness of parent material and welding process.
- (f) Heat treatment status.
- (g) Test standard used.
- (h) Acceptance criteria.
- (i) Surface condition.
- (k) Inspection procedure reference.
- (l) Test equipment used.
- (m) Any test limitations, viewing conditions and temperature.
- (n) Results showing size, position and nature of any defects repaired.
- (o) Statement of final acceptability to established criteria.

4.17 Repair to welds

4.17.1 Where non-destructive examinations reveal unacceptable defects in the welded seams, they are to be repaired in accordance with 1.15 and are to be shown by further non-destructive examinations to have been eliminated.

4.17.2 In the case where spot radiography has revealed unacceptable defects, the requirements of 4.14.1 apply.

4.17.3 Where post-weld heat treatment is required in accordance with 4.10, weld repairs to the vessel or cylindrical shell or parts attaching to the shell are to be subjected to a subsequent heat treatment in accordance with 4.10.

4.17.4 In the event of unsuccessful weld repair of a defect, only one more repair attempt may be made of the same defect. Any subsequent repairs may require the re-repair excavation to be enlarged to remove the original repair heat affected zone.

Requirements for Welded Construction

Chapter 13

Section 5

Section 5 Specific requirements for pressure pipework

5.1 Scope

5.1.1 Fabrication of pipework is to be carried out in accordance with the requirements of this Section and the general requirements given in Section 1, unless more stringent requirements have been specified.

5.1.2 Piping systems are to be constructed in accordance with the approved plans and specifications.

5.1.3 Fabricated pipework will be accepted only if manufactured by firms that have demonstrated that they have the facilities and equipment and are competent to undertake the quality of welding required for the Class of pipework proposed.

5.2 Manufacture and workmanship

5.2.1 Pipe welding may be performed using manual, semi-automatic or fully automatic electric arc processes. The use of oxy-acetylene welding will be limited to Class 3 pipework in carbon steel or carbon/manganese material that is not for carrying flammable fluids and limited to butt joints in pipes not exceeding 100 mm diameter or 9,5 mm thickness.

5.2.2 Welding of pipework, including attachment welds directly to pressure retaining parts is to be performed in accordance with approved welding procedures that have been qualified in accordance with Chapter 12.

5.2.3 Where the work involves a significant number of branch connections, tests will be required to demonstrate that the type of joint(s) and welding techniques employed are capable of achieving the required quality.

5.2.4 Where pressure pipework is assembled and butt welded insitu, the piping is to be arranged well clear of adjacent structures to allow sufficient access for preheating, welding, heat-treatment and non-destructive examination of the joints.

5.2.5 Alignment of pipe butt welds is to be in accordance with Table 13.5.1 unless more stringent requirements have been agreed. Where fusible inserts are used, the alignment is to be within 0,5 mm in all cases.

5.2.6 The number of welds is to be kept to a minimum. The minimum separation between welds, measured toe-to-toe, is to be not be less than 75 mm. Where it is not possible to achieve this, adjacent welds are to be subjected to surface crack detection NDE.

5.2.7 Welding consumables and fusible root inserts, where used, are to be suitable for the materials being joined.

Table 13.5.1 Pipe butt weld alignment tolerances

Pipe size	Maximum permitted misalignment
$D < 150 \text{ mm}$ and $t \leq 6 \text{ mm}$	1,0 mm or 25% of t , whichever is the lesser
$D < 300 \text{ mm}$ and $t \leq 9,5 \text{ mm}$	1,5 mm or 25% of t , whichever is the lesser
$D \geq 300$ and $t > 9,5 \text{ mm}$	2,0 mm or 25% of t , whichever is the lesser
where D = pipe internal diameter t = pipe wall thickness	

5.2.8 Acceptable methods of flange attachment are to be used, see Fig. 12.2.2 in Pt 5, Ch 12 of the Rules for Ships. Where backing rings are used with flange type (a) they are to fit closely to the bore of the pipe and be removed after welding. The rings are to be made of the same material as the pipes. The use of flange types (b) and (c) with alloy steel pipes is limited to pipes up to and including 168,3 mm outside diameter.

5.2.9 Where socket welded fittings are employed, the diametrical clearance between the outside diameter of the pipe and the base of the fitting is not to exceed 0,8 mm, and a gap of approximately 1,5 mm is to be provided between the end of the pipe and the internal step at the bottom of the socket.

5.2.10 For welding of carbon, carbon/manganese and low alloy steels, the preheat to be applied will be dependent on the material grade, thickness and hydrogen grading of the welding consumable in accordance with Table 13.5.2, unless welding procedure testing indicates that a higher level is required.

5.2.11 Welding without filler metal is generally not permitted for welding of duplex stainless steel materials.

5.2.12 All welds in high pressure, high temperature pipelines are to have a smooth surface finish and even contour; and where necessary, made smooth by grinding.

5.2.13 Check tests of the quality of the welding are to be carried out periodically.

5.3 Heat treatment after bending of pipes

5.3.1 After forming or bending of pipes, the heat treatments specified in this Section are to be applied unless the pipe material manufacturer specifies or recommends other requirements.

Requirements for Welded Construction

Chapter 13

Section 5

Table 13.5.2 Welding preheat levels for pipework

Material Grade	Thickness, <i>t</i> (mm) see Note 4	Minimum preheat temperature (°C) See Note 1	
		Non-low H ₂	Low H ₂ see Note 2
Carbon and carbon/manganese grades: 320 and 360	$t \leq 15$ $t \geq 15$	50 100	10 50
Carbon and carbon/manganese grades: 410, 460 and 490	$t \leq 15$ $t \geq 15$	75 150	20 100
1Cr ½Mo	$t < 13$ $t \geq 13$	See Note 3	100 150
2¼Cr 1Mo	$t < 13$ $t \geq 13$	See Note 3	150 200
½Cr ½Mo ¼V	$t < 13$ $t \geq 13$	See Note 3	150 200

NOTES

- Where the ambient temperature is 0°C or below, pre-warming of the weld joint is required in all cases.
- Low hydrogen process or consumables are those that have been tested and have achieved a grading of H15 or better (see Chapter 11).
- Low hydrogen welding process is required for these materials.
- t = the thickness of the thinner member for butt welds, and the thicker member for fillet and branch welds.

5.3.2 Generally, hot forming is to be carried out within the normalising temperature range. When carried out within this temperature range, no subsequent heat treatment is required for carbon and carbon/manganese steels. For alloy steels, 1Cr ½Mo, 2¼Cr 1Mo and ½Cr ½Mo ¼V, a subsequent tempering heat treatment in accordance with the temperatures and times specified in Table 13.5.3 is required, irrespective of material thickness.

5.3.3 When hot forming is performed outside the normalising temperature range, a subsequent heat treatment in accordance with Table 13.5.3 is required.

5.3.4 After cold forming to a radius (measured at the centreline of the pipe) of less than four times the outside diameter, heat treatment in accordance with Table 13.5.3 is required.

Table 13.5.3 Heat treatment after bending of pipes

Type of steel	Heat treatment required
Carbon and carbon/manganese: Grades 320, 360, 410, 460 and 490	Normalise at 880 to 940°C
1Cr ½Mo	Normalise at 900 to 940°C, followed by tempering at 640 to 720°C
2¼Cr 1Mo	Normalise at 900 to 960°C, followed by tempering at 650 to 780°C
½Cr ½Mo ¼V	Normalise at 930 to 980°C, followed by tempering at 670 to 720°C
Other alloy steels	Subject to special consideration

5.3.5 Heat treatment should be carried out in accordance with 1.16.

5.3.6 Bending procedures and subsequent heat treatment for other alloy steels will be subject to special consideration.

5.4 Post-weld heat treatment

5.4.1 Post-weld heat treatment is to be carried out in accordance with the general requirements specified in 1.16 and 4.10.

5.4.2 The thickness limits, the recommended soaking temperatures and periods, for application of post-weld heat treatment are given in Table 13.5.4.

5.4.3 Where the use of oxy-acetylene welding is proposed, due consideration is to be given to the need for normalising and tempering after such welding.

5.5 Non-destructive examination

5.5.1 Non-destructive examination of pipe welds is to be carried out in accordance with the general requirements of 1.11 and the following.

5.5.2 Butt welds in Class 1 pipes with an outside diameter greater or equal to 75 mm are to be subject to 100 per cent volumetric and visual inspections. Consideration is to be given to the extent and method of testing applied to butt welds in Class 1 pipes with an outside diameter less than 75 mm.

Requirements for Welded Construction

Chapter 13

Sections 5 & 6

Table 13.5.4 Post-weld heat treatment requirements for pipework

Material Grade	Thickness for which post-weld heat treatment is required	Soak temperature (°C) see Note 2	Soak period
Carbon and carbon/manganese grades: 320, 360, 410, 460, 490	Over 30 mm	580–620°C	1 hour per 25 mm of thickness, minimum of 1 hour
1Cr ½Mo	Over 8 mm	620–660°C	1 hour per 25 mm of thickness, minimum of 1 hour
2¼Cr 1Mo	All	650–690°C	1 hour per 25 mm of thickness, minimum of 1 hour
½Cr ½Mo ¼V	All, see Note 1	670–720°C	1 hour per 25 mm of thickness, minimum of 1 hour
<p>NOTES</p> <p>1. Heat treatment may be omitted for thicknesses up to 8 mm and diameters not exceeding 100 mm provided welding procedure tests have demonstrated acceptable properties in the as welded condition.</p> <p>2. For materials supplied in the tempered condition, the post weld heat treatment temperature is to be at least 20°C less than the material tempering temperature.</p>			

5.5.3 The extent of testing to be applied to butt welds or fillet welds in Class II pipes with an outside diameter greater or equal to 100 mm is at the Surveyor's discretion.

5.5.4 NDE is not required for Class II pipes with a diameter less than 100 mm.

5.5.5 Non-destructive examination procedures, methods and the evaluation of reports are to be in accordance with 4.15 and 4.16.

5.6 Repairs to pipe welds

5.6.1 Where non-destructive examinations reveal unacceptable defects in a weld, the defects are to be removed and repaired in accordance with 1.15. Completed repairs are to be shown by further non-destructive examination to have eliminated the defects.

5.6.2 For pipes with diameter less than 88 mm and where unacceptable defects have been found during non-destructive examination, consideration is to be given to cutting the weld out completely, re-making the weld preparation and re-welding as a new joint (because of the difficulty of making small repairs).

5.6.3 Where repeated weld repairs have to be made to a weld, only two such attempts are to be permitted, thereafter the weld is to be cut apart and removed, and re-welded as a new joint.

5.6.4 Where pipework requires post-weld heat treatment weld, repairs to the pressure retaining parts are to be subjected to a subsequent heat treatment. Similarly, where welding is conducted after pressure testing, a further pressure test is to be required unless specific exemption has been agreed.

Section 6 Repair of existing ships by welding

6.1 Scope

6.1.1 This Section specifies requirements for repairs made by welding after introduction into service. This Section includes defects to hull structures, machinery, equipment and components. It also includes replacement of structure due to damage or corrosion. These requirements are in addition to those specified in the preceding Sections of this Chapter.

6.1.2 These requirements apply unless the original builder or manufacturer has specified alternative requirements.

6.2 Materials used for repairs

6.2.1 Permanent materials used in the repair are to be in accordance with 1.3.

6.2.2 Prior to commencing any welding, the material grades present in the original structure in way of the repair are to be determined. Where the materials cannot be identified from the ship records, test samples may be removed for chemical analysis and mechanical testing in order to determine the material grades.

6.2.3 Temporary materials that are to be welded to the main structure to assist in executing the repairs, but removed on completion, are to be of weldable quality.

6.3 Workmanship

6.3.1 A repair method is to be established by the shipyard or repair yard and is to be agreed by the Surveyor prior to commencing any repair work.

Requirements for Welded Construction

Chapter 13

Sections 6 & 7

6.3.2 The removal of crack-like defects is to be confirmed by visual examination and surface crack detection NDE. This may be augmented by ultrasonic examination where several defects are reported at different depths at the same location.

6.3.3 The weld joint or groove shape used for the repair is to have a profile suitable for welding.

6.3.4 The weld area is to be carefully cleaned, in particular, where the material surface has been painted or has been subjected to an oily or greasy environment.

6.4 Non-destructive examination

6.4.1 On completion of welding and any post-weld heat treatment, repair welds are to be subjected to the type and extent of NDE and assessed in accordance with the acceptance criteria specified for the original construction.

6.4.2 Where the original construction specification did not specify NDE, the completed welds are to be, as a minimum, subject to visual examination. Consideration of other NDE techniques is to take due cognisance of the location or the repair within the vessel.

6.4.3 Where spot NDE is applied and defects are found, the extent of NDE is to be increased to include an equal amount of weld length. Where this reveals unacceptable defects, either the whole weld will be rejected or the extent of inspection increased to 100 per cent examination.

6.4.4 The acceptance criteria to be applied are to generally be in accordance with the original build specification. Where conflict of requirements exist, the NDE acceptance limits for welding procedure tests specified in Ch 12,2.5.5 may be used as a minimum requirement.

6.5 Repairs to welds defects

6.5.1 Where NDE reveals unacceptable defects, these are to be repaired in accordance with 1.15.

Section 7 Austenitic and duplex stainless steel – Specific requirements

7.1 Scope

7.1.1 This Section specifies requirements for the fabrication and welding of austenitic and duplex stainless steels, and is in addition to those detailed above.

7.1.2 Fabrication and welding of these materials is to be in designated areas which are separated from those used for other materials, such as carbon steels and copper alloys. Where work is performed in the same workshop as other materials, adequate barriers or screening are to be provided to prevent cross-contamination of different material types.

7.1.3 All tools and equipment used are to be suitable for use on stainless steel materials. The use of tools or equipment made of carbon steel materials is to be avoided. It is permissible to use carbon steel tools provided that the surfaces that come into contact with the austenitic and duplex stainless materials are protected with an austenitic or nickel base alloy.

7.2 Design

7.2.1 Care is to be exercised in the weld design to prevent crevice corrosion from occurring, particularly where austenitic materials are used. In this respect fillet welds and partial penetration welds are to be continuous and welded on both sides of the joint.

7.3 Forming and bending

7.3.1 Materials that are cold formed, such that the total strain exceeds 15 per cent (i.e. where the formed diameter to thickness ratio is less than 6:1) are to be subjected to a subsequent softening heat treatment in accordance with the material manufacturers recommendations, unless it is demonstrated by testing that the material properties are acceptable in the 'as formed' condition.

7.3.2 Materials may be hot formed provided that a subsequent softening heat treatment is carried out. The forming process and the subsequent heat treatment are to be in accordance with the material manufacturer's recommendations.

7.4 Fabrication and welding

7.4.1 Welding may be performed using shielded manual arc welding (SMAW), gas tungsten arc welding (GTAW), MIG/MAG welding (GMAW), flux cored arc welding (FCAW), plasma arc welding (PAW) and submerged arc welding (SAW). The use of other welding processes will be subject to special consideration and will require submission of the process details, consumables and the weld properties achieved.

7.4.2 Misalignment may be corrected by the application of steady even force (e.g. using hydraulic or screw-type clamps). Hammering or heating is not permitted.

7.4.3 For full penetration welds, a backing or shielding gas is to be provided to prevent oxidation of the root weld. The backing gas is to be maintained until completion of, at least, the root and first fill layer. The backing gas may be omitted where the weld is back gouged or ground to remove the root weld.

7.4.4 Shielding and backing gases are to be an inert type of high purity and oxygen free.

7.4.5 For welding of Duplex stainless, the use of backing gases that contain up to 2 per cent nitrogen is permitted.

7.4.6 Welding of duplex stainless steels without filler metal is generally not permitted.

Requirements for Welded Construction

Chapter 13

Section 7

7.4.7 Degreasing agents, acid solutions, washing water etc. used for cleaning and any marking crayons and paints used are to be free of chlorides.

7.5 Repairs

7.5.1 Correction of distortion by the application of heat is not permitted.

Section

- 1 **General requirements**
- 2 **Tests on polymers, resins, reinforcements and associated materials**
- 3 **Testing procedures**
- 4 **Plastics pipes and fittings**
- 5 **Control of material quality for composite construction**

■ Section 1 General requirements

1.1 Scope

1.1.1 Provision is made in this Chapter for the manufacture and testing of plastics pipes, together with approval requirements for base materials used in the construction or repair of composite vessels, other marine structures, piping and any associated machinery components and fittings which are to be certified or are intended for classification.

1.1.2 These materials and products are to be manufactured and surveyed in accordance with the general requirements of Sections 1, 2 and 3.

1.1.3 For base materials, the manufacturer's works do not require approval by Lloyd's Register (hereinafter referred to as 'LR'), however the Quality Control procedures must be acceptable in accordance with the appropriate Section of this Chapter.

1.1.4 Where a requirement exists for the material to be approved, the test requirements and information to be submitted for approval of polymers, resins, reinforcements and associated materials are defined in Sections 2 and 3.

1.1.5 Specific material requirements relating to the design and manufacture of plastics pipes and fittings are indicated in Section 4, with the material requirements for hull structures contained in Section 5.

1.1.6 For Builders constructing composite vessels, Section 5 provides the minimum material control requirements for acceptance of the works by LR.

1.1.7 For the purposes of these Rules the following definitions apply:

- (a) A 'plastics material' is regarded as an organic substance which may be thermosetting or thermoplastic and which, in its finished state, may contain reinforcements or additives.
- (b) 'Approved' or 'accepted' refers to materials which hold a valid Certificate, Statement of Acceptance, or Letter of Non-Objection issued by LR.

1.2 Information on material quality and application

1.2.1 Where plastics products are to be classed or certified, the manufacturer is to provide the material producer with such information as is essential to ensure that the base materials to be used are in accordance with the approval requirements and the product specification. This information is to include any survey requirements for the materials.

1.3 Manufacture

1.3.1 Plastics products are to be made at works which have been approved (or accepted) for the type of product being supplied using base materials that have been approved.

1.3.2 Base materials are to be approved in accordance with the requirements of Sections 2 and 3.

1.3.3 In order that a works can be approved (or accepted), the manufacturer is required to demonstrate to the satisfaction of LR that the necessary manufacturing and testing facilities are available and are supervised by qualified personnel. A specified programme of tests is to be carried out under the supervision of the Surveyors, and the results are to be to the satisfaction of LR. When a manufacturer has more than one works, the approval (or acceptance) is only valid for the individual works which carried out the test programme.

1.4 Survey procedure

1.4.1 The Surveyors are to be allowed access to all relevant parts of the works and are to be provided with the necessary facilities and information to enable them to verify that manufacture is being carried out in accordance with the approved procedure. Facilities are also to be provided for the selection of test material, the witnessing of specified tests and the examination of materials, as required by the Rules.

1.4.2 Prior to the provision of test material for acceptance, manufacturers are to provide the Surveyors with details of the order, specification and any special conditions additional to the Rule requirements.

1.4.3 Before final acceptance, all test materials are to be confirmed as typical of the manufactured product and be submitted to the specified tests and examinations under conditions acceptable to the Surveyors. The results are to comply with the specification and any Rule requirements and are to be to the satisfaction of the Surveyors.

1.4.4 These specified tests and examinations are to be carried out prior to the despatch of finished products from the manufacturer's works.

1.4.5 In the event of any material proving unsatisfactory, during subsequent working, machining or fabrication, it is to be rejected, notwithstanding any previous certification.

1.5 Alternative survey procedure

1.5.1 Where materials are manufactured in quantity by semi-continuous or continuous processes under closely controlled conditions, an alternative system for testing and inspection may be adopted, subject to the agreement of the Surveyors.

1.5.2 In order to be considered for approval, manufacturers are to comply with the requirements of Ch 1,2.

1.6 Post-cure heating

1.6.1 Post-cure heating is to be carried out in properly constructed ovens which are efficiently maintained and have adequate means for control and recording of temperature. The oven is to be such as to allow the whole item to be uniformly heated to the necessary temperature. In the case of very large components which require post-cure heating, alternative methods will be specially considered.

1.7 Test material

1.7.1 Sufficient material is to be provided for the preparation of the test specimens detailed in the specific requirements. It is, however, in the interests of manufacturers to provide additional material for any re-tests which may be necessary, as insufficient or unacceptable test material may be a cause for rejection.

1.7.2 Where test materials, (either base materials or product sample materials) are selected by the Surveyor or a person nominated by LR, these are to be suitably identified by markings which are to be maintained during the preparation of the test specimens.

1.7.3 All base material samples for testing are to be prepared under conditions that are as close as possible to those under which the product is to be manufactured. Where this is not possible, a suitable procedure is to be agreed with the Surveyor.

1.7.4 During production, check test samples are to be provided as requested by the Surveyor.

1.7.5 Should the taking of these samples prove impossible, model samples are to be prepared concurrently with production. The procedure for the preparation of these samples is to be agreed with the Surveyor.

1.7.6 The dimensions, number and orientation of test specimens are to be in accordance with the requirements of a National or International Standard acceptable to LR.

1.8 Re-test procedure

1.8.1 Where test material fails to meet the specified requirement, two additional tests of the same type may be made at the discretion of the Surveyor.

1.8.2 Where an individual test result in a group (minimum five) deviates from the mean by more than two standard deviations in either the higher or lower direction, the result is to be excluded and a re-test made. Excluded results of tests are to be reported with confirmation that they have been excluded. Only one exclusion is acceptable in any group of tests.

1.9 Visual and non-destructive examination

1.9.1 Prior to the final acceptance, surface inspection, verification of dimensions and non-destructive examination are to be carried out in accordance with the requirements detailed in Sections 3, 4 and 5 of this Chapter.

1.9.2 When there is visible evidence to doubt the soundness of any material or component, such as flaws or suspicious surface marks, it is to be the responsibility of the manufacturer to prove the quality of the material by any suitable method.

1.10 Rectification of defective material

1.10.1 Small surface blemishes may be removed by mechanical means provided that, after such treatment, the dimensions are acceptable, the area is proved free from structural defects and the rectification has been completed to the satisfaction of the Surveyor.

1.10.2 Repair procedures for larger defects are to be agreed with LR prior to implementation.

1.11 Identification of products and base materials

1.11.1 The manufacturer of approved materials is to identify each batch with a unique number.

1.11.2 The manufacturer of plastics products is to adopt a system of identification which will enable all finished products to be traced to the original batches of base materials. Surveyors are to be given full facilities for tracing any component or material when required.

1.11.3 When any item has been identified by the personal mark of a Surveyor, or deputy, this is not to be removed until an acceptable new identification mark has been made by a Surveyor. Failure to comply with this condition will render the item liable to rejection.

1.11.4 Before any pipe or fitting is finally accepted it is to be clearly marked by the manufacturer in at least one place with the particulars detailed in the appropriate specific requirements as given in Section 4.

1.11.5 Where a number of identical items are securely fastened together in bundles, the manufacturer need only brand the top item of each bundle. Alternatively, a durable label giving the required particulars may be attached to each bundle.

1.12 Certification

1.12.1 Certification of the finished product is to be in accordance with the requirements of the appropriate Sections.

■ Section 2

Tests on polymers, resins, reinforcements and associated materials

2.1 Scope

2.1.1 This Section gives the tests and data required by LR for materials approval and/or inspection purposes on the following:

- (a) Thermoplastic polymers.
- (b) Thermosetting resins.
- (c) Reinforcements.
- (d) Reinforced thermoplastic polymers.
- (e) Reinforced thermosetting resins.
- (f) Core materials.
 - (i) End-grain balsa.
 - (ii) Rigid foams.
 - (iii) Synthetic felt type materials.
- (g) Machinery chocking compounds.
- (h) Rudder and pintle bearings.
- (j) Stern tube bearings.
- (k) Plywoods.
- (l) Adhesive and sealant materials.
- (m) Repair compounds.

2.2 Thermoplastic polymers

2.2.1 The following data is to be provided by the manufacturer for each thermoplastic polymer:

- (a) Melting point.
- (b) Melt flow index.
- (c) Density.
- (d) Bulk density.
- (e) Filler content, where applicable.
- (f) Pigment content, where applicable.
- (g) Colour.

2.2.2 Samples for testing are to be prepared by moulding or extrusion under the polymer manufacturer's recommended conditions.

2.2.3 The following tests are to be carried out on these samples:

- (a) Tensile stress at yield and break.
- (b) Modulus of elasticity in tension.
- (c) Tensile strain at yield and break.
- (d) Compressive stress at yield and break.
- (e) Compressive modulus.
- (f) Temperature of deflection under load.
- (g) Determination of water absorption.

2.3 Thermosetting resins

2.3.1 The data listed in Table 14.2.1 is to be provided by the manufacturer for each thermosetting resin.

Table 14.2.1 Data requirements for thermosetting resins

Data	Type of resin		
	Polyester (see Note 3 for vinylester)	Epoxide	Phenolic
Specific gravity of liquid resin	required	required	required
Viscosity	required	required	required
Gel time	required	required	not applicable
Appearance	required	required	required
Mineral content (see Note 1)	required	required	not applicable (see Note 2)
Volatile content	required	not applicable	not applicable
Acid value	required	not applicable	not applicable
Epoxide content	not applicable	required	not applicable
Free phenol	not applicable	not applicable	required
Free formaldehyde	not applicable	not applicable	required
NOTES 1. This is to be the total filler in the system, including thixotrope, filler, pigments, etc., and is to be expressed in parts by weight per hundred parts of pure resin. 2. If the resin is pre-filled, the mineral content is required. 3. Vinylesters are to be treated as equivalent to polyesters.			

2.3.2 Cast samples are to be prepared in accordance with the manufacturer's recommendations and are to be cured and post-cured in a manner consistent with the intended use. The curing system used and the ratio of curing agent (or catalyst) to resin are to be recorded. Where post-cure conditions equivalent to ambient-cure conditions apply, see 3.2.2 and 3.2.3.

2.3.3 The following are to be determined using these samples:

- (a) Tensile strength (stress at maximum load) and stress at break.
- (b) Tensile strain at maximum load.
- (c) Tensile secant modulus at 0,5 per cent and 0,25 per cent strain respectively.
- (d) Temperature of deflection under load.
- (e) Barcol hardness.
- (f) Determination of water absorption.
- (g) Volume shrinkage after cure.
- (h) Specific gravity of cast resin.

2.3.4 In addition, for gel coat resins the stress at break and modulus of elasticity in flexure are to be determined.

Plastics Materials

Chapter 14

Section 2

2.4 Reinforcements

2.4.1 The following data is to be provided, where applicable, for each type of reinforcement:

- Reinforcement type.
- Fibre type for each direction.
- Fibre tex value.
- Fibre finish and/or treatment.
- Yarn count in each direction.
- Width of manufactured reinforcement.
- Weight per unit area of manufactured reinforcement.
- Weight per linear metre of manufactured reinforcement.
- Compatibility (e.g. suitable for polyesters, epoxides, etc.).
- Constructional stitching – details of yarn, specific gravity, type, frequency and direction.
- Weave type.
- Binder type and content.
- Density of the fibre material.

2.4.2 Tests of the mechanical properties are to be made on laminate samples containing the reinforcement and prepared as follows:

- an approved resin of suitable type is to be used;
- a minimum of three layers of the reinforcement is to be laid with parallel ply to give a laminate not less than 4 mm thick;
- the weights of resin and reinforcement used are to be recorded together with the measured thickness of the laminate, including the measured weight per unit area of the reinforcement used;
- for glass reinforcements, the glass/resin ratios, by weight, as shown in Table 14.2.2 are to be used;
- for reinforcement type other than glass, a fibre volume fraction, as shown in Table 14.2.3, is to be used.

Table 14.2.2 Glass fraction by weight for different reinforcement types

Reinforcement type	Glass fraction nominal values
Unidirectional	0,60
Chopped strand mat	0,30
Woven roving	0,50
Woven cloth	0,50
Composite roving (see Note)	0,45
Gun rovings	0,33
±45° stitched parallel plied roving	0,50
Triaxial parallel plied roving	0,50
Quadriaxial parallel plied roving	0,50
NOTE Continuous fibre reinforcement with attached chopped strand mat.	

2.4.3 Rovings intended for filament winding are to be tested as unidirectional rovings.

Table 14.2.3 Content by volume for different reinforcement types

Reinforcement type	Content by volume nominal values
Unidirectional	0,41
Chopped strand mat	0,17
Woven roving	0,32
Woven cloth	0,32
Composite roving (see Note)	0,28
Gun rovings	0,19
±45° stitched parallel plied roving	0,32
Triaxial parallel plied roving	0,32
Quadriaxial parallel plied roving	0,32
NOTE The volume content may be converted to weight fractions by use of the formula: $W_F = V_F D_F / (D_F V_F + D_R V_R)$ where W_F = fibre fraction by weight D_F = density of fibre D_R = density of cured resin V_F = fibre fraction by volume V_R = resin fraction by volume	

2.4.4 The following tests as defined in Section 3 are to be made on the samples:

- Tensile strength (stress at maximum load).
- Tensile strain at break.
- Tensile secant modulus at 0,5 per cent and 0,25 per cent strain respectively.
- Compressive strength (stress at maximum load).
- Compressive modulus.
- Flexural strength (stress at maximum load).
- Modulus of elasticity in flexure.
- Apparent interlaminar shear.
- Fibre content.
- Determination of water absorption.

2.4.5 The laminate is to be tested in air in the directions indicated by Table 14.2.4.

Table 14.2.4 Fibre orientations in reinforced test specimens

Type of reinforcement	Test orientations
Unidirectional	0°
Chopped strand mat Gun roving	any direction
Woven roving Woven cloth Composite roving	0° and 90°
± 45° parallel plied roving Triaxial plied roving Quadriaxial plied roving	0°, 45°, 90° and -45°

2.4.6 Additionally, tests in 2.4.4(c) and (f) are to be repeated, in one direction only, after immersion in fresh water at 35°C for 28 days with the exception of 2.4.4(k).

2.5 Reinforced thermoplastic polymers

2.5.1 Thermoplastic polymers intended for use with reinforcements are to be tested in accordance with 2.2.1 to 2.2.3.

2.5.2 A laminate is to be prepared using the polymer and an approved reinforcement in accordance with a manufacturing specification. The laminate is to be tested in accordance with the appropriate requirements of 2.4.4. Testing may be confined to one direction only.

2.6 Reinforced thermosetting resins

2.6.1 Thermosetting resins intended for use with reinforcements are to be tested in accordance with 2.3.1 to 2.3.4.

2.6.2 No further tests are required for gel coat resins.

2.6.3 For laminating resins, a laminate is to be prepared using the resin and an approved reinforcement as follows:

- (a) For polyester resins, chopped strand mat.
- (b) For epoxide resins, a balanced woven roving.
- (c) For phenolic resins, a balanced woven material.

2.6.4 The laminate is to be tested in accordance with 2.4.4 in one fibre direction only.

2.7 Core materials

2.7.1 **General requirements.** The following data is to be provided for each type of core material:

- (a) Type of material.
- (b) Density.
- (c) Description (block, scrim mounted, grooved).
- (d) Thickness and tolerance.
- (e) Sheet/block dimensions.
- (f) Surface treatment.

2.7.2 Manufacturers are required to provide a full application procedure for use of the product.

2.8 Specific requirements for end-grain balsa

2.8.1 The supplier is to provide a signed statement that the balsa (*ochroma lozopus*) is cut to end-grain, is of good quality, being free from unsound or loose knots, holes, splits, rot, pith and corcho, and that it has been treated against fungal and insect attack, shortly after felling, followed by homogenisation, sterilisation and kiln drying to an average moisture content of no more than 12 per cent.

2.8.2 The following tests are to be carried out on the virgin material, both parallel to and perpendicular to the grain:

- (a) Compressive strength (stress at maximum load).
- (b) Compressive modulus of elasticity.
- (c) Tensile strength (stress at maximum load).

The density of the virgin material is also to be tested.

2.8.3 Where the balsa is mounted on a carrier material (e.g. scrim), any adhesive used is to be of a type compatible with the proposed resin system.

2.8.4 Core shear properties are to be determined according to the requirements of 3.8.1.

2.9 Specific requirements for rigid foams (PVC, Polyurethane and other types)

2.9.1 The foam is to be of the closed cell type and compatible with the proposed resin system (e.g. polyester, epoxide, etc.).

2.9.2 Foams are to be of uniform cell structure.

2.9.3 Data is to be provided on the dimensional stability of the foam by measurement of the shrinkage.

2.9.4 The following test data is to be submitted for each type of foam:

- (a) Density.
- (b) Tensile strength (stress at maximum load).
- (c) Tensile modulus of elasticity.
- (d) Compressive strength (stress at maximum load).
- (e) Compressive modulus of elasticity.

2.9.5 Core shear properties are to be determined according to the requirements of 3.8.1.

2.9.6 Additionally, the compressive properties (see 2.9.4(d) and (e)) are to be determined at a minimum of five points over the temperature range ambient to maximum recommended service or 70°C, whichever is the greater.

2.10 Synthetic felt type materials with or without microspheres

2.10.1 For materials of this type, the following data is required in addition to the requirements of 2.7.1:

- (a) Fibre type.
- (b) Width.
- (c) Width of finished material.
- (d) Weight per unit area of the manufactured material.
- (e) Weight per linear metre of the manufactured material.
- (f) Compatibility.
- (g) Details of the method of combining.

2.10.2 A laminate of the material is to be prepared using a suitable approved resin under conditions recommended by the manufacturer.

2.10.3 The following properties are to be determined:

- (a) Tensile strength (stress at maximum load).
- (b) Tensile strain at break.
- (c) Modulus of elasticity in tension or secant modulus at 0,25 per cent and 0,5 per cent strain.
- (d) Compressive strength (stress at maximum load).
- (e) Compressive modulus.
- (f) Flexural strength (stress at maximum load).
- (g) Modulus of elasticity in flexure.
- (h) Fibre content.
- (j) Water absorption.

2.10.4 In the case of anisotropic materials (e.g. where combined with other reinforcements) the tests listed in 2.10.3 are to be conducted in the 0°, 90° directions and in any other reinforcement direction.

2.10.5 Additionally, the tests listed in 2.10.3 are to be repeated after immersion in fresh water at 35°C for 28 days. For anisotropic materials, the requirement is for this test to be carried out in one direction only.

2.10.6 The shear properties (of the resin filled system) are to be determined according to 3.8.1.

2.11 Machinery chocking compounds (resin chocks)

2.11.1 Thermosetting materials for filling the space between the base of machinery and its foundation where the maintenance of accurate alignment is necessary are to be approved by LR before use.

2.11.2 Approval will be considered by LR for use under the following service conditions:

- Loading of 2,5 N/mm² (max) for a temperature not exceeding 60°C.
- Loading of 3,5 N/mm² (max) for a temperature not exceeding 80°C.
- Other loading conditions.

2.11.3 The exotherm temperature, defined as the maximum temperature achieved by the reacting resin under conditions equivalent to those of intended use, is to be determined according to a procedure approved by LR.

2.11.4 The following properties are to be determined on chock material cured at the measured exotherm temperature:

- (a) The impact resistance (Izod).
- (b) Hardness.
- (c) Compressive strength (stress at maximum load) and modulus of elasticity.
- (d) Water absorption.
- (e) Oil absorption.
- (f) Heat deflection temperature.
- (g) Compressive creep is to be measured according to 3.9.4.
- (h) Curing linear shrinkage.
- (j) Flammability.

2.11.5 The chocking compound approval is contingent on the material achieving the minimum exotherm value as specified when used on an installation under practical conditions.

2.11.6 Where the resin chock is to be used for installation of sterntubes and sternbushes in addition to the requirements of 2.11.4, the tensile strength and modulus of elasticity in tension are to be measured.

2.11.7 The manufacturer's installation procedure is required to be documented and is to be to the satisfaction of LR.

2.12 Rudder and pintle bearings

2.12.1 Materials used for rudder and pintle bearings are to be approved by LR before use.

2.12.2 Initial approval is to be based on a review of the following physical properties of the material:

- (a) Compressive strength (stress at maximum load) and modulus of elasticity.
- (b) Tensile strength (stress at maximum load) and modulus of elasticity.
- (c) Shear strength (stress at maximum load).
- (d) Impact strength.
- (e) Swelling in oil and in water.
- (f) Hardness.

2.12.3 Additionally, friction data is to be provided under both wet and dry conditions.

2.12.4 Furthermore, the installation instructions (especially recommended clearances) are to be reviewed by LR prior to provisional approval being given.

2.12.5 If the above data is satisfactory, the material will be provisionally approved until sufficient service experience has been gained.

2.13 Sterntube bearings

2.13.1 Materials used for sterntube bearings are to be approved by LR before use.

2.13.2 Approval is to be based on a review of the physical properties as given by 2.12.2.

2.13.3 Friction data is to be provided under the lubrication system(s) proposed for the material(s).

2.14 Plywoods

2.14.1 All plywoods are to be approved to BS 1088 or equivalent National or International Standard in accordance with LR's Type Approval Procedure.

2.14.2 For structural applications in the marine environment, a minimum timber rating of moderate durability according to BS 1088 is required.

2.14.3 Enhancement of durability by use of preservatives is permitted, subject to each veneer layer being treated with a recognised preservative.

2.14.4 Where Okoume, as specified by BS 1088 is involved, (i.e. non-durable timber classification) this may only be used for marine structures subject to the specific application being acceptable to LR.

2.15 Adhesive and sealant materials

2.15.1 Materials of these types are to be accepted by LR before use.

2.15.2 The requirements for acceptance are dependent on the nature of the application.

2.15.3 In the first instance, the manufacturer is to submit full details of the product, procedure for method of use (including surface preparation) and the intended application. After review of these details, LR will provide a specific test schedule for confirmation of the material's properties.

2.15.4 Any acceptance granted will be limited to specific applications and will be contingent on the instructions for use being adhered to.

2.16 Repair compounds

2.16.1 Materials used for repairs are to be accepted by LR before use.

2.16.2 For acceptance purposes, the manufacturer is to submit full product details, and user instructions, listing the types of repair for which the system is to be used together with details of any installer accreditation schemes.

2.16.3 Dependent on the proposed uses, LR may require testing in accordance with a specified test programme.

2.16.4 Materials will not be accepted for the following uses unless specific evidence of their suitability is provided:

- (a) Any component in rubbing contact.
- (b) Any component subject to dynamic cyclic loading.
- (c) Any pressure part in contact with gas or vapour.
- (d) Any pressure part in contact with liquid above 3,5 bar.
- (e) Any component where operating temperature exceeds 90°C.

All uses of materials of these types are subject to the discretion of the Surveyor.

Section 3

Testing procedures

3.1 General

3.1.1 This Section gives details of the test methods to be used for base materials and on finished plastics products such as fibre reinforced plastics (FRP) piping and any testing required in the construction of composite vessels.

3.1.2 In general, testing is to be carried out by a competent independent test house which, at the discretion of LR, may or may not require witnessing by the Surveyor.

3.1.3 Alternatively, testing may be carried out by the manufacturer subject to these tests being witnessed by the Surveyor.

3.1.4 All testing is to be carried out by competent personnel.

3.1.5 Unless specified otherwise, testing is to be carried out in accordance with a recognised ISO Standard, where one exists, and all test programmes are to have written procedures.

3.1.6 Alternatively, testing may be carried out in accordance with a National Standard provided that it conforms closely to an appropriate ISO standard and subject to prior agreement with the Surveyor.

3.1.7 Mechanical properties are to be established using suitable testing machines of approved types. The machines and other test equipment are to be maintained in a satisfactory and accurate condition and are to be recalibrated at approximately annual intervals. Calibration is to be undertaken by a nationally recognised authority or other organisation of standing and is to be to the satisfaction of the Surveyor. A record of all calibrations is to be kept available in the test house. The accuracy of test machines is to be within \pm one per cent.

3.2 Preparation of test samples

3.2.1 Thermoplastic samples are to be prepared in accordance with the manufacturer's recommendations for moulding. For finished products, samples are to be taken from the product during production in accordance with the manufacturer's quality plan, but where this is impractical, separate test samples are to be prepared in a manner identical with that of the product.

3.2.2 Samples of thermosetting resins are to be prepared using the curing system recommended by the manufacturer and identical with that used for the finished product.

3.2.3 The post curing conditions for samples of thermosetting resins are to be as recommended by the manufacturer and identical with those used for the finished product. Where the samples are made for the general approval of a resin, the post curing conditions are to be those in which the resin is intended to be used.

3.2.4 Where curing of the product is intended to take place at room temperature, the sample is to be allowed to cure at room temperature (18 to 21°C) for 24 hours followed by a post-cure at 40°C for 16 hours.

3.2.5 Where a reinforcement is to be used, the ratio of reinforcement to resin or polymer is to be nominally the same as that of the finished product or in accordance with Table 14.2.2 or 14.2.3.

3.2.6 Where laminates are prepared specifically for approval test purposes, the reinforcement is to be laid parallel plied.

3.3 Preparation of test specimens

3.3.1 The test specimen is to be prepared in accordance with the appropriate ISO standard and the requirements of this Section.

3.3.2 Precautions are to be taken during machining to ensure that the temperature rise in the specimen is kept to a minimum.

3.4 Testing

3.4.1 Strain measurement is to be made by the use of a suitable extensometer or strain gauge.

3.4.2 The rate of strain is to be in accordance with the appropriate ISO standard.

3.4.3 The number of test specimens from each sample to be tested is to be in accordance with the ISO standard. For mechanical testing this is five.

3.5 Discarding of test specimens

3.5.1 If a test specimen fails because of faulty preparation or incorrect operation of the testing machine, it is to be discarded and replaced by a new specimen.

3.5.2 In addition, if the deviation of one result in a group of five exceeds the mean by more than two standard deviations, that result is to be discarded and one further specimen tested, see 1.8.1 and 1.8.2.

3.6 Reporting of results

3.6.1 All load/displacement graphs and tabulated results are to be reported, including mean values and the calculated standard deviation.

3.6.2 Additionally, full details of the sample and specimen preparation are to be provided including (where applicable):

- Catalyst/accelerator or curing agent types and mix ratio.
- Weights of resins, and/or reinforcements used.
- Casting/laminate dimensions.
- Number of layers of reinforcement used.
- Curing/post-curing conditions.

3.7 Tests for specific materials

3.7.1 The data requirements in 2.2 and 2.3 for thermoplastic or thermosetting resins or polymers are to be determined in accordance with suitable National or International Standards.

3.7.2 Recognised Standards to which specimens of unreinforced thermoplastic resins are to be tested are listed in Table 14.3.1.

Table 14.3.1 Tests for unreinforced thermoplastic resins

Test	Standard	
Tensile properties	ISO 527-2	Test speed = 5 mm/min Specimen 1A or 1B
Flexural properties	ISO 178	Test speed = $\frac{\text{Thickness}}{2}$ mm/min
Water absorption	ISO 62	Method 1
Temperature of deflection under load	ISO 75-2	Method A
Compressive properties	ISO 604	Test speed – as for ductile materials
NOTES 1. Water absorption – result to be expressed as milligrams. 2. Tensile modulus values are to be determined using an extensometer which may be removed for strain to failure.		

3.7.3 Test standards for unreinforced cast thermosetting resins are given in Table 14.3.2.

Table 14.3.2 Tests on unreinforced cast thermoset resin specimens

Test	Standard	
Tensile properties	ISO 527-2	Test speed = 5 mm/min Specimen 1A or 1B
Flexural properties	ISO 178	Test speed = $\frac{\text{Thickness}}{2}$ mm/min
Water absorption	ISO 62	Method 1
Temperature of deflection under load	ISO 75-2	Method A
Compressive properties	ISO 604	Test speed = 1 mm/min
NOTES 1. ISO 62 – where resins are intended for use under ambient conditions to avoid additional post-curing, the requirement in ISO 62 for pre-drying the test specimen at 50°C is to be omitted. The test result is to be expressed as mg of water. 2. ISO 527-2 – tensile properties are to be measured using extensometry.		

3.7.4 The Standards to which laminate specimens of any type are to be tested are listed in Table 14.3.3.

Table 14.3.3 Tests on laminate specimens

Test	Standard	
Tensile properties	ISO 527-4	Test speed = 2 mm/min Specimens Types II or III
Flexural properties	ISO 14125	Test speed = $\frac{\text{Thickness}}{2}$ mm/min Method A
Compressive properties	ISO 604	Test speed = 1 mm/min
Interlaminar shear	ISO 14130	
Water absorption	ISO 62	Method 1
Glass content	ISO 1172	
NOTES 1. ISO 62 – where resins are intended for use under ambient conditions to avoid additional post-curing, the requirement in ISO 62 for pre-drying the test specimen at 50°C is to be omitted. The test result is to be expressed as mg of water. 2. ISO 527-4 – tensile properties are to be measured using extensometry. 3. Tensile modulus values are to be determined using an extensometer which may be removed for strain to failure.		

3.8 Structural core materials

3.8.1 Initially, the core shear strength and modulus are to be determined by ISO 1922–1981 or ASTM C273. Test sandwich panels are then to be prepared and subjected to four-point flexural tests to determine the apparent shear properties according to ASTM C393 (short beam) at two representative thicknesses (i.e. 15 mm and 30 mm). Testing is to be carried out at ambient temperature and at 70°C. The following requirements are to be observed:

- Each skin is to be identical and have a thickness not greater than 21 per cent of the nominal core thickness. For hand laid constructions, each skin is to comprise a lightweight chopped strand mat reinforcement (300 g/m²) consolidated at a glass content, by weight, of 0.3 against the core, plus the required number of woven reinforcements consolidated, using an isophthalic polyester resin, to give a minimum glass content, by weight, of 0.5.
- The method of construction of the sandwich laminate is to reflect the core material manufacturer's instructions for use, i.e. application of bonding paste, surface primer or any other recommended system.
- Where vacuum bagging techniques or equivalent systems are used, these will be subject to individual consideration.
- All resins and reinforcements are to hold current LR approval.
- Curing conditions are to be in accordance with 3.2.3 and 3.2.4.

- The dimensions of the test samples should be based on the requirements of ASTM C393 Paragraph 5.1, and the ratio parameters as indicated in ASTM C393 Paragraph 5.2, using a proportional limit stress (F) for the woven roving skins of 130 N/mm² and a span (a_2) of not less than 400 mm.

3.8.2 For each type of test sample, the following data are to be reported, together with the submission of a representative test sample showing the mode of failure for each density of core material:

- Skin and core thickness, and core type and density.
- Resin/catalyst/accelerator ratio.
- Skin construction, including types and weight of reinforcements, resin(s), etc.
- Details of production method and curing conditions (temperature and times).
- Where additional preparation of the foam is involved, for example the use of primers or bonding pastes, full details are to be provided.
- Actual span between base supports for each type of test sample.

3.8.3 The following requirements apply to end-grain balsa:

- The data requirements of 2.7.1 are to be provided, where applicable, according to suitable National or International Standards.
- The balsa is to be tested according to the requirements of 3.8.1.
- The test methods for balsa are given in Table 14.3.4.

Table 14.3.4 Tests on end-grain balsa

Test	Standard
Density	ISO 845-1977
Tensile properties	ASTM C297-61
	Test speed = $\frac{\text{Thickness}}{10}$ mm/min
Compressive properties	ISO 844-1978
	Test speed = $\frac{\text{Thickness}}{10}$ mm/min
Shear properties	ISO 1922-1981 Test speed = 1mm/min

3.8.4 The following requirements apply to rigid foams:

- The data requirements of 2.7.1 are to be provided in accordance with a suitable National or International Standard.
- The foam is to be tested according to the requirements of 3.8.1.
- The test methods for rigid foams are to be in accordance with Table 14.3.4.

3.8.5 The following requirements apply to synthetic felt type materials:

- (a) The data requirements of 2.10.1 are to be provided according to suitable National or International Standards.
- (b) The material is to be tested according to the requirements of 3.8.1, with the following modifications:
 - (i) The core of the laminate test sandwich panel is to be prepared with a fibre content as recommended by the manufacturer.
 - (ii) The felt fibre/resin ratio is to be stated.
 - (iii) The required test thicknesses of the cores are to be changed from 30 mm and 15 mm to 12 mm and 6 mm respectively.
- (c) The prepared laminate of the base material is to be of minimum thickness 3,5 mm with a minimum of three layers.
- (d) The specified tests on the laminate (see 2.10.3) are to be conducted according to the requirements of Table 14.3.3.

3.9 Machinery chocking compounds

3.9.1 Test samples of the cured chock resin are to be prepared under ambient conditions and then post-cured at the exotherm temperature as determined in 2.11.3.

3.9.2 The specified properties are to be determined as required by Table 14.3.5.

Table 14.3.5 Tests for machinery chocking compounds

Test	Standard
Izod Impact Resistance	ISO 180-1993 Unnotched
Barcol hardness	EN 59
Compressive strength	ISO 604 Test speed = 1 mm/min
Water absorption	ISO 62 Method 1 25 mm x 20 mm cylinder (to constant weight)
Oil absorption (light machine)	ISO 175 25 mm x 20 mm cylinder (to constant weight)
Temperature of deflection under load	ISO 75-2 Method A

3.9.3 The percentage linear shrinkage of cured material is to be measured.

3.9.4 Creep is to be measured according to the following method:

- (a) A 25 mm x 20 mm diameter parallel faced cylinder is to be pre-loaded against a steel base at 2,5 N/mm² or 3,5 N/mm², or at the specified higher loading condition, at ambient temperature for 16 hours.
- (b) The temperature is to be increased at the rate of 8°C per hour until the service temperature (60°C or 80°C) is reached.

- (c) During this time, the creep of the cylinder is to be measured at 15 minute intervals.
- (d) The temperature and loading are to be maintained for a minimum of 100 days measuring the creep at intervals of 24 hours.
- (e) A plot of creep in mm (linear scale) against time (log scale), together with full experimental details, is to be provided for review by LR.

3.10 Rudder and pintle bearings

3.10.1 All mechanical properties as required by 2.12 are to be measured according to suitable National or International Standards.

3.10.2 Frictional properties are to be determined according to a method agreed with LR.

3.11 Sterntube bearings

3.11.1 The requirements for sterntube bearings are as defined in 2.13.

Section 4 Plastics pipes and fittings

4.1 Scope

4.1.1 This Section gives the general requirements for plastics pipes and fittings, with or without reinforcement, intended for use in the services listed in the relevant Rules dealing with design and construction. Hoses and mechanical couplings are not covered by these requirements.

4.1.2 Pipes and fittings intended for application in Class I, Class II and Class III systems for which there are Rule requirements, are to be manufactured in accordance with the requirements of Section 1 and this Section.

4.1.3 As an alternative to 4.1.2, plastics pipes and fittings which comply with National or proprietary specifications may be accepted, provided that the specifications give reasonable equivalence to the requirements of this Section or, alternatively, are approved for a specific application. The survey and certification are however to be carried out in accordance with the requirements of this Section.

4.2 Design requirements

4.2.1 The requirements for design approval are detailed in the relevant Rules.

4.2.2 The design submission is to include a materials list with confirmation that the materials listed have properties and characteristics conforming with those values used in the design submission. As a minimum, the details given should include the following:

- (a) Resin.
- (b) Accelerator (type and concentration).
- (c) Catalyst or curing agent (type and concentration).
- (d) Reinforcement.
- (e) Cure/post-cure conditions.
- (f) Resin/reinforcement ratio.
- (g) Wind angle (or lay-up sequence) and orientation.
- (h) Dimensions and tolerances.

This submission is to include similar details for the fittings together with a description of the method of attachment of the fittings to the pipes.

4.2.3 Any alteration of the component materials or manufacturing operations from those used in the design submission will necessitate a completely new submission.

4.2.4 If the piping manufacturer anticipates the possible use of alternative materials, these should be listed in the design submission. Proof that the modified product will meet the specified requirements will be needed prior to its use.

4.3 Manufacture

4.3.1 Plastics pipes and fittings intended for use in Class I, Class II and Class III systems are to be manufactured at facilities approved by LR, using materials approved by LR.

4.3.2 A Manufacturing Specification is to be submitted. This is to contain details of the following:

- (a) All constituent materials.
- (b) Manufacturing procedures such as lay-up sequence or wind angle, the ratios of curing agent to resin and reinforcement to resin, the laminate thickness, the mandrel dwell time (initial cure) and the cure and post-cure conditions.
- (c) Quality control procedures including details and frequency of tests on the incoming materials, tests made during production and on the finished piping.
- (d) Acceptance standards and tolerances, including all dimensions.
- (e) Procedures for cosmetic repair.
- (f) System for traceability of the finished piping to the batches of raw materials.
- (g) Method of bonding pipes and fittings.

4.3.3 Details of all raw materials are to be submitted for approval and are to be in accordance with the Manufacturing Specification and the design submission.

4.3.4 All batches of raw materials are to be provided with unique identifications by their manufacturers.

4.3.5 No batch of material is to be used later than its date of expiry.

4.3.6 The piping manufacturer is to ensure that all batches of materials are used sequentially.

4.3.7 The piping manufacturer is to maintain records of the amounts of resin and reinforcement used, in order to ensure that the proportions remain within the limits set in the Manufacturing Specification.

4.3.8 Records are to be kept of the wind angle and/or the orientation of the reinforcement.

4.3.9 The piping manufacturer is to ensure that each item of piping is traceable to the batch or batches of material used in its manufacture. The unique identifications referred to in 4.3.4 are to be included on all documents.

4.3.10 The curing oven is to be suitable for the intended purpose and all pyrometric equipment is to be calibrated at least annually and adequate records maintained.

4.3.11 The temperature of the pipe or fitting is to be controlled and recorded by the attachment of suitably placed thermocouples.

4.4 Quality assurance

4.4.1 The piping manufacturer is to have a quality assurance system approved to ISO 9001 or equivalent. This system should ensure that the pipes and fittings are produced with uniform and consistent mechanical and physical properties in accordance with acceptable standards.

4.5 Dimensional tolerances

4.5.1 Dimensions and tolerances are to conform to the Manufacturing Specification.

4.5.2 The wall thicknesses of the pipes are to be measured at intervals around the circumference and along the length in accordance with an appropriate National Standard. The thicknesses are to accord with the Manufacturing Specification.

4.5.3 The responsibility for maintaining the required tolerances and making the necessary measurements rests with the manufacturer. Occasional checking by the Surveyor does not absolve the manufacturer from this responsibility.

4.6 Composition

4.6.1 The composition of the pipes and fittings is to be in accordance with the Manufacturing Specification.

4.6.2 Where alternative materials are used (see 4.2.4), the manufacturer is to demonstrate to the Surveyor's satisfaction, and prior to their introduction, their suitability with respect to the performance of the piping. Otherwise, full testing as specified in 4.7 will be required.

4.7 Testing

4.7.1 For thermoplastic pipes, the polymer manufacturer is to make the following measurements on samples taken from each batch:

- (a) Melting point.
- (b) Melt flow index.
- (c) Density.
- (d) Filler/pigment content, where applicable.
- (e) Tensile stress at yield and break.
- (f) Tensile strain at yield and break.

4.7.2 The values obtained are to be certified by the polymer manufacturer.

4.7.3 For reinforced thermoset pipes, the resin manufacturer is to determine, on samples taken from each batch, at least the following:

- (a) All resins:
 - (i) Viscosity.
 - (ii) Gel time.
 - (iii) Filler content, where applicable.
- (b) Polyester resins:
 - (i) Type (orthophthalic, isophthalic, etc.).
 - (ii) Volatiles content.
 - (iii) Acid value.
- (c) Epoxide resins:
 - (i) Free epoxide content.
- (d) Phenolic resins:
 - (i) Free phenol content.
 - (ii) Free formaldehyde content.

4.7.4 The values obtained are to comply with the requirements of the Manufacturing Specification.

4.7.5 Where the resin manufacturer mixes batches, both the original batches and the mixed batch are to be tested in accordance with 4.7.1 to 4.7.3 as appropriate. The mixed batch is then to be given a unique batch number.

4.7.6 The polymer or resin manufacturer is to demonstrate that each batch of polymer or resin satisfies the requirement for temperature of deflection under load and this is not to be less than 80°C.

4.7.7 These measurements should be repeated on each batch by the piping manufacturer. Where this is not done, LR may require that the tests be made on a random basis by an independent laboratory.

4.7.8 The piping manufacturer is to confirm, by means of tests on at least one batch in twenty, that the temperature of deflection under load exceeds the specified minimum under manufacturing conditions.

4.7.9 Where reinforcements are used, at least the following are to be recorded, where applicable:

- (a) Tex of yarn(s) or roving(s).
- (b) Ends per 100 mm in all reinforcement orientations.
- (c) Weight per square metre.
- (d) Binder/size content.
- (e) Stitch type and count.
- (f) Type of fibre used.
- (g) Surface treatment and/or finish.

4.7.10 All items in 4.7.9 are to comply with the Manufacturing Specification.

4.7.11 The piping manufacturer is to maintain accurate records of resin and glass usage and is to calculate the resin/glass ratio on an ongoing basis.

4.7.12 During manufacture of the piping, apart from the requirements of 4.7.5, 4.7.6 and 4.7.8, tests are to be carried out on the constituents and final product in accordance with Table 14.4.1.

Table 14.4.1 Testing during manufacture of pipes

Component/ operation	Characteristic	Rate of testing
Resin/curing agent/catalyst	Gel time Rate of consumption	Two per shift Continuous
Reinforcement	Quality Wind angle Rate of consumption	Continuous Continuous Continuous
Resin/ reinforcement	Ratio	Continuous
Pipe	Post-cure: temperature of the pipe in oven	Continuous
	Cure level	At least eight per length
	Dimensions	Each length
	Hydraulic pressure test	Each length
	Electrical resistance	Each length (see Note)
	Hydraulic bursting test	At Surveyor's discretion
	Axial strength	At Surveyor's discretion
NOTE Measurements of electrical resistance are only required on piping where the operating conditions given in Pt 5, Ch 12,5.2.4 of the Rules and Regulations of the Classification of Ships apply.		

4.7.13 The standards of acceptance are those listed in the Manufacturing Specification approved by LR.

4.7.14 At the Surveyor's discretion, sections of pipe are to be subjected to hydraulic bursting tests and/or measurements of axial strength.

4.7.15 If the batch of resin or polymer, or the curing agent, or their ratio is changed during manufacture of a batch of pipes, at least two additional measurements of the gel time are to be carried out during each shift.

4.8 Visual examination

4.8.1 All pipes and fittings are to be visually examined and are to be free from surface defects and blemishes.

4.8.2 The pipes are to be reasonably straight and the cut ends are to be square to the axis of the pipe.

4.9 Hydraulic test

4.9.1 Each length of pipe is to be tested at a hydrostatic pressure not less than 1,5 times the rated pressure of the pipe.

4.9.2 The test pressure is to be maintained for sufficient time to permit proof and inspection. Unless otherwise agreed, the manufacturer's certificate of satisfactory hydraulic test, endorsed by the Surveyor, will be accepted.

4.10 Repair procedure

4.10.1 Repairs are not allowed, with the exception of minor cosmetic blemishes as detailed in 1.10.1.

4.10.2 A repair procedure for these minor blemishes is to be included in the Manufacturing Specification.

4.11 Identification

4.11.1 All piping is to be identified in such a manner that traceability to all the component materials used in its manufacture is ensured. The Surveyor is to be given full facilities for tracing the material when required.

4.11.2 Pipes and fittings are to be permanently marked by the manufacturer by moulding, hot stamping or by any other suitable method, such as printing, in accordance with 1.11. The markings are to include:

- (a) Identification number, see 4.11.1.
- (b) LR or Lloyd's Register, and the abbreviated name of LR's local office.
- (c) Manufacturer's name or trademark.
- (d) Pressure rating.
- (e) Design standard.
- (f) Material system with which the piping is made.
- (g) Maximum service temperature.

4.12 Certification

4.12.1 The manufacturer is to provide the Surveyor with copies of the test certificates or shipping statements for all material which has been accepted.

4.12.2 Each test certificate is to contain the following particulars:

- (a) Purchaser's name and order number.
- (b) If known, the contract number for which the piping is intended.
- (c) Address to which piping is despatched.
- (d) Type and specification of material.

- (e) Description and dimensions.
- (f) Identification number, see 4.11.1.
- (g) Test results.

Section 5 Control of material quality for composite construction

5.1 Scope

5.1.1 This Section gives the general requirements for control of material quality when used in the construction of composite craft.

5.1.2 For composite craft built under the Rules, the survey of materials is to be conducted in accordance with the requirements of Sections 1 to 3 and this Section.

5.2 Design submission

5.2.1 The requirements for design submission are detailed in the appropriate Part of the Rules which includes full information on composite materials.

5.3 Construction

5.3.1 All constructions are to be carried out using materials approved or accepted by LR.

5.3.2 All materials are to be in accordance with the approved construction documentation.

5.3.3 All batches of materials are to be provided with unique identifications by their manufacturers. Components are to be similarly identified.

5.3.4 No batch of material is to be used later than its date of expiry.

5.3.5 The Builder is to ensure that all batches of materials are used systematically and sequentially.

5.3.6 The Builder is to maintain, on a continuous basis, records of the amounts of resin and reinforcement used, in order to ensure that the proportions remain within the limits set in the construction documentation.

5.3.7 Records are to be kept of the sequence and orientation of the reinforcements.

5.3.8 The Builder is to ensure that each section of the construction is traceable to the batch or batches of material used. The unique identifications required under 1.11.1 are to be included on all relevant quality control documentation.

5.3.9 Any curing system used is to be demonstrated as suitable for the intended purpose and all pyrometric equipment is to be calibrated at least annually and adequate records maintained.

5.3.10 The post-curing temperature is to be controlled and recorded by the attachment of suitably placed thermocouples.

5.4 Quality assurance

5.4.1 Where the Builder has a quality assurance system, this is to include the requirements of this Section.

5.5 Dimensional tolerances

5.5.1 Dimensions and tolerances are to conform to the approved construction documentation.

5.5.2 The thicknesses of the laminates are, in general, to be measured at not less than ten points, evenly distributed across the surface. In the case of large sections, at least ten evenly distributed measurements are to be taken in bands across the width at maximum spacing of two metres along the length.

5.5.3 The responsibility for maintaining the required tolerances and making the necessary measurements rests with the Builder. Monitoring and random checking by the Surveyor does not absolve the Builder from this responsibility.

5.5.4 Where ultrasonic thickness gauges are used, these are to be calibrated against an identical laminate (of measured thickness) to that on which the thickness measurement is to be carried out. If suitable pieces are not available from the construction, then a small sample of identical lay-up is to be prepared.

5.6 Material composition

5.6.1 The materials, prefabricated sections or components used are to be in accordance with the approved construction documentation.

5.6.2 Where alternative materials are used, these are to be of approved or accepted types and the manufacturer is to demonstrate to the Surveyor's satisfaction, prior to their introduction, their suitability with respect to performance, otherwise full testing as appropriate will be required.

5.7 Material testing

5.7.1 Where so required, the material manufacturer is to provide the purchaser with certificates of conformity for each batch of material supplied, indicating the relevant values specified in 5.7.4 to 5.7.8. These values are to comply with those specified by the approved construction documentation.

5.7.2 Where the Builders do not conduct verification testing of the information indicated in 5.7.4 to 5.7.8, they are to ensure that copies of all certificates of conformity (which must indicate the actual tested values) are obtained for all batches of materials received, and maintain accurate records. The Surveyor may at any time select a sample of a material for testing by an independent, where applicable, source and should such tests result in the material failing to meet the specification, then that batch will be rejected.

5.7.3 The following tests are to be carried out, where applicable, on receipt of any material:

- (a) The consignment is to be divided into its respective batches and each batch is to be labelled accordingly.
- (b) Each batch is to be visually examined for conformity with the batch number, visual quality and date of expiry.
- (c) Each batch is to be separately labelled and stored separately.
- (d) Each unit, within the batch, is to be labelled with the batch number.
- (e) Records are to be maintained of the above and these are to be cross-referenced with the certificate of conformity for the material and/or the Builder's own test results.

5.7.4 For thermosetting resins, reinforced or otherwise, the resin manufacturer is to have determined, on samples taken from each batch, at least the following:

- (a) All resins:
 - (i) Viscosity.
 - (ii) Gel time.
 - (iii) Filler content, where applicable.
- (b) Polyester and vinylester resins:
 - (i) Type (orthophthalic, isophthalic, etc.).
 - (ii) Volatiles content.
 - (iii) Acid value.
- (c) Epoxide resins:
 - (i) Free epoxide content.
- (d) Phenolic resins:
 - (i) Free phenol content.
 - (ii) Free formaldehyde content.

5.7.5 For thermoplastics, the polymer manufacturer is to have made the following measurements on samples taken from each batch:

- (a) Melting point.
- (b) Melt flow index.
- (c) Density.
- (d) Filler/pigment content, where applicable.
- (e) Tensile stress at yield and break.
- (f) Tensile strain at yield and break.

5.7.6 Where the resin or polymer manufacturer mixes batches, both the original batches and the mixed batch are to be tested in accordance with 5.7.4 or 5.7.5 as appropriate. The mixed batch is then to be given a unique batch number.

5.7.7 For reinforcements, the material manufacturer is to have recorded, where applicable, the following for each batch of material:

- (a) Tex of yarn(s) or roving(s).
- (b) Ends per 100 mm in all reinforcement orientations.
- (c) Weight per square metre.
- (d) Binder/size content.

- (e) Stitch type and count.
- (f) Type of fibre used.
- (g) Surface treatment and/or finish.

5.7.8 For core materials, the following properties are to be recorded by the manufacturer for each batch:

- (a) Type of material.
- (b) Density.
- (c) Description (block, scrim mounted, grooved).
- (d) Thickness and tolerance.
- (e) Sheet/block dimensions.
- (f) Surface treatment.

Together with the following mechanical properties:

In the case of rigid foams:

- (g) Compressive strength (stress at maximum load) and modulus of elasticity.
- (h) Core shear strength.

In the case of end-grain balsa:

- (j) Tensile strength (stress at maximum load).
- (k) Compressive strength (stress at maximum load) and modulus of elasticity.

5.7.9 During construction, tests are to be carried out on the constituents and final product in accordance with Table 14.5.1.

5.7.10 The standards of acceptance for testing are those listed in the material manufacturer's specification, approved construction documentation or agreed quality control procedures as applicable.

5.7.11 Laminate fibre content is to be determined at the request of the Surveyor, in particular where the thickness measured does not correlate with the specified fibre content, by weight. This will, in general, result in additional reinforcement being required.

5.7.12 If the batch of resin or polymer, or the curing agent, or their ratio is changed, at least two additional measurements of the gel time are to be carried out during each shift.

5.8 Visual examination

5.8.1 All constructional mouldings and any components are to be visually examined and are to be free from surface defects and blemishes.

5.9 Repair procedure

5.9.1 Repairs of minor cosmetic blemishes are permitted providing that these are brought to the attention of the Surveyor.

5.9.2 A repair procedure for these minor blemishes is to be included in the agreed quality control procedures.

5.9.3 Structural repairs are subject to individual consideration and full written details must be approved by the plan approval office prior to introduction.

5.10 Material identification

5.10.1 Records of the construction are to be kept in such a manner that traceability of all the component materials used is ensured. The Surveyor is to be given full facilities for tracing the material's origin when required.

5.10.2 Small representative samples of each batch of material are to be retained, these being suitably labelled to ensure traceability.

5.10.3 When so requested by the Surveyor, the Builder is to provide copies of all test data and/or manufacturers' certificates of conformity appertaining to any material used.

Table 14.5.1 Testing during construction

Component/operation	Characteristic	Rate of testing
Resin/curing agent/catalyst	Gel time Rate of consumption	Two per shift Continuous
Reinforcement	Quality Orientation Rate of consumption	Continuous Continuous Continuous
Resin/reinforcement	Ratio	Continuous
Construction	Temperature during cure/post cure Dimensions Cure level (Barcol) against resin manufacturer's specification Laminate thickness Laminate fibre content	Continuous Continuous against approved construction documentation At least one per square metre Continuous against material usage and approved construction documentation (see also 5.5.2 to 5.5.4) At the Surveyor's request (see 5.7.11)

5.11 Minimum tested requirements for material approval

5.11.1 This Section provides the minimum property values required of a material for approval or acceptance by LR and are applicable to materials cured under ambient conditions.

5.11.2 **Gel coat resins.** When the cast resin is tested according to the requirements of 2.3, Table 14.5.2 gives the minimum values for the respective properties.

Table 14.5.2 Gel coat resins, minimum property values

Properties	Minimum value
Tensile strength (stress at maximum load)	40 N/mm ²
Tensile stress at break	40 N/mm ²
Tensile strain at maximum load	2,5%
Modulus of elasticity in tension	As measured
Flexural strength (stress at maximum load)	80 N/mm ²
Modulus of elasticity in flexure	As measured
Barcol hardness	As measured at full cure
Water absorption	70 mg (max)
Specific gravity of cast resin	As measured

5.11.3 **Laminating resins.** When tested according to the requirements of 2.3 and 2.4, Tables 14.5.3 and 14.5.4 give the minimum properties for the cast resin and chopped strand mat laminate respectively.

Table 14.5.3 Laminating resins, minimum property values

Properties	Minimum value
Tensile strength (stress at maximum load)	40 N/mm ²
Tensile stress at break	40 N/mm ²
Tensile strain at maximum load	2,0%
Modulus of elasticity in tension	As measured
Flexural strength (stress at maximum load)	70 N/mm ²
Modulus of elasticity in flexure	As measured
Barcol hardness	As measured at full cure
Temperature of deflection under load	55°C
Specific gravity of cast resin	As measured
NOTE These minimum values are for the recommended glass content by weight of 0,3.	

Table 14.5.4 Laminating resins, minimum values for properties for CSM laminate at 0,3 glass fraction by weight

Properties	Minimum value
Tensile strength (stress at maximum load)	90 N/mm ²
Secant modulus at 0,25% and 0,5% strain respectively	6,9 kN/mm ²
Compressive strength (stress at maximum load)	125 N/mm ²
Compressive modulus	6,4 kN/mm ²
Flexural strength (stress at maximum load)	160 N/mm ²
Modulus of elasticity in flexure	5,7 kN/mm ²
Apparent interlaminar shear strength (see Note)	18 N/mm ²
Fibre content	As measured (0,3)
Water absorption	70 mg (max)
NOTE Applicable only to the special test for environmental control resins.	

5.11.4 When tested to the requirements of 2.4 for reinforcements, Table 14.5.5 gives the minimum properties for laminates.

5.11.5 Alternatively, materials may be approved by use of the actual tested values whereby the approval value shall equal the mean of the tested values minus twice the standard deviation of a minimum of five tested values.

5.12 Closed cell foams for core construction based on PVC or polyurethane

5.12.1 Table 14.5.6 gives minimum values for closed cell forms for core construction based on PVC or polyurethane.

5.12.2 Other types of foam will be subjected to individual consideration. A minimum core shear strength of 0,5 N/mm² is to be achieved.

5.13 End-grain balsa

5.13.1 Table 14.5.7 gives the minimum property requirement for end-grain balsa.

5.14 Other materials

5.14.1 All other materials will be subject to special consideration.

Table 14.5.5 Laminates, minimum property requirements

Material type	Property	Value
Chopped strand mat	Tensile strength (stress at maximum load) (N/mm ²)	$200G_c + 25$
	Modulus of elasticity in tension (kN/mm ²)	$15G_c + 2,0$
Bi-directional reinforcement	Tensile strength (stress at maximum load) (N/mm ²)	$400G_c - 10$
	Modulus of elasticity in tension (kN/mm ²)	$30G_c - 0,5$
Uni-directional reinforcement	Tensile strength (stress at maximum load) (N/mm ²)	$1800G_c^2 - 1400G_c + 510$
	Modulus of elasticity in tension (kN/mm ²)	$130G_c^2 - 114G_c + 39$
All	Flexural strength (stress at maximum load) (N/mm ²)	$502G_c^2 + 106,8$
	Modulus of elasticity in flexure (kN/mm ²)	$33,4G_c^2 + 2,2$
	Compressive strength (stress at maximum load) (N/mm ²)	$150G_c + 72$
	Compressive modulus (kN/mm ²)	$40G_c - 6$
	Interlaminar shear strength (N/mm ²)	$22 - 13,5G_c$ (min 15)
	Water absorption (mg)	70 (maximum)
	Glass content (% by weight)	As measured
NOTES 1. After water immersion, the values shall be a minimum of 75% of the above. 2. Where materials have reinforcement in more than two directions, the requirement will be subject to individual consideration dependent on the construction. 3. G_c = glass fraction by weight.		

Table 14.5.6 Minimum characteristics and mechanical properties of rigid expanded foams at 20°C

Material	Apparent density kg/m ³	Strength (stress at maximum load) (N/mm ²)			Modulus of elasticity (N/mm ²)	
		Tensile	Compressive	Shear	Compressive	Shear
Polyurethane	96	0,85	0,60	0,50	17,20	8,50
Polyvinylchloride	60					

Table 14.5.7 Minimum characteristics and mechanical properties of end-grain balsa

Apparent density (kg/m ³)	Strength (stress at maximum load) (N/mm ²)					Compressive modulus of elasticity (N/mm ²)		Shear modulus of elasticity (N/mm ²)
	Compressive		Tensile		Shear			
	Direction of stress					Direction of stress		
	Parallel to grain	Perpendicular to grain	Parallel to grain	Perpendicular to grain		Parallel to grain	Perpendicular to grain	
96	5,0	0,35	9,00	0,44	1,10	2300	35,2	105
144	10,6	0,57	14,6	0,70	1,64	3900	67,8	129
176	12,8	0,68	20,5	0,80	2,00	5300	89,6	145

■ *Section 1*
Rules application

1.1 General

1.1.1 The Rules apply in general to ships of normal form, proportions and speed. Although the Rules are, in general, for steel ships of all welded construction, other materials for use in the construction will be considered.

1.2 Exceptions

1.2.1 Ships of unusual form, proportions or speed, or for special or restricted service, or purposes not covered specifically by the Rules, will receive individual consideration based on the general standards of the Rules.

1.3 Loading

1.3.1 The Rules are framed on the understanding that ships will be properly handled. The Committee may require additional strengthening to be fitted in any ship which, in their opinion, would otherwise be subjected to severe stresses due to particular features of the design, or where it is desired to make provision for exceptional load or ballast conditions.

1.4 Advisory services

1.4.1 The Rules do not cover certain technical characteristics, such as stability except as mentioned in Pt 1, Ch 2, 1.1.8, trim, vibration (other than local panel) and docking arrangements, etc. The Committee cannot assume responsibility for these matters but is willing to advise upon them on request.

1.5 Interpretation

1.5.1 The interpretation of the Rules is the sole responsibility and at the sole discretion of Lloyd's Register (hereinafter referred to a 'LR'). Where there is any doubt regarding the interpretation of the Rules it is the designers' responsibility to obtain clarification from LR prior to submission of plans and data for appraisal. Similarly, where there is any doubt regarding the interpretation of the Owners' requirements it is the designers' responsibility to obtain clarification from the Owners prior to the submission of plans.

1.5.2 Attention is drawn to the fact that Codes of Practice issued by IMO contain requirements which are outside classification as defined in these Rules. Whilst they will not be mandatory for naval ships they may be adopted as identified by the Naval Authority.

1.6 Aesthetics

1.6.1 LR is not concerned with the general arrangement, layout and appearance of the ship; the responsibility for such matters remains with the Builders and/or Designers to ensure that the agreed specification is complied with. LR is however concerned with the quality of workmanship, in this respect the acceptance criteria as required by Rules, LR Survey Procedures or equivalent are to be complied with.

1.7 Constructional configuration

1.7.1 The Rules provide for a basic structural configuration of a multi-deck or a single deck hull which includes a double bottom, or a single bottom arrangement. The structural configuration may also include a single or multiple arrangement of deck openings, and tanks.

■ *Section 2*
Direct calculations

2.1 General

2.1.1 Direct calculations may be specifically required by the Rules or may be required for ships having novel design features, as defined in 1.2, or may be submitted in support of alternative arrangements and scantlings. LR may, when requested, undertake calculations on behalf of designers and make recommendations in regard to suitability of any required model tests.

2.1.2 Where model testing is undertaken to complement direct calculations the following details would normally be required to be submitted: Schedule of tests, details of test equipment, input data, analysis and calibration procedure together with tabulated and plotted output.

2.2 Submission of direct calculations

2.2.1 In cases where direct calculations have been carried out, the following supporting information should be submitted as applicable:

- (a) Reference to the direct calculation procedure and technical program used.
- (b) A description of the structural modelling.
- (c) A summary of analysis parameters including properties and boundary conditions.
- (d) Details of the loading conditions and the means of applying loads.
- (e) A comprehensive summary of calculation results. Sample calculations should be submitted where appropriate.

2.2.2 In general, submission of large volumes of input and output data associated with such programs as finite element analysis will not be necessary.

2.2.3 The responsibility for error free specification and input of program data and the subsequent correct transposition of output rests with the Designer.

Section 3 Equivalents

3.1 Alternative arrangements and scantlings

3.1.1 In addition to cases where direct calculations are specifically required by the Rules, LR will consider alternative arrangements and scantlings which have been derived by direct calculations in lieu of specific Rule requirements. All direct calculations are to be submitted for examination.

3.1.2 Where calculation procedures are employed, supporting documentation is to be submitted for appraisal and this is to include details of the following:

- calculation methods;
- assumptions and references;
- loading;
- structural modelling;
- design criteria and their derivation, e.g. permissible stresses, factors of safety against plate panel instability, etc.

3.1.3 LR will be ready to consider the use of Builder's programs for direct calculations in the following cases:

- (a) Where it can be established that the program has previously been satisfactorily used to perform a direct calculation similar to that now submitted.
- (b) Where sufficient information and evidence of satisfactory performance is submitted to substantiate the validity of the computation performed by the program.

3.1.4 Alternative arrangements or fittings which are considered to be equivalent to the Rule requirements will be accepted.

3.1.5 Where no special reference is made in this Part to specific requirements, the construction is to be efficient for the intended purpose and to conform to good practice.

3.1.6 Where items are of a novel or unconventional design or manufacture, it is the responsibility of the Builder to demonstrate their suitability and equivalence to the Rule requirements.

3.1.7 Alternative arrangements which are in accordance with the requirements of a Naval Authority may be accepted as equivalent to the requirements of this Part of the Rules.

Section 4 Information required

4.1 Submission of plans and data

4.1.1 Plans and data required to be submitted are indicated in Pt 6, Ch 1,2.2.

4.1.2 Plans are generally to be submitted in triplicate, but one copy only is necessary for supporting documents and calculations.

4.1.3 Plans are to contain all necessary information to fully define the structure, including construction details, equipment and systems as appropriate.

4.2 Standard designs

4.2.1 Where a ship is a standard design produced in several versions, the plans and data are to clearly define the differences between each version.

4.2.2 Where the ship is a Builder's standard design to be built from previously approved plans and data, a schedule of applicable plans, etc., is to accompany the Request for Survey. Plans of any proposed modifications and changes to the previously approved plans are to be submitted for approval prior to the commencement of any work.

4.2.3 Plan approval of standard designs is only valid so long as no applicable Rule changes take place. When the Rules are amended, the plans for standard types are to be submitted for re-approval.

4.3 Plans and data to be supplied to the ship

4.3.1 A copy of the final Loading Manual or stability information book, (where applicable) when approved, and details of the loadings applicable to approved decks, are to be placed on board the ship.

4.3.2 Copies of all main scantling plans are to be readily available on board ship for the purposes of repairs, identifying materials and condition assessment.

4.3.3 Details of any corrosion control system fitted are to be placed on board the ship.

4.3.4 Where in-water surveys are required, approved plans and information covering the items detailed in Pt 6, Ch 1,2.2 are to be placed on board.

Section 5 Definitions

5.1 General

5.1.1 The following definitions apply except where they are inappropriate or where specifically defined otherwise.

5.2 Principal particulars

5.2.1 Length waterline, L_{WL} , is the distance, in metres, measured on a waterline at the design draught from the fore side of the stem to the after side of the stern or transom as shown in Fig. 1.5.1.

Fig. 1.5.1 Lengths

5.2.2 Rule length, L_R , is the distance, in metres, on a waterline at the design draught from the forward side of the stem to the after side of the rudder post or to the centre of the rudder stock if there is no rudder post. L_R is to be not less than 96 per cent, and need not be greater than 97 per cent, of the extreme length on a waterline at the design draught. In vessels without rudders, the Rule length, L_R , is to be taken as 97 per cent of the extreme length on a waterline at the design draught. In vessels with unusual stem or stern arrangements, the Rule length will be specially considered.

5.2.3 All references to longitudinal locations in the Rules are to be taken as forward of the aft end of L_R unless otherwise stated, e.g. $0.75L_R$ is 75 per cent of L_R forward of the aft end of L_R .

5.2.4 Length between perpendiculars, L_{PP} , in metres is the distance, in metres, on the waterline at the design draught from the forward to the after perpendicular.

5.2.5 The forward perpendicular, F.P., is the perpendicular at the intersection of the waterline at the design draught with the fore side of the stem.

5.2.6 The after perpendicular, A.P., is the perpendicular at the intersection of the waterline at the design draught with the after side of the rudder post or to the centre of the rudder stock for vessels without a rudder post or to the intersection with the transom profile on the centreline.

5.2.7 Length overall, L_{OA} , is the distance, in metres, measured parallel to the deep load waterline from the fore side of the stem to the after side of the stern or transom, excluding rubbing strakes and other projections as shown in Fig. 1.5.1.

5.2.8 Waterline breadth, B_{WL} , is generally the greatest moulded breadth, in metres, measured at the design draught, as shown in Fig. 1.5.2.

Fig. 1.5.2 Transverse dimensions

5.2.9 Breadth, B , is generally the greatest moulded breadth, in metres, throughout the depth of the ship or as defined in appropriate Chapters. For vessels of unusual cross section the breadth will be specially considered.

5.2.10 Depth, D , is measured, in metres, at amidships, from top of keel plate to the moulded deck line at side on the uppermost continuous deck, or as defined in appropriate Chapters or standards. When a rounded gunwale is arranged, the depth D is to be measured to the continuation of the moulded deck line at side.

5.2.11 Draught, T , is the design draught, in metres, measured from moulded baseline.

5.2.12 Block coefficient, C_b , is the block coefficient at draught T corresponding to a waterline at the design draught, based on Rule length L_R and breadth B_{WL} , as follows:

$$C_b = \frac{\text{moulded displacement (m}^3\text{) at draught } T}{L_R B_{WL} T}$$

5.2.13 Design draught may be determined from the waterline when the vessel is in a deep condition plus any specified margins. In special circumstances, the operation of the vessel or the Owner's specification may require that a higher waterline be used.

5.2.14 Deep draught is measured at a displacement such that the ship is in all respects complete, and is fully loaded with full complement, stores, fuel, water and payload.

5.2.15 Payload is the equipment and stores that are carried by the vessel for the purposes of fulfilling its operational requirements.

5.3 Margins

5.3.1 Design margin is an allowance for uncertainties used in the estimation of weight for design purposes.

5.3.2 Build margin is an allowance for unforeseen changes that may need to be made by the builder of the vessel.

5.3.3 Admiralty board margin is an allowance to cater for modifications made by the Owner to the vessel or equipment during the design and build stages.

5.3.4 Growth margin is an allowance for future controlled and uncontrolled weight growth during the life of the ship.

5.3.5 In the absence of any specific requirements, the sum of the margins is to be taken as 15 per cent of the displacement at the deep draught.

5.4 Decks

5.4.1 Strength deck is normally the uppermost continuous deck. Other decks may be considered as the strength deck provided that such decks are structurally effective. Where the upper deck is stepped, as in the case of vessels with a quarter deck, the strength deck is stepped, see Pt 6, Ch 4, 1.

5.4.2 The weather deck is generally the lowest continuous deck exposed to sea and weather loads. It is to be defined at the early stages of design in conjunction with L_R and the Builder.

5.4.3 Other decks that are exposed to sea loads are to be assessed in accordance with the requirements for weather decks.

5.4.4 The damage control deck is the lowest deck on which continuous fore and aft access is provided to aid communications and recovery following damage. It is normally above the lowest vertical limit of watertight integrity the exact location being determined by the relevant sub-division and watertight integrity standard.

5.5 Co-ordinate system

5.5.1 Unless otherwise stated, the co-ordinate system is as shown in Fig. 1.5.3, that is, a right-hand co-ordinate system with the X axis positive forward, the Y axis positive to port and the Z axis positive upwards. Angular motions are considered positive in a clockwise direction about the X, Y or Z axes.

Fig. 1.5.3 NSR Co-ordinate system

5.6 Superstructure

5.6.1 For the purposes of strength assessment a superstructure is defined as a decked structure on the strength deck, extending from side to side of the vessel, or with its side plating being less than four per cent of the breadth, B , inboard of the shell plating.

5.7 Deckhouse

5.7.1 A deckhouse is in general defined as a decked structure on or above the strength deck with its side plating being four per cent or more of the breadth, B , inboard of the shell plating.

5.8 Weathertight

5.8.1 A boundary or closing appliance is considered weathertight if it is capable of preventing the passage of water into the ship in any sea conditions.

5.9 Watertight

5.9.1 A boundary or closing appliance is considered watertight if it is capable of preventing the passage of water in either direction under a head of water for which the surrounding structure is designed.

5.10 Terminology

5.10.1 Fig. 1.5.4 shows the general terminology adopted for structural items for a transversely and longitudinally framed ship.

5.10.2 Fig. 1.5.5 shows the general configuration of Naval ships of the NS1 and NS2 types. Various features are pointed out and are dealt with by the relevant Section of the Rules.

5.11 Extent of watertight subdivision

5.11.1 The minimum extent of watertight subdivision (internal), and integrity (internal and external), shall be such that it satisfies the requirements of the Navy. The standard of watertight subdivision and integrity shall be defined by the Navy or its nominated Naval Authority.

5.11.2 The minimum extent of watertight subdivision may be defined by a combination of decks, side shell and bulkheads or by a single deck.

5.11.3 Weathertight and watertight fittings and closing appliances are to be fitted in accordance with the requirements of the boundary on which they are placed.

5.11.4 For the calculation of watertight structural scantlings the pressure head is to be taken from the vertical limits of weathertightness determined by either intact or damage stability considerations determined by Ch 2,1.3 or the Naval Authority, see Pt 5, Ch 3,5.5.

5.12 Critical compartments

5.12.1 A critical compartment is one which, at battle stations, contains equipment or personnel without whom functions critical to combat survivability would be lost. These functions include the ability to fight, manoeuvre or communicate.

5.12.2 Critical compartments are typically the chart room, operations room, conning position, ship's control room and main communications office. Other compartments may be considered critical depending on ship's layout and design. The need for protecting critical compartments can be reduced by avoiding single point failure nodes and by concentrating and protecting those which cannot be avoided. A vulnerability analysis can be used to identify vulnerable critical compartments and the essential pieces of equipment or systems that are required to be protected, see 2.2.

5.12.3 Critical pipe and cable runs are routes in which the connections for survivability critical components run. They can cover individual routes or concentrated areas. An example is a run containing wave guides and signal cables for all the above water sensors on the mast.

5.13 Units system

5.13.1 Unless otherwise stated, the variables used in the Rules are expressed in the following units.

5.13.2 General

Distances	m
Primary spacings	m
Secondary spacings	mm

5.13.3 Hull girder properties

Dimensions	m
Area	m ²
Section modulus	m ³
Inertia	m ⁴
Area-moment	m ³

5.13.4 Stiffeners

Area	cm ²
Dimensions	mm
Inertia	cm ⁴
Section modulus	cm ³
Length/length effective	m

5.13.5 Plating

Breadth	mm
Length	m
Thickness	mm

5.13.6 Loads

Pressures	kN/m ²
Loads	kN
Bending moment	kN-m
Shear force	kN

5.13.7 Other items

Yield strength	N/mm ²
Stress	N/mm ²
Deflections	mm
Modulus of Elasticity	N/mm ²

■ Section 6

Building tolerances and associated repairs

6.1 Overview

6.1.1 The general tolerances for new building and subsequent repairs are to be in accordance with the requirements of the Naval Ship Survey Procedures Manual.

6.1.2 Tolerances to be used for constructional misalignment for all materials are to be discussed between Owners/Builders and the Surveyor and acceptable Standards agreed subject to the requirements of 6.1.1 or National Authority requirements where applicable. The permitted degree of inaccuracy/misalignment will vary according to whether the defect is:

- (a) In primary structure.
- (b) In secondary structure.
- (c) Equipment supporting structure or underwater plate near acoustic equipment.
- (d) Aesthetically pleasing.

6.1.3 The requirements of these Rules are primarily concerned with ensuring items (a) and (b). The equipment manufacturer will be able to give advice on the maximum noise or misalignment that can be tolerated from item (c). Aesthetics, item (d) are at the discretion of the Owner.

■ Section 7

Inspection and testing

7.1 Overview

7.1.1 The general requirements for testing and inspection of structural items are to be in accordance with the requirements of the Pt 6, Ch 6,6 and LR's *Naval Survey Guidance for Steel Ships*.

7.1.2 Adequate facilities are to be provided to enable the Surveyor to carry out a satisfactory inspection and testing of all components during each stage of prefabrication and construction.

Section

- 2 **Rule structural concept**
- 3 **Main hull structure**
- 4 **Bulkhead arrangements**
- 5 **Fore and aft end arrangements**
- 6 **Machinery space arrangements**
- 7 **Superstructures, deckhouses, bulwarks, sponsons and appendages**
- 8 **Pillars and pillar bulkheads**

Section 1 General

1.1 Application

1.1.1 This Chapter illustrates the general principles to be adopted in the design of naval ships. Principles for subdivision and for maintaining watertight integrity are also covered.

1.1.2 Where additional requirements relating to particular ship types apply, these requirements are indicated in the appropriate Parts and are to be complied with as necessary.

1.2 Definitions

1.2.1 The Down flooding angle is the least angle of heel at which openings in the hull, superstructure or deckhouses, which cannot be closed weathertight, immerse and allow flooding to occur.

1.2.2 The minimum required angle of down flooding, θ_{df} , is to be taken as 40° except when a higher minimum angle is required by the stability and subdivision standard specified by the Naval Authority, see Pt 1, Ch 2, 1.1.9.

1.3 Watertight and weathertight integrity

1.3.1 The extents of the external and internal watertight and weathertight integrity are defined by the intact and damage stability requirements, see Pt 1, Ch 2, 1.1.9. From these extents, the design pressure heads for bulkheads and other boundaries can be derived as well as the closing arrangement requirements for openings. Weathertight and watertight integrity are defined in Ch 1, 5 and see Chapter 4 for the requirements for closing arrangements.

1.3.2 Intact stability

1.3.2.1 Intact stability calculations to satisfy the applicable criteria may be based on the buoyancy of the main hull, together with any superstructures that have watertight and weathertight boundaries, see Fig. 2.1.1(a) and Fig. 2.1.2(a).

Fig. 2.1.1 International standards

1.3.2.2 Doors, hatches, ventilators, windows, sidelights, etc. provided with closing appliances which can be secured weathertight, and small openings through which progressive flooding cannot take place are not considered as down flooding points.

1.3.2.3 If the angle of down flooding is less than θ_{df} , see 1.2.2, with the ship at its design draught, it is necessary to establish whether there is sufficient area under the righting lever curve up to the angle of down flooding. If there is insufficient area, then the opening which is causing down flooding to occur is to be provided with a weathertight closing appliance, or be repositioned.

- Below the limit of weathertight integrity defined by the transient roll angle and above the limit of watertight integrity the internal structure is to be designed to prevent progressive flooding of water into other compartments.

1.3.3.3 Fig. 2.1.2 represents a standard based on damaged stability draft and heel envelope approach commonly used by Navies.

- Below the limit of watertight integrity the boundary structure is to be watertight.
- Below the limit of weathertight integrity defined by the transient roll angle the boundary structure is to be weathertight.
- Above the limit of weathertight integrity the boundary structure, or some other internal boundary, may need to be gas-tight for CBRN protection.
- Below the limit of watertight integrity defined by the locii of static damage waterlines the watertight bulkheads are to be designed as watertight.
- Below the limit of weathertight integrity defined by the transient roll angle and above the limit of watertight integrity the internal structure is to be weathertight in order to prevent progressive flooding of water into other compartments.

1.3.3.4 In the absence of specific information on the vertical limit of watertight integrity, the upper extent of the watertight boundary may be assumed with the apex of the triangle on the damage control deck nominated by the Naval Authority at the location under consideration, see Fig. 2.1.2 and Pt 3, Ch 1,5.4.4.

1.3.3 Damage stability

1.3.3.1 Typically there are two approaches to defining the limits of watertight and weathertight integrity:

- One where the watertight integrity is defined by the bulkhead or freeboard deck, in accordance with normal SOLAS requirements.
- The other is based on watertight integrity up to a damaged stability draft and heel envelope, the latter is commonly used by Navies.

These two approaches are illustrated in Figs. 2.1.1(b) and 2.1.2(b) respectively.

1.3.3.2 Fig. 2.1.1(b) represents the SOLAS style requirements.

- Below the limit of watertight integrity the boundary structure is to be watertight.
- Below the limit of weathertight integrity defined by the transient roll angle the boundary structure is to be weathertight, in order to prevent ingress of water into the enclosed volume considered buoyant in the stability calculations and prevent downflooding.
- Above the limit of weathertight integrity the boundary structure, or some other internal boundary, may need to be gas-tight for CBRN protection.
- Below the limit of watertight integrity defined by the top of the watertight bulkhead, the bulkhead is to be designed as watertight.

1.4 Structural redundancy

1.4.1 The role and duty of a naval ship dictates that a certain degree of structural redundancy should be incorporated in the design. It is recommended that, as a minimum standard, a basic level of structural redundancy is included where practicable. This is normally achieved by considering likely damage scenarios, identifying the effects on structure, assessing the new loads and ensuring that the remaining structure will be satisfactory.

1.4.2 These Rules will not automatically ensure that a ship has structural redundancy. It is the responsibility of the designer to consider and design for the possible loads on a structure from damage scenarios. The **RSA** notation can be used to define residual strength requirements.

1.4.3 At a very basic level structural redundancy can be achieved by considering the removal of appropriate items of structure and re-evaluating the strength of remaining members using the loads presented in these Rules. Alternatively, the overall structural redundancy can be formally assessed and a notation assigned using the residual strength analysis detailed in 1.5.

1.5 Residual Strength Assessment, RSA

1.5.1 The design of a naval ship necessitates the reliable evaluation of its structural vulnerability to ensure the existence of adequate residual strength in the event of structural damage following a contact/collision incident or as a result of wartime activities. This strength assessment is additional to that required to cope with the design bending moments derived from environmental sea-state loading. The **RSA** notation within the Rules may be used to formally assess the overall structural redundancy.

1.5.2 The Owner may specify that a residual strength assessment is not required. In this case, the residual strength notation and all other notations which require the residual strength notation will not be assigned.

1.5.3 The capability to survive is to be judged on the residual structural strength after damage being able to meet specified global strength requirements and also local strength requirements in the event of damage leading to flooding, see Pt 6, Ch 4,4.

1.5.4 A residual strength assessment performed as defined in the Rules, assumes that a ship can remain operational for a limited period of time in reduced sea states, see Pt 6, Ch 4,1.2. Where a Naval Authority wishes to maintain a high operational capability following damage, special consideration will need to be given and revised criteria will be set.

1.5.5 The Owner may specify an alternative mission statement, in which case the requirements of the residual strength assessment procedure are to satisfy the Owner's definition.

1.5.6 The residual strength assessment as defined in the Rules considers three main definitions of damage:

- Peacetime damage extents, see Pt 6, Ch 4,2.
- Military threats, see Pt 4, Ch 2,7.
- As defined by the Owner.

1.5.7 The environmental parameters for the residual strength assessment procedure are given in Pt 5, Ch 2. The local and global loads for use in the **RSA** assessment procedure are given in Pt 5, Ch 3,5 and Pt 5, Ch 4,5 respectively.

1.5.8 **RSA** notation assessment levels are given in Pt 4, Ch 2,7. The acceptance criteria and procedures to be adopted for the application of the residual strength notation are given in Pt 6, Ch 4,4. See also Pt 1, Ch 2,3.6.9.

1.5.9 Further guidance for undertaking residual strength analysis for the determination of a residual strength notation is given in LR's Naval Ship Guidance Notes.

■ Section 2

Rule structural concept

2.1 General

2.1.1 The Rules are based on the concept that the structural and watertight integrity and general safe operation of the ship will not be compromised by static and dynamic loads experienced during normal operating conditions.

2.1.2 For derivation of scantlings of stiffeners, beams, girders, etc., the formulae in the Rules are normally based on elastic or plastic theory using simple beam models supported at one or more points and with varying degrees of fixity at the ends, associated with an appropriate concentrated or distributed load. Alternative methods will be considered.

2.2 Scantlings

2.2.1 Scantlings are generally based on the strength required to withstand loads imposed by the sea, payload, ballast, fuel and other operational loads. However, the Rules assume that the nature and stowage of the payload, ballast, etc., are such as to avoid excessive structural stresses, and deformation.

2.2.2 The design loads and pressures given in Part 5 are to be used with scantling formulae or direct calculation methods to derive scantlings based on maximum allowable stress or other suitable strength criteria.

2.2.3 Hull structural vibration resulting from cyclic loadings arising from the sea and other sources are to be such that the normal operation and structural integrity of the ship are not impaired.

2.2.4 Static loads are based on standard conditions defined in Part 5, or determined from loading conditions submitted by the Builder.

2.2.5 Dynamic loadings are examined for both the local and global structures. These loadings are based upon the designer's stated operational and environmental conditions or the Rule minimum criteria, whichever is the greater.

2.2.6 Wave induced loads are considered both in the static condition, i.e. hydrostatic and pitching pressures, and in the dynamic mode, i.e. impact, slamming and hogging and sagging wave loading conditions.

2.2.7 Hull girder strength will in general require to be investigated dependent upon the length, configuration, proportions, proposed scenarios, etc., of the ship.

2.2.8 Structure in way of Replenishment at Sea, **RAS**, positions, cranes, heavy lift route points, weapon handling, etc., are to be designed in accordance with Pt 4, Ch 1. The equipment is to be designed in accordance with the requirements of the Naval Authority, see Vol 1, Pt 1, Ch 2,1.1.

2.2.9 Scantling requirements in respect of miscellaneous items of structure such as local foundations, base plates, insert plates, bollards, etc., are not specifically indicated within these Rules. However the acceptance of such items will be specially considered on the basis of experience, good practice and direct calculation where appropriate.

2.3 Definitions and structural terms

2.3.1 For the purpose of clarifying the nomenclature of items of structure referred to throughout the Rules, the following definitions are given:

- Secondary members are stiffeners supporting shell, deck or bulkhead plating, e.g. side/bottom/deck longitudinals, frames and beams, and transverse/longitudinal bulkhead stiffeners.
- Primary members are those members supporting secondary members and will be the predominant members in grillage systems, e.g:
 - Bottom structure – floors, bottom and inner bottom transverse and girders.
 - Deck structure – deck transverses and girders.
 - Side structure – side transverses and side stringers.
 - Bulkheads – vertical webs and bulkhead stringers.

Deep web frames are members supporting primary members between bulkheads or decks, where additional support is necessary.

2.3.2 The fore end region structure is considered to include all structure forward of $0,7L_R$.

2.3.3 The aft end region structure is considered to include all structure aft of $0,3L_R$.

■ Section 3 Main hull structure

3.1 General

3.1.1 The Rules are formulated to provide for scantling derivation for designs comprising the following structural framing systems. Details of the requirements are given in Pt 6, Ch 2.

- (a) Primary/secondary stiffener systems – where, due to the relative differences in stiffness of the members, the secondary members are considered to act independent of, and are supported by, the primary members.
- (b) Grillage systems – where the relative stiffness of the orthogonal stiffening is similar and work together to support the applied loads. The grillage system is in turn supported by major structural members such as bulkheads or decks.

3.1.2 For practical reasons of fabrication and continuity of structure, orthogonal systems using members of the same depth should not be employed. A minimum web depth difference of 40 mm is generally to be used to allow for the passage through the web at the intersections.

3.1.3 It is recognised that there will be a reduction in transverse 'racking' strength in association with the grillage stiffening system where the predominantly stiffer transverse web of the primary/secondary system is missing. In large areas of grillage systems the 'racking' strength, therefore, will be specially considered.

3.1.4 For NS1 and NS2 ships, longitudinal framing, in general, is to be adopted in the bottom shell, decks and inner bottom, with transverse or longitudinal framing at the side shell and longitudinal bulkheads. In NS3 ships, transverse or longitudinal framing may be universally adopted.

3.1.5 The adopted framing system whether longitudinal or transverse is required to be continuous. Where it is impracticable to comply with these requirements or where it is proposed to terminate the framing structure in way of other primary members such as the transom, bulkheads or integral tank boundaries, they are to be bracketed in way of their end connections to maintain the continuity of structural strength. Particular care is to be taken to ensure accurate alignment of the brackets. Brackets are in general to have soft toes and to terminate on structure that is capable of supporting the transmitted bending moment and forces.

3.1.6 The arrangement of the connection between any stiffener and bracket is to be such that at no point in the connection are the section modulus and inertia reduced to less than that of the stiffener with associated plating.

3.1.7 The arrangement of material is to be such as will ensure structural continuity. Abrupt changes of shape or section, sharp corners and points of stress concentration are to be avoided.

3.1.8 Where members abut on both sides of a bulkhead or similar structure, care is to be taken to ensure good alignment and continuity of strength.

3.1.9 The fitting of pillar bulkheads is preferable to pillars. The fitting of pillars is to be avoided in hangar and vehicle decks and where connected to the inner bottom. Where enhanced shock and blast requirements are specified, only pillar bulkheads may be fitted. When fitted, pillars and pillar bulkheads are to be in the same vertical line wherever possible, and elsewhere arrangements are to be made to transmit the out of line forces satisfactorily. The load at head and heel of pillars is to be effectively distributed and arrangements are to be made to ensure the adequacy and lateral stability of the supporting members.

3.1.10 End connections of structural members are to provide adequate end fixity and effective distribution of the load into the supporting structure.

3.1.11 The corners of large openings in the shell and decks from $0,25L_R$ to $0,75L_R$ are to be elliptical, parabolic or circular. Where predominantly unidirectional stress fields are anticipated, elliptical or parabolic corners are recommended. Where biaxial or torsional stress fields are expected, circular corners are recommended.

3.1.12 Where elliptical corners are arranged the major axis is to be fore and aft, the ratio of the major to minor axis is to be not less than 2 to 1 nor greater than 2,5 to 1, and the minimum half-length of the major axis is to be defined by l_1 in Fig. 2.3.1. Where parabolic corners are arranged, the dimensions are also to be as shown in Fig. 2.3.1. An increase in plate thickness will not generally be required.

3.1.13 Where circular corners are arranged, a radius not less than 1/20 of the breadth of the opening is to be used with a minimum of 75 mm. For circular corners, inserts of the size and extent shown in Fig. 2.3.2 will, in general, be required. The thickness of insert plates is to be not less than 25 per cent greater than the adjacent plating with a minimum increase of 4 mm. The increase need not exceed 7 mm.

3.1.14 For other shapes of corner, inserts of the size and extent shown in Fig. 2.3.2 will, in general, be required.

3.1.15 Manholes, lightening holes and other cut-outs are to be avoided in way of concentrated loads and areas of high shear. In particular, manholes and similar openings are not to be cut in vertical or horizontal diaphragm plates in narrow cofferdams or in floors and double bottom girders close to their span ends, or below the heels of pillars, unless the stresses in the plating and the panel buckling characteristics have been calculated and found satisfactory. The size of openings are to be in accordance with 3.2.9.

3.1.16 Manholes, lightening holes and other openings are to be suitably framed and stiffened where necessary.

3.1.17 Provision is made for the free passage of air and water taking into account the pumping rates required.

3.1.18 Particular care is to be given to the positioning of drain holes to reduce stress concentrations and ensure adequate drainage from all parts of the ship's hull to the suction. They are to be placed as close to the bottom as practicable.

3.1.19 Suitable arrangements are to be made to provide free passage of air from all parts of tanks to the air pipes. They are to be placed as close to the top of the tank as practicable. Air pipes of sufficient number and area are to be fitted to each tank in accordance with Pt 3, Ch 4,6.

3.1.20 Air and drain holes, notches and scallops are to be kept at least 200 mm clear of the toes of end brackets and other areas of high stress. Openings are to be well rounded with smooth edges. Closely spaced scallops are not permitted.

3.1.21 Widely spaced air or drain holes, cut entirely in the web adjacent to, but clear of the welded connection, may be accepted, provided that they are of elliptical shape, or equivalent, to minimise stress concentrations, see Fig. 2.3.3.

3.2 Primary members

3.2.1 The following guidelines for the design of primary members are to be adopted. Scantling requirements for primary members are given in Pt 6, Ch 3.

3.2.2 Primary members are to be so arranged as to ensure effective continuity of strength, and abrupt changes of depth or section are to be avoided. Where members abut on both sides of a bulkhead, or on other members, arrangements are to be made to ensure that they are in alignment. Primary members are to form a continuous line of support and, wherever possible, a complete ring system.

3.2.3 Primary members are to have adequate lateral stability and web stiffening and the stiffening structure is to be arranged to minimise hard spots and other sources of stress concentration.

3.2.4 Primary members are to be provided with adequate end fixity by end brackets or equivalent structure. The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint and effective distribution of the load from the member. Where a deck girder or transverse is connected to a vertical member on the shell or bulkhead, the scantlings of the latter may be required to be increased to provide adequate stiffness to resist rotation of the joint.

3.2.5 Where the primary member is supported by structure which provides only a low degree of restraint against rotation, the member is generally to be extended beyond the point of support and thereafter tapered and/or scarfed into the adjacent structure over a distance generally not less than two frame spaces.

3.2.6 Where primary members are subject to concentrated loads, particularly if these loads are out of line with the member web, additional strengthening may be required.

3.2.7 Where a member is continued over a point of support, such as a pillar or pillar bulkhead stiffener, the design of the end connection is to be such as to ensure the effective distribution of the load into the support. Brackets are generally required but alternative arrangements will be considered.

3.2.8 The thickness of the brackets supporting primary members is to be not less than that of the primary member web. The free edge of the bracket is to be stiffened.

3.2.9 Where openings are cut in the web or primary members, the depth of opening is not to exceed 50 per cent of the web depth, and the opening is to be so located that the edges are not less than 25 per cent of the web depth from the face plate. The length of opening is not to exceed the web depth or 60 per cent of the secondary member spacing, whichever is the greater, and the ends of the openings are to be equidistant from the corners of cut-outs for secondary members. Where larger openings are proposed, the arrangements and compensation required will be specially considered.

3.2.10 Openings are to have well rounded corners and smooth edges and are to be located having regard to the stress distribution and buckling strength of the panel in which they are situated.

3.2.11 Cut-outs for the passage of secondary members are to be designed to minimise the creation of stress concentrations. The breadth of cut-out is to be kept as small as practicable and the top edge is to be rounded, or the corner radii made as large as practicable. The extent of the direct connection to the web plating, or the scantlings of lugs or collars, is to be sufficient for the loads to be transmitted from the secondary member, see also Pt 6, Ch 6,5.5.

3.2.12 Stiffeners in areas likely to experience slamming, impact or dynamic loads are to be lugged or bracketed to the web of the primary member at their intersections, see also Pt 6, Ch 6,5.5.

3.3 Shell plating

3.3.1 Scantling requirements for shell plating are given in Pt 6, Ch 3,5.

3.3.2 The sheerstrake is generally to be taken as the side shell, locally reinforced in way of deck/hull connection. The amount of local reinforcement will be dependent upon the arrangement of structure and the proposed service.

3.3.3 In general, openings are not to be cut in the sheerstrake, however, if operational requirements dictate, openings that are less than 20 per cent of the depth of the sheerstrake may be accepted. Openings greater than 20 per cent of the depth of the sheerstrake will require special consideration.

3.3.4 Where large side shell openings, such as side aircraft lifts, are proposed, detailed calculations are to be submitted.

3.3.5 Where rounded gunwales are fitted, arrangements are to ensure a smooth transition from rounded gunwale to angled gunwale.

3.3.6 At the ends of superstructures where the side plating is extended and tapered to align with the bulwark plating, the transition plating is to be suitably stiffened and supported. Where freeing ports or other openings are essential in this plate, they are to be suitably framed and kept well clear of the free edge.

3.3.7 Sea-inlets, or other openings, are to have well rounded corners and, so far as is practicable, are to be kept clear of the bilge radius, chine or radiused sheerstrake. Arrangements are to be made to maintain the strength in way of the openings. Additional thickness is to be required in accordance with Pt 6, Ch 3,5.7. Adequate provision is to be taken to prevent local resonance problems. Additional guidance for the design of sea-inlets or other openings, is given in Pt 4, Ch 1,8.

3.3.8 Openings on or near the bilge radius may be accepted provided that they are of elliptical shape, or equivalent, to minimise stress concentrations and are, in general, to be kept clear of weld connections.

3.3.9 The scantlings of appendages (e.g. 'A' brackets) are covered in Chapter 3. However, in way of the hull penetrations, particular care will be required to be given to the strength and watertight integrity of the shell.

3.4 Shell framing

3.4.1 The scantlings of shell structure are to be determined in accordance with Pt 6, Ch 3,6.

3.4.2 Longitudinal framing is, in general, to be adopted in the bottom, but special consideration will be given to proposals for transverse framing in this region, see 3.1.4.

3.4.3 For NS1 and NS2 ships, the bottom and side longitudinals are to be continuous in way of both watertight and non-watertight floors, but equivalent arrangements will be specially considered.

3.4.4 Bottom and side longitudinals are to be supported by primary transverse structure such as bottom transverses, floors or bulkheads, generally spaced not more than 2,5 m apart in NS1 and NS2 ships, and 1,5 m in NS3 ships.

3.4.5 Bottom and side transverses, where fitted, are to be continuous and substantially bracketed at their end connections to side and deck transverses and bottom floors.

3.4.6 Bottom and side frames are to be effectively continuous and bracketed at their end connections to side frames, deck beams and bottom floors as appropriate. Side frames are to be supported by decks or stringers spaced not more than three metres apart.

3.4.7 Bottom girders and side stringers supporting transverse frames, are to be continuous through transverse bulkheads and supporting structures. They are to be supported by deep transverse web frames, floors, bulkheads, or other primary structure, generally spaced not more than three metres apart.

3.4.8 For primary members the web stability, openings in the web and continuity and alignment are to be in accordance with 3.2.9.

3.4.9 For ships intended for beach landing operations, see Pt 4, Ch 2,8.

3.4.10 For berthing and docking requirements, see Pt 3, Ch 5,10.

3.4.11 Where the shell framing is of unusual design or proportions, the scantlings are to be determined by direct calculation.

3.5 Single bottom structure

3.5.1 Scantling requirements for single bottom structure are given in Pt 6, Ch 3,7.

3.5.2 The requirements of this Section provide for single bottom construction in association with transverse and longitudinal framing systems, see 3.1.4.

3.5.3 All girders are to extend as far forward and aft as necessary and care is to be taken to avoid any abrupt discontinuities. Where girders are cut at bulkheads, alignment and longitudinal strength are to be maintained.

3.5.4 Particular care is to be taken to ensure that the continuity of structural strength in way of the intersection of transverse floors and longitudinal girders is maintained. The face flats of such stiffening members are to be effectively connected.

3.5.5 The single bottom structure in way of the keel and girders is to be sufficient to withstand the forces imposed by dry-docking the ship, see Pt 4, Ch 2,8.

3.5.6 A continuous centreline girder is, in general, to be fitted in all ships throughout the length of the hull as far forward and aft as practicable.

3.5.7 Where the floor breadth at the upper edge exceeds 6,0 m side girders are to be fitted at each side of the centre girder such that the spacing between the side and centre girders or between the side girders themselves is not greater than 3 m. In general, side girders where fitted are to be continuous, extend as far forward and aft as practicable and to terminate in way of bulkheads, deep floors or other primary transverse structure. In addition, continuous intercostal longitudinal stiffeners are to be fitted where the panel size exceeds the ratio 4 to 1.

3.5.8 In ships with a transversely framed bottom construction, the bottom shell plating is, in general, to be reinforced with additional continuous, or intercostal, longitudinal stiffeners. Alternative arrangements to be considered.

3.5.9 For ships intended for beach landing operations, see Pt 4, Ch 2,8.

3.5.10 In longitudinally framed ships, plate floors are to be fitted as given in 3.4.4. The connections with side transverse web frames are to be as required by 3.4.6. Additional transverse floors or webs are in general to be fitted at the half spacing of primary transverse structure in way of engine seatings, thrust bearings, pillars, skegs, bilge keels and the bottom of the ship forward.

3.5.11 The tops of the floors may be level from side to side. However, in ships having considerable rise of floor the depth of floors may require to be increased to maintain the required section modulus.

3.5.12 In general, the floors in way of the stern tubes, shaft brackets, etc., are to provide effective support for these items.

3.6 Double bottom structure

3.6.1 Scantlings of double bottoms are to be in accordance with Pt 6, Ch 3,8.

3.6.2 Double bottoms are in general to be fitted in NS1 ships and are to extend from the collision bulkhead to the aft peak bulkhead, as far as this is practicable within the design and proper working of the ship. The subdivision standard specified by the Naval Authority adopted in accordance with 1.3 may contain additional requirements for the height and extent of the double bottom.

3.6.3 A double bottom is generally not required in way of watertight compartments used exclusively for the carriage of liquids, provided the safety of the ship in the event of bottom damage is not thereby impaired. Suitable scarfing arrangements are to be made to maintain continuity of the inner bottom.

3.6.4 The inner bottom is to be continued to the ship's side as far as practicable, in such a manner as to protect the bottom to the turn of bilge or chine.

3.6.5 The centreline girder and side girders are to extend as far forward and aft as practicable and care is to be taken to avoid any abrupt discontinuities. Where girders are cut at bulkheads, their alignment and longitudinal strength is to be maintained.

3.6.6 Small wells constructed in the double bottom structure are not to extend in depth more than necessary. A well extending to the outer bottom may, however, be permitted at the after end of the shaft tunnel of the ship. Other well arrangements (e.g. for lubricating oil under main engines) may also be considered provided they give protection equivalent to that afforded by the double bottom.

3.6.7 Sufficient manholes are to be cut in the inner bottom, floors and side girders to provide adequate access to, and ventilation of, all parts of the double bottom. Openings are to be in accordance with 3.2.9.

3.6.8 The number and position of manholes are to be such that access under service conditions is neither difficult nor dangerous.

3.6.9 Manholes and their covers are to be of an approved design or in accordance with a recognised National or International Standard.

3.6.10 Provision is to be made for the free passage of air and water from all parts of the tanks to the air pipes and suctions, account being taken of the pumping rates required.

3.6.11 Adequate access is also to be provided to all parts of the double bottom for future maintenance, surveys and repairs. The edges of all openings are to be smooth.

3.6.12 A plan showing the location of manholes and access openings within the double bottoms is to be submitted.

3.6.13 Manholes, lightening holes and other cut-outs are to be avoided in way of concentrated loads and areas of high shear. Details are given in 3.1.15.

3.6.14 Air and drain holes, notches and scallops are to be in accordance with 3.1.7.

3.6.15 The Rules are formed on the basis that access to double bottoms will be by means of manholes with bolted covers. However, alternative arrangements will be specially considered.

3.6.16 In way of ends of floors and girders and transverse bulkheads, the number and size of holes are to be kept to a minimum, the openings are to be circular or elliptical and edge stiffening may be required.

3.6.17 Holes are not to be cut in the centre girder, except in tanks at the forward and after ends of the ship or where tank widths are reduced unless additional stiffening and/or compensation is fitted to maintain the structural integrity.

3.6.18 Centreline and side girders are to be continuous and sufficient to withstand the forces imposed by dry-docking the ship, see Part 4. Vertical stiffeners are to be fitted at every bracket floor.

3.6.19 Where the breadth of floor is greater than 6,0 m, additional side girders having the same thickness as the floors are to be fitted. The number of side girders is to be such that the distance between the side girders and centre girder and margin plate, or between the side girders themselves, does not exceed 3,0 m (for transversely framed ships, 5 m for longitudinally framed ships).

3.6.20 Side girders where fitted are to extend as far forward and aft as practicable and are in general to terminate in way of bulkheads, deep floors or other primary transverse structure.

3.6.21 Plate floors are, in general, to be continuous between the centre girder and the margin plate. Vertical stiffeners are to be fitted to the floors, the number and positions of these stiffeners being dependent on the arrangement of the double bottom structure.

3.6.22 In longitudinally framed ships, plate floors or equivalent structure are, in general, to be fitted in accordance with 3.4.4 and additionally at the following positions:

- (a) At every half spacing of primary transverse structure as given in 3.4.4, in way of the bottom of the ship forward of $0,8L_R$.
- (b) Underneath pillars and bulkheads.

3.6.23 In transversely framed NS3 ships, plate floors are to be fitted at every frame in the engine room, under bulkheads, in way of change in depth of double bottom and elsewhere at a spacing not exceeding 1,5 m.

3.6.24 Between plate floors, the shell and inner bottom are to be supported by bracket floors. The brackets are to have the same thickness as plate floors and are to be stiffened on the unsupported edge.

3.6.25 In longitudinally framed ships, the bracket floors are to extend from the centre girder and margin plate to the adjacent longitudinal, but in no case is the breadth of the bracket floor to be taken as less than 75 per cent of the depth of the centre girder. They are to be fitted at every frame at the margin plate, and those at the centre girder are to be spaced not more than 1,0 m apart.

3.6.26 In transversely framed ships, the breadth of the bracket floors, attaching the bottom and inner bottom frames to the centre girder and margin plate, is to be not less than 75 per cent of the depth of the centre girder, see Fig. 1.5.4(b) in Chapter 1.

3.6.27 Inner bottom longitudinals are to be supported by inner bottom transverses, floors, bulkheads or other primary structure, generally spaced not more than 2,5 m apart in NS1 and NS2 ships, and 1,5 m in NS3 ships.

3.6.28 The inner bottom longitudinals are to be continuous through the supporting structure.

3.6.29 Inner bottom transverses are to be continuous and to be substantially bracketed at their end connections to bottom transverses, bottom floors and tank side brackets.

3.6.30 In general, whilst the fitting of pillars connecting to the inner bottom is to be avoided, where they are fitted, the connections of the floors to the girders, and of the floors and girders to the inner bottom, are to be suitably increased. Where pillars are not directly above the intersection of plate floors and girders, partial floors and intercostals are to be fitted as necessary to support the pillars. Manholes are not to be cut in the floors and girders below the heels of pillars. Where longitudinal framing is adopted in the double bottom, equivalent stiffening under the heels of pillars is to be provided. Where the heels of pillars are carried on a tunnel, suitable arrangements are to be made to support the load.

3.6.31 Double bottoms are to be tested in accordance with the requirements of Pt 6, Ch 6,6 of the Rules.

3.6.32 The Rules are formed on the basis that access to double bottoms will be by means of manholes with bolted covers. However, alternative arrangements will be specially considered.

3.7 Deck structure

3.7.1 Scantlings of decks are to be in accordance with the requirements of Pt 6, Ch 3,10.

3.7.2 Where an inner bottom is not fitted, consideration of the ship's stability and strength following bottom damage is required. It may be appropriate to consider designing the lowest deck to be watertight. This is to be determined in conjunction with the damage stability analysis, assuming bottom damage.

3.7.3 The deck plating is to be supported by transverse beams with fore and aft girders; by longitudinals with deck transverses, or alternatively, by a grillage system of orthogonal and primary structure as provided for in 3.1.1. The transverse beams and deck transverses are to align with side main frames and side transverses respectively. For NS1 and NS2 ships, longitudinal framing is generally to be adopted, see 3.1.4.

3.7.4 Where transversely stiffened, beams are to be fitted at every frame and bracketed to the side frames. Deck transverses should also be fitted at the ends of large openings in the deck.

3.7.5 Primary stiffening members are to be continuous and substantially bracketed at their end connections to maintain continuity of structural strength.

3.7.6 Secondary stiffening members are to be effectively continuous and bracketed at their end connections as appropriate.

3.7.7 The ends of beams, longitudinals, girders and transverses are to be effectively built into the adjacent structure, or equivalent arrangements provided.

3.7.8 Arrangements to prevent tripping are to be fitted on deep webs.

3.7.9 The deck plating and supporting structure are to be suitably reinforced in way of cranes, masts, and deck equipment or machinery.

3.7.10 Deck structures subject to concentrated loads, are to be suitably reinforced. Where concentrations of loading on one side of a stiffening member may occur, such as out of line pillars, the member is to be adequately stiffened against torsion. Additional reinforcements may be required in way of localised areas of high stress.

3.7.11 The end connection of strength deck longitudinals to bulkheads are to provide adequate fixity and, so far as is practicable, direct continuity of longitudinal strength. For NS1 and NS2 ships, the strength deck longitudinals are to be continuous through transverse structure, including bulkheads, but alternative arrangements will be considered.

3.7.12 Transverses supporting deck longitudinals are, in general, to be spaced not more than 2,5 m apart in NS1 and NS2 ships, and 1,5 m in NS3 ships. They are to be aligned with primary side structure.

3.7.13 All openings are to be supported by an adequate framing system, pillar bulkheads or cantilevers. When cantilevers are used, the scantlings are to be determined by direct calculation.

3.7.14 Where stiffening members terminate in way of an opening they are to be attached to carlings, girders, transverses or coaming plates, in such a way as to minimise stress concentrations.

3.7.15 Other openings in the strength deck outside the line of major openings are to be kept to the minimum number consistent with operational requirements. Openings are to be arranged clear of other opening corners and, so far as possible, clear of one another. Where necessary, plate panels in which openings are cut are to be adequately stiffened against compression and shear buckling. The corners of all openings are to be well rounded and the edges smooth. Attention is to be paid to structural continuity and abrupt changes of shape, section or thickness are to be avoided.

3.7.16 Gutterway bars and spurn waters at the upper deck are to be so arranged that the effect of main hull stresses on them is minimised and that they do not cause stress concentrations in the deck or sheerstrake, see *also* Pt 6, Ch 3,3.6.

3.7.17 It is recommended that the working areas of the weather deck have an anti-slip surface. Working areas of all decks where there is the possibility of leakage of fuel, hydraulic or other oils are to be provided with anti-slip deck coatings, or equivalent, and guard rails, as appropriate.

3.7.18 Where decks are sheathed with wood or other materials, details of the method of attachment are to be submitted, see *also* Part 6.

3.7.19 Where large or novel hatch openings are proposed, detailed calculations are to be submitted to demonstrate that the scantlings and arrangements in way of the openings are adequate to maintain continuity of structural strength.

3.7.20 Where large side shell openings, such as side aircraft lifts, are proposed, detailed calculations are to be submitted.

3.7.21 Pipe or cable runs through watertight decks are to be fitted with suitable watertight glands of a type, approved and pressure tested for the maximum head of water indicated by any required damage stability calculations.

3.7.22 The Naval Authority may require type approval of all watertight deck penetration glands to a nominated standard.

3.7.23 Doors and hatches fitted in watertight decks are to be of equivalent construction to the deck in which they are fitted, be permanently attached and capable of being closed watertight from both sides of the deck except for access to high security areas such as magazines or to prevent access from open decks as agreed with the Naval Authority. They are to be tested watertight in accordance with the LR survey procedures.

3.8 Deep tank structure

3.8.1 The scantlings of deep tank structure are to be in accordance with the relevant Sections of Part 6.

3.8.2 Above the top of floors, the side shell structure of deep tanks is to be effectively supported by a system of primary framing with web frames, stringers, cross ties and/or perforated flats.

3.8.3 The maximum spacing of side shell transverses in longitudinally framed deep tanks is generally not to exceed 2,5 m in NS1 and NS2 ships, and 1,5 m in NS3 ships.

3.8.4 The maximum spacing of side shell web frames in transversely framed deep tanks is generally not to exceed five frame spaces. They are to extend from the tank top to the level of the lowest deck above the design waterline.

3.8.5 The maximum spacing of horizontal stringers is generally not to exceed 3,0 m.

3.8.6 Where decks terminate at deep tanks suitable scarfing arrangements are to be arranged and the side shell supported by a stringer at deck level. The stringer can be either fully effective or acting as part of a grillage. Bulkhead stiffeners are to be supported at the deck level against tripping.

3.8.7 A centreline bulkhead is, generally, to be fitted in deep tanks which extend from side to side. The bulkhead may be intact or perforated as desired. If intact, the scantlings are to comply with the requirements of Part 6 for tank boundary bulkheads. If perforated, they are to comply with the requirements of Part 6 for wash plates. Where brackets from horizontal girders on the boundary bulkheads terminate at the centreline bulkhead, adequate support and continuity are to be maintained.

3.8.8 The thickness of any longitudinal bulkheads may be required to be increased to ensure compliance with the shear strength requirements of Part 6. In the case of a centreline or perforated wing bulkhead, the proportion of the total shear force absorbed by the bulkhead will be specially considered.

3.8.9 The thickness of plating of wash bulkheads may also be required to be increased to take account of shear buckling.

3.8.10 Where longitudinal wash bulkheads support bottom transverses, the lower section of the bulkhead is to be kept free of non-essential openings for a depth equal to 1,75 times the depth of the transverses. The plating is to be assessed for local buckling requirements.

Section 4 Bulkhead arrangements

4.1 General

4.1.1 Watertight bulkheads for NS2 and NS3 ships are, in general, to extend to the uppermost continuous deck, and their construction is to be in accordance with Pt 6, Ch 3,9. In the larger multidecked NS1 ships (e.g. Aircraft Carriers) the watertight bulkheads are generally to extend to the lowest continuous vertical limit of weathertightness determined by 1.3.

4.1.2 Certain openings below the deck given in 4.1.1 may be permitted by the relevant stability and subdivision standard, but these must be kept to a minimum and provided with means of closing to watertight standards.

4.1.3 No accesses are to be fitted in collision bulkheads. In particular designs where it would be impracticable to arrange access to the fore peak other than through the collision bulkhead, access may be permitted if acceptable to the Naval Authority. Where accesses are provided, the openings are to be as small as practicable and positioned as far above the design waterline as possible. In such cases access is to be by manholes with closely spaced bolts situated as high as possible above the design waterline and, in any event, no lower than the damage control deck.

4.1.4 Where openings are permitted in bulkheads they are to be provided with suitable closing devices in accordance with Ch 4,7.

4.1.5 Bulkheads forming the boundaries to citadels and zones as defined in Pt 4, Ch 1,7 other than watertight bulkheads, are usually required by the Naval Authority to be gastight. See also 4.8. Where specifically required by the Naval Authority, LR can assess the gastight integrity of defined gastight boundaries, see Pt 6, Ch 6,6.8.

4.1.6 Pipe or cable runs through watertight bulkheads are to be fitted with suitable watertight glands of a type, approved and pressure tested for the maximum head of water indicated by any required damage stability calculations.

4.1.7 The Naval Authority may require type approval of all watertight bulkhead penetration glands to a nominated standard.

4.1.8 Partial or main bulkheads are to be located beneath the ends of superstructures and deckhouses and masts and heavy items of equipment such as weapon systems to support and transmit the static and dynamic forces into the hull structure. They are to be of sufficient strength and rigidity to carry the concentrated loads imposed on them and maintain alignment where necessary.

4.2 Number and disposition of watertight bulkheads

4.2.1 In general, the number and disposition of bulkheads are to be arranged to suit the requirements for subdivision, floodability and damage stability, and are to be in accordance with Naval Authority requirements as defined in 1.3.

4.2.2 Main transverse watertight bulkheads are to be spaced at reasonably uniform intervals. Where non-uniform spacing is unavoidable and the length of a compartment is unusually large, the transverse strength of the ship is to be maintained by fitting of web frames, increased framing, etc. Details of the proposed arrangements are to be submitted.

4.2.3 All ships are to have a collision bulkhead, an after peak bulkhead and a watertight bulkhead at each end of all main and auxiliary machinery spaces. Additional watertight bulkheads are to be fitted so that the total number of bulkheads is at least in accordance with Table 2.4.1.

4.2.4 Proposals to dispense with one or more of these bulkheads will be considered, subject to suitable structural compensation, if they interfere with the operational requirements.

4.2.5 A main transverse bulkhead is to be located at the position where the ship sues during docking.

Table 2.4.1 Minimum number of bulkheads

Length, L_R , in metres	Total number of bulkheads	
	Machinery amidships	Machinery aft see Note
$L_R \leq 65$	4	3
$65 < L_R \leq 85$	4	4
$85 < L_R \leq 90$	5	5
$90 < L_R \leq 105$	5	5
$105 < L_R \leq 115$	6	5
$115 < L_R \leq 125$	6	6
$125 < L_R \leq 145$	7	6
$145 < L_R \leq 165$	8	7
$165 < L_R \leq 190$	9	8
$L_R > 190$	To be considered individually	
NOTE With after peak bulkhead forming after boundary of machinery space.		

4.3 Collision bulkheads

4.3.1 The collision bulkhead is to be positioned as detailed in Table 2.4.2. However, consideration will be given to proposals for the collision bulkhead to be positioned slightly further aft on an arrangement (b) ship, but not more than $0,08L_R$ from the fore end of L_R , provided that the application is accompanied by calculations showing that flooding of the space forward of the collision bulkhead will not result in any part of the bulkhead deck becoming submerged, or any unacceptable loss of stability. The length L_R is as defined in Table 2.4.1.

Table 2.4.2 Collision bulkhead position distance of collision bulkhead aft of fore end of L_R , in metres

Arrangement	Length L_R , in metres	Minimum	Maximum
(a)	≤ 200 > 200	$0,05L_R$ 10	$0,08L_R$ $0,08L_R$
(b)	≤ 200 > 200	$0,05L_R - f_1$ $10\text{m} - f_2$	$0,08L_R - f_1$ $0,08L_R - f_2$
Symbols and definitions $f_1 = G/2$ or $0,015L_R$, whichever is the lesser $f_2 = G/2$ or 3 m, whichever is the lesser $G =$ projection of bulbous bow forward of fore perpendicular, in metres Arrangement (a) A ship that has no part of its underwater body extending forward of the fore perpendicular Arrangement (b) A ship with part of its underwater body extending forward of the fore perpendicular, (e.g. bulbous bow)			

4.3.2 For ships with pronounced rake of stem, the position of the collision bulkhead will be specially considered.

4.4 Aft peak bulkhead

4.4.1 NS1 and, where practicable, NS2 ships, are to have an aft peak bulkhead generally enclosing the sterntube and rudder trunk in a watertight compartment. In twin screw ships where the bossing ends forward of the aft peak bulkhead, the sterntubes are to be enclosed in suitable watertight spaces inside or aft of the shaft tunnels. The stern gland is to be situated in a watertight shaft tunnel or other watertight space separate from the stern tube compartment and of such volume that, if flooded by leakage through the stern gland, the ship will remain fully operational. The arrangement in NS3 ships, and in NS2 ships where it is impracticable to meet the aforementioned conditions, will be specially considered based on the integrity of the gland sealing arrangements and damage stability requirements.

4.5 Height of bulkheads

4.5.1 The collision bulkhead is normally to extend to the uppermost continuous deck or, in the case of a ship with combined bridge and forecastle or a long superstructure which includes a forecastle, to the superstructure deck. However, if a ship is fitted with more than one complete superstructure deck, the collision bulkhead may be terminated at the first deck above the vertical limit of watertight integrity. Where the collision bulkhead extends above the vertical limit of watertight integrity, the extension need only be to weathertight standards.

4.5.2 The aft peak bulkhead may terminate at the first deck above the load waterline, provided that this deck is made watertight to the stern or to a watertight transom floor.

4.5.3 The remaining watertight bulkheads are to extend as required by 4.1.1. In ships of unusual design, the height of the bulkheads will be specially considered.

4.6 Watertight recesses, flats, openings and loading ramps

4.6.1 Watertight recesses in bulkheads are to be avoided whenever possible.

4.6.2 Where watertight bulkhead stiffeners are cut in way of watertight doors in the lower part of a bulkhead, the opening is to be suitably framed and reinforced. Where stiffeners are not cut but the spacing between the stiffeners is increased on account of watertight doors, the stiffeners at the sides of the doorways are to be increased in depth and strength so that the efficiency is at least equal to that of the unpierced bulkhead, without taking the stiffness of the door frame into consideration.

4.6.3 Doors and hatches fitted through watertight bulkheads are to be of equivalent construction to the bulkhead in which they are fitted, be permanently attached and capable of being closed watertight from both sides of the bulkhead. They are to be tested watertight in accordance with the LR Survey Procedures.

4.6.4 In collision bulkheads, any recesses or steps in the bulkhead are to fall within the limits of bulkhead positions given in 4.3.1. If a step occurs above the virtual limit of watertight integrity the deck need also only be to weathertight standards in way of the step, unless the step forms the crown of a tank, in which case the requirements for deep tank structures are to be complied with.

4.6.5 Doors, manholes, permanent access openings or ventilation ducts are not to be cut in the collision bulkhead except as provided for in 4.1.3.

4.6.6 In ships fitted with bow doors, in which a sloping loading ramp forms part of the collision bulkhead above the virtual limit of watertight integrity, that part of the ramp which is more than 2,30 m above the virtual limit of watertight integrity may extend forward of the minimum limit specified in Table 2.4.2. Such a ramp is to be weathertight over its complete length.

4.7 Watertight doors and hatches in watertight subdivision boundaries below the vertical extent of watertight integrity

4.7.1 Watertight doors and hatches are to be constructed under survey and surveyed during installation. Doors are to be capable of being operated when the ship is listed up to 15° either way. Doors and hatches are to be operated under working conditions and tested in place, see Pt 6, Ch 6.

4.7.2 Watertight doors of the sliding type are to be capable of being operated by efficient hand operated gear, both at the door itself and from an accessible position above the vertical limit of watertight integrity. Means are to be provided at the remote operating position to indicate whether the door is open or closed. The lead of shafting is to be as direct as possible and the screw is to work in a gunmetal nut, see also 4.11.1.

4.7.3 Where the doors and hatches are fitted in watertight subdivision boundaries they are to be of equivalent strength to the unpierced division and capable of being closed watertight. Watertight doors and hatches are to be of a type, approved and pressure tested from both sides for the maximum head of water indicated by any required damage stability calculations.

4.7.4 Indicators are to be provided on the bridge, ship command centre or operations room showing whether the doors and hatches are open or closed.

4.7.5 Doors and hatches are to be capable of being operated from both sides of the watertight division and from an accessible position above the vertical limit of watertight integrity. Power operated sliding doors are to be capable of being opened and closed locally by both power and efficient hand operated mechanisms.

4.7.6 Watertight doors which are intended to be used while at sea are to be of the sliding type capable of being remotely closed from the bridge. An audible alarm is to be provided at the door closure. The power, control and indicators are to be operable in the event of main power failure. Particular care is to be paid to minimising the effect of control system failure.

4.7.7 As an alternative to the sliding doors required by 4.7.6, special consideration will be given to the fitting of hinged watertight doors where it can be shown that they are as effective as the sliding type. A suitable system is to be operated to ensure that such doors remain closed when operating at an increased risk of collision or grounding.

4.7.8 Hinged weathertight doors may be fitted above the vertical limit of watertight integrity. Doors are to be manufactured in accordance with a National Standard and tested following installation, see Pt 6, Ch 6.

4.8 Gastight bulkheads

4.8.1 Where an assessment of gastight integrity is required the scantlings of gastight bulkheads are to be in accordance with Part 6.

4.8.2 Where bulkheads are required to be gastight and where it is proposed to pierce such bulkheads for the passage of cables, pipes, vent trunking, etc., gastight glands are to be provided to maintain the gastight integrity.

4.9 Tank bulkheads

4.9.1 For bulkheads in way of partially filled compartments or tanks, sloshing forces may be required to be taken into account. Where such forces are likely to be significant, the scantlings will be required to be verified by additional calculations.

4.9.2 The scantlings of deep tank bulkheads are to be in accordance with Part 6.

4.9.3 Air and sounding pipes are to comply with the requirements of Pt 3, Ch 4,6.

4.10 Cofferdams

4.10.1 Tanks carrying oil fuel or lubricating oil are to be separated by cofferdams from those carrying fresh water. Cofferdams are to be fitted between freshwater tanks and black or grey water tanks.

4.10.2 Lubricating oil tanks are also to be separated by cofferdams from those carrying oil fuel unless:

- Common boundaries of lubricating oil and oil fuel tanks have full penetration welds.
- The tanks are arranged such that the oil fuel tanks are not generally subjected to a head of oil in excess of that in the adjacent lubricating oil tanks.

4.10.3 If oil fuel tanks are necessarily located within or adjacent to the machinery spaces, their arrangement is to be such as to avoid direct exposure of the bottom from rising heat resulting from a machinery or hazardous space fire.

4.10.4 Adequate access is to be provided to all parts of the cofferdams for future maintenance, surveys and repairs. The edges of openings are to be smooth.

4.11 Watertight tunnels and passageways

4.11.1 Sterntubes are to be enclosed in watertight spaces of moderate volume. In addition, arrangements are to be made to minimise the danger of water penetrating into the ship in case of damage to the stern tube in accordance with the requirements of the Naval Authority. Normally the stern gland is to be situated in a watertight shaft tunnel or other watertight space separate from the stern tube compartment and of such volume that, if flooded by leakage through the stern gland, the vertical limit of watertight integrity, see 1.3, will not be submerged.

4.12 Means of escape

4.12.1 The arrangement of the hull is to be such that all under deck compartments are as accessible as practicable and provided with a satisfactory means of escape in accordance with a recognised Naval Authority. Access and escape hatches to the machinery and tanks are not to be obstructed by deck coverings or furniture.

4.13 Carriage of low flash point fuels

4.13.1 For ships having oil fuel with a flash point below 60°C the arrangement for the storage, distribution and utilisation of the oil fuel are to be such that the safety of the ship and persons on board is preserved, having regard to the fire and explosion hazards. See Vol 2, Pt 7, Ch 3,2.

Section 5 Fore and aft end arrangements

5.1 General

5.1.1 In general the main hull structural arrangements as defined in 3.3 are to extend as far forward and aft as possible.

5.1.2 The requirements of this Section apply to the fore and aft ends and relate to structure situated in the region forward of $0,7L_R$ and aft of $0,3L_R$ respectively.

5.1.3 Certain ships will require additional strengthening for bottom forward slamming and bow flare slamming. The scantlings of the hull structure forward are to be determined from Part 6, using the loads specified in Pt 5, Ch 3,3.

5.1.4 Where the stern overhang is significant, or large masses are placed on the stern, the strength of the aft end structure will be specially considered, see Ch 5,10.2.

5.2 Structural continuity

5.2.1 The Rules provide for both longitudinal and transverse framing systems.

5.2.2 Where the shell, deck and inner bottom are longitudinally framed in the midship region, this system of framing is to be carried forward and aft as far as possible.

5.2.3 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and as far as practicable, direct continuity of longitudinal strength, see also Section 3.

5.2.4 Suitable scarfing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt structural changes.

5.2.5 Where longitudinal framing terminates and is replaced by a transverse system, adequate arrangements are to be made to avoid an abrupt changeover. Where a forecastle is fitted extending forward from $0,85L_R$, longitudinal framing at the upper deck and topsides is generally to be continued forward of the aft bulkhead of this superstructure.

5.2.6 Where a superstructure or poop is fitted extending forward of $0,15L_R$, longitudinal framing at the upper deck and topsides is generally to be continued aft of the forward bulkhead of this superstructure.

5.2.7 The forecastle side plating may be a continuation of the side shell plating or fitted as a separate assembly. The side plating is to be stiffened by side frames effectively connected to the deck structure. Deep webs are to be fitted to ensure overall rigidity.

5.2.8 Forecastles and bulwarks are to be constructed in accordance with the scantlings indicated in Pt 6, Ch 3,11.

5.3 Minimum bow height and extent of forecastle

5.3.1 The requirements regarding minimum bow height given in 5.3.2 are to be complied with. Only in exceptional circumstances and in specialist ships will any relaxation be given to this requirement where it interferes with the safe operation of the vessel. In such cases due consideration is to be given to the clearing of seawater from the forecastle deck. The effects on strength and stability are also to be considered.

5.3.2 All sea-going ships are to be fitted with forecastles, or increased sheer on the upper deck or equivalent, such that the distance from the waterline design draught to the top of the exposed deck at side at the F.P. is not less than:

$$H_b = \left(6075 \left(\frac{L_R}{100} \right) - 1875 \left(\frac{L_R}{100} \right)^2 + 200 \left(\frac{L_R}{100} \right)^3 \right) \times \left(2,08 + 0,609C_b - 1,603C_{wf} - 0,0129 \left(\frac{L_R}{d_1} \right) \right)$$

where

C_b = block coefficient, not to be less than 0,68

L_R = Rule Length, in metres

H_b = minimum bow height, in mm

d_1 = draught at 85 per cent of the depth, D , see Ch 1,5.2.10

C_{wf} = waterplane area coefficient forward of midships $A_{wf}/\{(L_R/2) \times B\}$

B = moulded breadth, in metres

A_{wf} = is the forward waterplane area at draught d_1 , in m².

5.3.3 Ships which are designed to suit exceptional operational requirements, restricted in their service to service area **SA4**, or of novel configuration will be specially considered on the basis of the Rules.

5.3.4 Where the bow height required in 5.3.2 is obtained by increased sheer, the sheer shall extend for at least 15 per cent of the length of the ship measured abaft the forward end of L_R . Where it is obtained by fitting a forecastle, the forecastle shall extend from the stem to a point at least $0,07L_R$ abaft the forward end of L_R .

5.4 Bow crumple zone

5.4.1 In general the bow crumple zone is that space forward of the collision bulkhead. Embarked personnel or crew accommodation and the carriage of fuel, hazardous materials and other oils is not permitted in the bow crumple zone.

5.5 Deck structure

5.5.1 The scantlings of the deck structure are to comply with Pt 6, Ch 3,10.

5.5.2 The deck plating thickness and supporting structure are to be suitably reinforced in way of anchor windlass, other deck machinery, and in way of cranes, masts or derrick posts, RAS stump masts, and weapon launching positions, etc.

5.5.3 Where large openings are arranged at lower decks near the side shell, it may be necessary to increase the adjacent deck structure to ensure effective support for side framing.

5.5.4 In NS1 and NS2 ships, on decks aft of the after cut-up, deep beams are generally to be fitted in way of web frames. Deck girders are generally to be spaced not more than 3,0 m apart and integrated with the primary structure forward.

5.5.5 Requirements for the arrangement and geometry of deck openings are given in 3.1 and 3.7. The scantlings of any inserts required are to be in accordance with Part 6.

5.6 Shell envelope plating and framing

5.6.1 The scantlings of bar keels in the forward end are to be the same as that required in the midship region, see Table 3.2.1 in Pt 6, Ch 3.

5.6.2 The thickness and width of plate keels in the forward region are to be the same as that required in the midship region.

5.6.3 The scantlings of plate stems are to be determined from Pt 6, Ch 3.5. Plate stems are to be supported by horizontal diaphragms positioned in line with the side stringers or perforated flats with intermediate breasthook diaphragms. Diaphragms are to be spaced not more than 1,5 m apart, measured along the stem. Where the stem plate radius is large, a centreline stiffener or web will be required.

5.6.4 The thickness of side shell and sheerstrake plating in the forward region is to be not less than the values required by Pt 6, Ch 3.5, but may be required to be increased locally on account of high shear forces, in accordance with Pt 6, Ch 4.3.2.

5.6.5 The shell plating may be required to be increased in thickness locally in way of openings such as hawse pipes and sonar domes, where fitted.

5.6.6 The shell plating is to be increased in thickness locally in way of a bulbous bow, see 5.10.

5.6.7 Sea inlet and other openings are to be in accordance with 3.3.6.

5.6.8 The bottom longitudinals are to be continuous in way of both watertight and non-watertight floors.

5.6.9 Where the shape of the after hull is such that there are large flat areas, particularly in the vicinity of the propellers, additional primary supports for the secondary stiffening may be required. Their extent and scantlings will be specially considered.

5.7 Single and double bottom structure

5.7.1 The general requirements of 3.5 and 3.6 apply.

5.7.2 The minimum depth of centre girder forward is generally to be the same as that required in the midship region.

5.7.3 Where the height of the double bottom varies, structural continuity is to be maintained. An inner bottom where fitted is to be gradually sloped over an adequate longitudinal extent. Knuckles in the plating are to be arranged close to plate floors. Otherwise, suitable scarfing arrangements are to be made.

5.7.4 For ships of full form, in fore peak and deep tank spaces, the floors and bottom transverses are to be supported by a centreline girder or a centreline wash bulkhead. In other cases the centreline girder is to be carried as far forward as practicable. The floor panels and the upper edges of the floors and centreline girder are to be suitably stiffened.

5.7.5 In aft peak spaces, floors are to be arranged at every frame. For details and scantlings, see Pt 6, Ch 3.7.

5.7.6 Provision is to be made for the free passage of water and air from all parts of single or double bottoms as required by 3.1.17 to 3.1.21.

5.8 Fore peak structure

5.8.1 The requirements given in this Section apply to the arrangement of primary structure supporting the fore peak side shell and bulbous bow, the arrangement of wash bulkheads and perforated flats. The scantlings of structure in the fore peak is to be in accordance with the relevant Sections of Part 6.

5.8.2 The bottom of the peak space is generally to be transversely framed. Longitudinally framed bottom structure will be specially considered.

5.8.3 Above the floors, transverse side framing is to be supported by horizontal side stringers, cross ties and/or perforated flats.

5.8.4 Suitable transverses or deep beams are to be arranged at the top of the tank and at perforated flats to provide end rigidity to the side transverses.

5.8.5 Wash bulkheads are to have an area of perforations not less than five per cent nor more than 10 per cent of the area of the bulkhead. The plating is to be suitably stiffened in way of openings. Stiffeners are to be bracketed at top and bottom.

5.9 Aft peak structure

5.9.1 The scantlings of aft peak structure are to be as required by the relevant sections of Part 6. The plating thickness is to be increased locally in way of the sterntube gland.

5.9.2 Floors are to be arranged at every frame space and are to be carried to a suitable height, and at least to above the stern tube, where fitted. Floors are to be adequately stiffened. In way of propeller shaft brackets, rudder post or rudder horn, the floors are generally to be carried to the top of the space and are to be of increased thickness. The extent and amount of the increase will be specially considered, account being taken of the arrangements proposed.

5.9.3 Above the floors, transverse side framing is to be supported by horizontal stringers, cross ties and/or perforated flats.

5.9.4 Suitable transverses or deep beams are to be arranged at the top of the tank to provide end rigidity to the side transverses.

5.9.5 A centreline wash bulkhead is to be arranged in the upper part of the aft peak space. Additional wash bulkheads are to be fitted port and starboard where the width of the tank exceeds 20 m.

5.9.6 The plating is to be suitably stiffened in way of openings, and the arrangement of openings is to be such as to maintain adequate shear rigidity.

5.9.7 The position and height of the after peak bulkhead are to be in accordance with the requirements of 4.4.

5.9.8 Centre and side girders where fitted are to be bracketed to the transom framing members by substantial knees. Hard spots are to be avoided in way of the end connections and care is to be taken to ensure that the stiffening member to which the transom knee is attached can satisfactorily carry the load.

5.10 Bulbous bows

5.10.1 Where a bulbous bow is fitted, the structural arrangements are to be such that the bulb is adequately supported and integrated into the fore peak structure.

5.10.2 At the fore end of the bulb the structure is generally to be supported by horizontal diaphragm plates spaced generally 1,0 m apart in conjunction with a deep centreline web.

5.10.3 In general, vertical transverse diaphragm plates are to be arranged in way of the transition from the peak framing to the bulb framing.

5.10.4 In way of a wide bulb, additional strengthening in the form of a centreline wash bulkhead is generally to be fitted.

5.10.5 In way of a long bulb, additional strengthening in the form of transverse wash bulkheads or substantial web frames spaced about five frame spaces apart are generally to be fitted.

5.10.6 The shell plating is to be increased in thickness at the fore end of the bulb and in other areas likely to be damaged by the anchors and chain cables. The increased plate thickness is to be the same as that required for plated stems.

Section 6 Machinery space arrangements

6.1 General

6.1.1 Requirements particular to machinery spaces, including protected machinery casings and engine seatings only, are given in this Section. For other scantlings and arrangement requirements, see the relevant Section in this Chapter.

6.1.2 Requirements for the scantlings of structure in machinery spaces are to be in accordance with the relevant sub-Sections of Pt 6, Ch 3,13.

6.1.3 In addition, the requirements of Vol 2, Pt 1, Ch 2,5.1.4 to 5.1.6 are to be complied with.

6.2 Structural configuration

6.2.1 Requirements are given for ships constructed using either a transverse or longitudinal framing system, or a combination of the two.

6.2.2 Machinery space stiffening is generally to be arranged in the same manner as structure immediately forward and aft of the space. For NS1 and NS2 ships this will generally be longitudinal. Machinery spaces adjacent to the aft peak bulkhead may be constructed using a transverse framing system or a combination of longitudinal and transverse.

6.3 Structural continuity

6.3.1 Suitable scarfing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt discontinuities where structure which contributes to the main longitudinal strength of the ship is omitted in way of a machinery space.

6.3.2 Where the longitudinal framing terminates and is replaced by transverse framing, a suitable scarfing arrangement of the longitudinal framing is to be arranged.

6.4 Deck structure

6.4.1 The corners of machinery space openings are to be of suitable shape and design to minimise stress concentrations.

6.4.2 Where a transverse framing system is adopted, deck beams are to be supported by a suitable arrangement of longitudinal girders in association with pillars or pillar bulkheads. Deep beams are to be arranged in way of the ends of engine casings and also in line with side web frames where fitted.

6.4.3 Where a longitudinal framing system is adopted, deck longitudinals are to be supported by deck transverses in association with pillars or pillar bulkheads. The maximum spacing of transverses is given in 6.5.2. Deck transverses are to be in line with side transverses or web frames.

6.4.4 Machinery casings are to be supported in accordance with the requirements of 6.7.

6.4.5 The scantlings of lower decks or flats are generally to be as given in Pt 6, Ch 3, 10. However, in way of concentrated loads such as those from boiler bearers or heavy auxiliary machinery, etc., the scantlings of deck structure will be specially considered, taking account of the actual loading.

6.4.6 In way of machinery space openings, etc., particularly towards the aft end, decks or flats are to have sufficient strength where they are intended to provide effective primary support to side framing, webs or transverses.

6.4.7 Where decks terminate at a machinery space bulkhead, suitable scarfing arrangements are to be arranged. The side shell of the machinery space is generally to be supported by a stringer at deck level. The stringer can be either fully effective or acting as part of a grillage. Bulkhead stiffeners at the deck level are to be supported against tripping.

6.4.8 Machinery space bulkheads with no supporting decks are to have suitable primary stiffening similar to that provided for the side shell in 6.5.

6.5 Side shell structure

6.5.1 The side shell structure of machinery spaces is to be effectively supported by a system of primary framing with web frames and stringers. General requirements for web frames are given in this Section for both longitudinal and transverse framing systems.

6.5.2 The maximum spacing of side shell transverses in longitudinally framed machinery spaces is generally not to exceed 2,5 m in NS1 and NS2 ships, and 1,5 m in NS3 ships.

6.5.3 The maximum spacing of side shell web frames in transversely framed machinery spaces is generally not to exceed five frame spaces. They are to extend from the tank top to the level of the lowest deck above the design waterline.

6.5.4 The maximum spacing of stringers is generally not to exceed 3,0 m.

6.6 Double and single bottom structure

6.6.1 For the required extent of double bottom structure, see 3.6.

6.6.2 In the bottom structure sufficient fore and aft girders are to be arranged in way of the main machinery to effectively distribute its weight and to ensure adequate rigidity of the structure. In midship machinery spaces these girders are to extend for the full length of the space and are to be carried aft to support the foremost shaft tunnel bearing. This extension beyond the after bulkhead of the machinery space is to be for at least three transverse frame spaces, aft of which the girders are to scarf into the structure. Forward of the forward machinery space bulkhead, the girders are to be tapered off over three frame spaces and effectively scarfed into the structure. In machinery spaces in the aft end of the ship the girders are to be carried as far aft as practicable and the ends effectively supported by web frames or transverses. Care is to be taken to avoid any abrupt changes or discontinuities.

6.6.3 Where, in NS3 ships, the bottom is transversely framed, plate floors are to be fitted at every frame in the machinery space and under the main machinery, rafts, seatings and thrust bearing.

6.6.4 Where the bottom is longitudinally framed, plate floors are to be fitted at a maximum spacing of 2,5 m in NS1 and NS2 ships, and 1,5 m in NS3 ships in the machinery space under the main machinery, rafts, seatings and thrust bearing.

6.6.5 The minimum depth of the centre girder and its thickness are to be at least the same as required in way of other spaces amidships. Where the height of inner bottom in the machinery spaces differs from that in adjacent spaces, continuity of longitudinal material is to be maintained. In ships with a double bottom it is to be achieved by sloping the inner bottom over an adequate longitudinal extent. The knuckles in the plating are to be arranged close to plate floors.

6.6.6 Margin plates and drainage wells are to be provided as necessary and will be subject to special consideration.

6.6.7 Suitable arrangements are to be made to provide free passage of water from all parts of the bilge to the pump suctions. General requirements are given in 3.1.17 to 21.

6.6.8 Watertight floors, or floors forming boundaries of tank spaces, are also to comply with 6.8.

6.6.9 Where practicable side girders outboard of the engines are to be fitted and are to line up with the side girders in adjacent spaces.

6.7 Machinery casings

6.7.1 The scantlings and arrangements of exposed casings protecting machinery openings are to be in accordance with Pt 6, Ch 3, 11.

6.7.2 Where casing sides act as girders supporting decks over, care is to be taken that access openings do not seriously weaken the structure. Openings are to be effectively framed and reinforced if necessary. Particular care is to be paid to stiffening where the casing supports the funnel or exhaust uptakes.

6.7.3 Machinery casings are to be supported by a suitable arrangement of deep beams or transverses and longitudinal girders in association with pillars or pillar bulkheads. In way of particularly large machinery casing openings, cross ties may be required, and these are to be arranged in line with deep beams or transverses. Where casing stiffeners carry loads from deck transverses, girders, etc., or where they are in line with pillars below, they are to be suitably reinforced.

6.7.4 Casing bulkheads are to be made gastight and the access doors are to be of a gastight self-closing type.

6.8 Integral fuel tanks

6.8.1 The scantlings of deep tank bulkheads are to be in accordance with Pt 6, Ch 3,9.

6.8.2 Oil fuel tanks situated within the machinery space are generally to comply with the requirements given in Part 6.

6.9 Machinery seatings

6.9.1 Requirements on the scantlings of structure for machinery seatings is given in Pt 6, Ch 3,13.

6.9.2 This Section applies to machinery or machinery raft seatings that are directly supported by the ship's hull. They are to be effectively secured to the hull and to be of adequate scantlings to resist the various gravitational, thrust, torque, dynamic and vibratory forces which may be imposed on them. Due attention is to be paid to the stiffness requirements of the machinery or raft supported.

6.9.3 Seatings are to be of substantial construction and efficiently supported by transverse and horizontal brackets or gusset plates. These should generally be arranged in line with plate floors and girders in a double bottom or with suitable deep beams or transverses and girders at upper decks. Where applicable seats are to be designed to ensure proper alignment with gearing and allow for thermal expansion effects.

6.9.4 In general seats are not to be arranged in way of breaks or recesses in the bottom structure.

6.9.5 Main machinery or raft holding-down bolts are to be arranged as near as practicable to floors and longitudinal girders. When this cannot be achieved, additional floors are to be fitted.

6.9.6 Auxiliary machinery is to be secured on seating of adequate scantlings, so arranged as to distribute the loadings evenly into the supporting structure.

Section 7 Superstructures, deckhouses, bulwarks, sponsons and appendages

7.1 General

7.1.1 Superstructures, deckhouses, forecastles and bulwarks are to be constructed in accordance with the scantlings indicated in Pt 6, Ch 3,11.

7.1.2 For requirements relating to companionways, doors, accesses and skylights, see Chapter 4.

7.1.3 Requirements for machinery casings are given in 6.7.

7.1.4 For closing arrangements and outfit the requirements are given in Chapter 4.

7.2 Definitions

7.2.1 The term 'house' is used to include both superstructures and deckhouses.

7.2.2 The lowest, or first tier of a house, is normally that which is directly situated on the deck to which, D , is measured. The second tier is the next tier above the lowest tier and so on.

7.3 Structural requirements

7.3.1 The plating and supporting structure are to be suitably reinforced in way of localised areas of high stress such as corners of openings, cranes, masts, equipment, fittings and other heavy or vibrating loads.

7.3.2 Structures subject to concentrated loads are to be suitably reinforced. Where a concentration of loading on one side of a stiffener may occur, such as pillars out of line, the stiffener is to be adequately stiffened against torsion.

7.3.3 Primary stiffening members are to be continuous and substantially bracketed at their end connections to maintain continuity of structural strength.

7.3.4 Secondary stiffening members are to be effectively continuous and bracketed at their end connections as appropriate.

7.3.5 Transverse rigidity is to be maintained throughout the length of the house by means of web frames, bulkheads or partial bulkheads. Particular care is to be paid when an upper tier is wider than its supporting tier and when significant loads are carried on the house top.

7.3.6 Web frames or partial bulkheads are to be fitted in line with bulkheads or deep primary stiffeners below.

7.3.7 Special attention is to be given to the connection of the erection to the deck in order to provide an adequate load distribution and avoid stress concentrations. The house stiffening is to align with main hull stiffening wherever possible.

7.3.8 Where aluminium erections are arranged above a steel hull, details of the arrangements in way of the bimetallic connections are to be submitted.

7.3.9 Adequate support under the ends of houses is to be provided in the form of webs, pillars and diaphragms or bulkheads in conjunction with reinforced deck beams. At the corners of houses and in way of supporting structures attention is to be given to the connection to the decks and inserts or equivalent arrangements should generally be fitted.

7.4 Openings

7.4.1 All openings are to be substantially framed and have well rounded corners. Arrangements are to be made to minimise the effect of discontinuities in houses. Continuous coamings or girders are to be fitted below and above doors and similar openings. House tops are to be strengthened in way of davits and cranes.

7.4.2 Particular care is to be paid to the effectiveness of end bulkheads and the upper deck stiffening in way when large openings are fitted.

7.4.3 Special care is to be taken to minimise the size and number of openings in the sides or longitudinal bulkheads of houses which end within $0,25L_R$ to $0,75L_R$. Account is to be taken of the high vertical shear loading which can occur in these areas.

7.4.4 Windows, ventilators and other superstructure openings are to be suitably framed and mullions will in general be required.

7.5 Effective structure

7.5.1 For ships where L_R exceeds 40 m or for designs where the superstructure is designed to absorb global loads the effectiveness of superstructures to carry these loads is to be determined. The effectiveness may be assessed in accordance with Pt 6, Ch 4,2.5.

7.5.2 When large openings or a large number of smaller openings are cut in the superstructure sides, reducing the capability to transmit shear force between decks, an assessment of structural efficiency may be required. The scantlings of the side structure in way of these areas may also be required to be increased.

7.6 Sponsons and appendages

7.6.1 Primary structure supporting sponsons is to be effectively integrated into the main hull structure. This is to be achieved by extending the primary framing system or by suitable scarfing the sponson primary structure over at least five frame spaces.

7.6.2 The scantlings of sponson structure are to be as required by the relevant parts of Part 6, for decks or side shell. Decks used for aircraft operations or wheeled vehicles are to comply with Part 4 and Part 6 respectively.

7.6.3 Where sponsons are located outside of $0,4L_R$ amidships and extend outside of the waterline breadth, B_{WL} , of the ship the effects of wave impacts are to be considered. The loads are to be derived in accordance with the bow flare slamming requirements in Pt 5, Ch 3,3.

7.6.4 The strength and arrangement of large bilge keels, stabilisers and other protrusions that may impinge on icebergs or flows are to be specially considered. In some cases the speed for operation in ice may be restricted.

7.7 Unusual designs

7.7.1 Ships or structural arrangements which are of unusual design, form or proportions will be individually considered.

■ **Section 8** **Pillars and pillar bulkheads**

8.1 General

8.1.1 Pillars and pillar bulkheads are to be constructed in accordance with the scantlings indicated in Pt 6, Ch 3,12.

8.1.2 Pillars are to be arranged to transmit loads from decks and superstructures into the bottom structure. Pillars are generally to be constructed from solid, tubular or I beam section. A pillar may be a fabricated trunk or partial bulkhead.

8.2 Head and heel connections

8.2.1 Pillars are to be attached at their heads to plates supported by efficient brackets, in order to transmit the load effectively. Doubling or insert plates are to be fitted to decks under large pillars and to the inner bottom under the heels of tubular or hollow square pillars. The pillars are to have a bearing fit and are to be attached to the head and heel plates by continuous welding. At the heads and heels of pillars built of rolled sections, the load is to be well distributed by means of longitudinal and transverse brackets.

8.3 Alignment and arrangement

8.3.1 Pillars are to be located on main structural members. They are in general to be fitted below windlasses, winches, capstans, the corners of deckhouses, large items of equipment and elsewhere where considered necessary.

8.3.2 Wherever possible, deck pillars are to be fitted in the same vertical line as pillars above and below, and effective arrangements are to be made to distribute the load at the heads and heels of all pillars.

8.3.3 Where pillars support eccentric loads, or are subjected to lateral pressures, they are to be suitably strengthened for the additional bending moment imposed upon them.

8.3.4 Doublers are generally to be fitted on decks and inner bottoms, other than within tanks where doublers are not allowed. Brackets or insert plates may be used instead of doublers.

8.3.5 In double bottoms under widely spaced pillars, the connections of the floors to the girders, and of the floors and girders to the inner bottom, are to be suitably increased. Where pillars are not directly above the intersection of plate floors and girders, partial floors and intercostals are to be fitted as necessary to support the pillars. Holes are not to be cut in the floors and girders below the heels of pillars. Where longitudinal framing is adopted in the double bottom, equivalent stiffening under the heels of pillars is to be provided, and where the heels of pillars are carried on a tunnel, suitable arrangements are to be made to support the load.

8.4 Pillars in tanks

8.4.1 In no circumstances are pillars to pass through tanks. Where loads are to be transmitted through tanks, pillars within the tanks are to be carefully aligned with the external pillars. The tensile stress in the pillar and its end connections is not to exceed 108 N/mm^2 at the tank test pressure. Such pillars are in general to be of built sections and end brackets may be required.

8.5 Fire aspects

8.5.1 Pillars and pillar bulkheads are to be suitably protected against fire, and capable of resisting fire damage. They are not to be constructed of aluminium.

Section

- 1 **General**
- 2 **Rudders**
- 3 **Stabiliser arrangements**
- 4 **Rudder horns and appendages**
- 5 **Fixed and steering nozzles, bow and stern thrust units, ducted propellers**
- 6 **Waterjet propulsion systems**

■ Section 1 General

1.1 Application

1.1.1 This Chapter applies to all of the ships detailed in the Rules, and requirements are given for rudders, stabilisers, and appendages, nozzles, steering gear, bow and stern thrust unit structure and waterjet propulsion systems. For podded propulsion systems, see Vol 2, Pt 4, Ch 4.

1.2 General

1.2.1 The following symbols and definitions are applicable to this Chapter, unless otherwise stated:

σ_o = minimum yield stress or 0,5 per cent proof stress of the material, in N/mm² and is not to be taken greater than $0,7\sigma_u$ or 450 N/mm², whichever is the lesser

where

σ_u = ultimate tensile strength of the material, in N/mm².

1.3 Navigation in ice

1.3.1 Where an ice class notation is to be included in the class of a ship, the requirements of Pt 5, Ch 2,4 are to be complied with.

1.4 Materials

1.4.1 The requirements for materials are contained in the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

1.4.2 Rudder stocks, pintles, coupling flange bolts, keys and cast parts of rudders are assumed to be made of rolled, forged or cast carbon manganese steel in accordance with the Rules for Materials. Where other materials are proposed the scantlings will require to be specially considered on the basis of the Rules.

1.4.3 For rudder stocks, pintles, keys and bolts the minimum yield stress is not to be less than 200 N/mm². The following requirements are based on a material's yield stress of 235 N/mm². If material is used having a yield stress differing from 235 N/mm² the material factor is to be determined as follows:

$$K_o = \left[\frac{\sigma_o}{235} \right]^m$$

where

$m = 0,75$ for $\sigma_o > 235$ N/mm²

$m = 1,0$ for $\sigma_o \leq 235$ N/mm²

σ_o is as defined in 1.2.1.

1.4.4 In order to avoid excessive edge pressures in way of bearings, rudder stock deformations should be kept to a minimum. Where significant reductions in rudder stock diameter due to the application of steels with yield strengths exceeding 235 N/mm² are proposed, final acceptance may require the evaluation of the rudder stock deformations.

■ Section 2 Rudders

2.1 General

2.1.1 The scantlings of the rudder stock are to be not less than those required by 2.14, 2.15 and 2.16 as appropriate.

2.1.2 For rudders having an increased diameter of rudder stock, see Fig. 3.2.1, the increased diameter is to be maintained to a point as far as practicable above the top of the lowest bearing. This diameter may then be tapered to the diameter required in way of the tiller. The length of the taper is to be at least three times the reduction in radius. Particular care is to be taken to avoid the formation of a notch at the upper end of the taper.

Fig. 3.2.1 Rudder types

2.1.3 Sudden changes of section or sharp corners in way of the rudder coupling, jumping collars and shoulders for rudder carriers, are to be avoided.

2.2 Definition and symbols

2.2.1 Definitions and symbols for use throughout this Section are indicated in the appropriate tables.

2.3 Direct calculations

2.3.1 Where the rudder is of a novel design, high aspect ratio or the speed of the ship exceeds 45 knots the scantlings of the rudder and rudder stock are to be determined by direct calculation methods incorporating model test results and structural analysis, where considered necessary by Lloyd's Register (hereinafter referred to as 'LR').

2.4 Equivalents

2.4.1 Alternative methods of determining the loads will be specially considered, provided that they are based on model tests, full scale measurements or generally accepted theories. In such cases, full details of the methods used are to be provided when plans are submitted for appraisal.

2.5 Rudder arrangements

2.5.1 Rudders considered are the types shown in Fig. 3.2.1, of double plate or single plate construction, constructed from steel. Other rudder types and materials will be subject to special consideration.

2.6 Rudder profile coefficient, K_2

2.6.1 The rudder profile coefficient, K_2 , for use in the determination of rudder force and rudder torque is to be as indicated in Table 3.2.1.

Table 3.2.1 Rudder profile coefficient, K_2

Design criteria (see Fig. 3.2.2)	K_2 ahead condition	K_2 astern condition
Normal profile	1,0	0,97
Hollow profile	1,25	1,12
High lift profile	1,7	To be specifically considered
Symbols		
K_2 = rudder profile coefficient for use in 2.11.1		
NOTE Where a rudder is behind a fixed nozzle, the value of K_2 given above, is to be multiplied by 1,3.		

2.7 Rudder angle coefficient, K_3

2.7.1 The rudder angle coefficient, K_3 , for use in the determination of rudder force and rudder torque is to be as indicated in Table 3.2.2.

Fig. 3.2.2 Rudder profiles

Table 3.2.2 Rudder angle coefficient, K_3

Rudder angle	2 x 35°	2 x 45°
K_3	1,0	1,23
Symbols		
K_3 = rudder coefficient. Intermediate values may be obtained by interpolation		

2.8 Rudder position coefficient, K_4

2.8.1 The rudder position coefficient, K_4 , for use in the determination of rudder force and rudder torque is to be as indicated in Table 3.2.3.

Table 3.2.3 Rudder position coefficient, K_4

Design criteria		K_4
Ahead condition	Rudder out of propeller slipstream	0,8
	Rudder in propeller slipstream	1,0
	Rudder behind fixed propeller nozzle	1,15
Symbols		
K_4 = rudder position coefficient for use in 2.11.1		

2.9 Rudder speed coefficient, K_5

2.9.1 The rudder speed coefficient, K_5 , for use in the determination of rudder force and rudder torque is to be as indicated in Table 3.2.4.

Table 3.2.4 Rudder speed coefficient, K_5

Design criteria	K_5
Ships with $\frac{V}{\sqrt{L_{WL}}} < 3,0$	1,00
Ships with $\frac{V}{\sqrt{L_{WL}}} \geq 3,0$	$(1,12 - 0,005V)^3$
Symbols	
L_{WL} as defined in Ch 1, 5.2.1	
V as defined in 2.11	
K_5 rudder speed coefficient for use in 2.11.1	

Table 3.2.5 Position of centre of pressure

Design criteria	Value of x_{PF} and x_{PA}
Rectangular rudders; (a) Ahead condition	$x_{PF} = (0,33e_h x_B - x_L)$, but not less than $0,12x_B$
(b) Astern condition	$x_{PA} = (x_A - 0,25x_B)$, but not less than $0,12x_B$
Non-rectangular rudders; (a) Ahead condition	x_{PF} and x_{PA} are to be calculated from geometric form (see Note)
(b) Astern condition	but not less than: $\frac{0,12A_R}{y_R}$
Symbols	
x_{PF} = horizontal distance from the centreline of the rudder pintles, or axle, to the centre of pressure in the ahead condition, in metres x_{PA} = horizontal distance from the centreline of the rudder pintles, or axle, to the centre of pressure in the astern condition, in metres x_B = breadth of rudder, in metres y_R = depth of rudder at centreline of stock, in metres A_R = rudder area, in m^2 x_L and x_A = horizontal distances from leading and after edges, respectively, of the rudder to the centreline of the rudder pintles, or axle, in metres x_S = horizontal length of any rectangular strip of rudder geometric form, in metres e_h = hull form factor at ahead condition defined as follows: for $L < 65$ m, $e_h = 1,0$ for $L \geq 65$ m $e_h = 2 \left(C_b + 10 \frac{B_{WL}}{L_R} - 2 \right) \frac{V}{\sqrt{L_R}}$ but not less than 1,0 and need not be taken greater than $1 + \left(\frac{L_R - 65}{70} \right)$ L_R, B and C_b are as defined in Ch 1,5. V is as defined in 2.11.1	
NOTE For rectangular strips the centre of pressure is to be assumed to be located as follows: (a) $0,33x_S$ abaft leading edge of strip for ahead condition. (b) $0,25x_S$ from aft edge of strip for astern condition.	

2.10 Centre of pressure

2.10.1 The position of the centre of pressure for use in the determination of the rudder torque is to be as indicated in Table 3.2.5.

2.11 Rudder force, F_R

2.11.1 The rudder force, F_R , for use in the determination of the rudder scantlings is not to be taken less than that determined from the following formula:

$$F_R = 0,132K_1 K_2 K_3 K_4 K_5 A_R V^2 \text{ kN}$$

where

F_R = rudder force, in kN

K_1 = factor depending on the aspect ratio λ of the rudder area

$$= \frac{(\lambda + 2)}{3} \text{ with } \lambda \text{ not to be taken greater than } 2$$

$$\lambda = \frac{h_r^2}{A_R}, \text{ where } h_r \text{ is the mean height of the rudder}$$

area, in metres. Mean breadth and mean height of rudder are to be determined from Fig. 3.2.3

A_R = area of rudder blade, in m^2

K_2 = rudder profile coefficient, see Table 3.2.1

K_3 = rudder angle coefficient, see Table 3.2.2

K_4 = rudder position coefficient, see Table 3.2.3

K_5 = rudder speed coefficient, see Table 3.2.4

V = maximum design speed for short term high power operations, in knots. When the speed is less than 8 knots, V is to be replaced by the expression:

$$V_{\min} = \frac{(V + 16)}{3} \text{ knots}$$

For the astern condition the maximum astern speed, V_A , is to be used. $V_A \geq 0,5V$ knots.

Ship Control Systems

Volume 1, Part 3, Chapter 3

Section 2

2.12 Rudder torque, Q_R

2.12.1 The rudder torque, Q_R , for the ahead condition may be determined from the following formula:

$$Q_R = F_R x_{PF} \text{ kNm}$$

where

F_R = rudder force, in kN

x_{PF} = horizontal distance from the centreline of the rudder pintles or axle, to the centre of pressure in the ahead condition, in metres, see Table 3.2.5.

2.12.2 The rudder torque, Q_R , for the astern condition may be determined from the following formula:

$$Q_R = F_R x_{PA} \text{ kNm}$$

where

x_{PA} = horizontal distance from the centreline of the rudder pintles or axle, to the centre of pressure in the astern condition, in metres, see Table 3.2.5

F_R = rudder force, in kN.

2.13 Rudder bending moment, M_R

2.13.1 For spade rudders, Type (b) in Fig. 3.2.1 the bending moment, M_R , may be determined from the following formula:

$$M_R = F_R \left(y_1 + \left(\frac{y_3 (2x_1 + x_u)}{3 (x_1 + x_u)} \right) \right) \text{ kNm}$$

where

F_R is as given in 2.11.1

y_1 , y_3 , x_1 and x_u are rudder dimensions, in metres, see Fig. 3.2.4.

Fig. 3.2.4 Spade rudder

2.13.2 For rudders supported by a rudder horn, Type (a) in Fig. 3.2.1 the bending moment, M_R , may be determined from the following formula:

$$M_R = 0,125 F_R (y_1 + y_2) \text{ kNm}$$

where

F_R is as given in 2.11.1

y_2 is a rudder dimension, in metres, see Fig. 3.2.5.

Fig. 3.2.5 Rudder supported by a rudder horn

2.14 Rudder stock diameter in way of the tiller, d_{su}

2.14.1 The torsional stress in the rudder stock, τ_t , in way of the tiller is not to exceed that determined from the following:

$$\tau_t = 68 K_o \text{ N/mm}^2$$

2.14.2 The rudder stock diameter in way of the tiller, d_{su} , is to be not less than that determined from the formula:

$$d_{su} = 42 \sqrt[3]{\frac{Q_R}{K_o}} \text{ mm}$$

where

Q_R = rudder torque (in the appropriate condition), in kNm, as given in 2.12

K_o = material factor, as defined in 1.4.3.

Ship Control Systems

Volume 1, Part 3, Chapter 3

Section 2

2.15 Rudder stock diameter d_s

2.15.1 For a rudder stock subjected to combined torque and bending, the equivalent stress in the rudder stock is not to exceed that determined from the following:

$$\sigma_e = 118K_o \text{ N/mm}^2$$

The equivalent stress is to be determined by the formula:

$$\sigma_e = \sqrt{\sigma_b^2 + 3\tau_t^2} \text{ N/mm}^2$$

where

Bending stress:

$$\sigma_b = 10200 \frac{M_R}{d_s^3} \times 10^3 \text{ N/mm}^2$$

Torsional stress:

$$\tau_t = 5100 \frac{Q_R}{d_s^3} \times 10^3 \text{ N/mm}^2$$

2.15.2 The basic rudder stock diameter, d_s , at and below the lowest bearing is not to be less than that determined from the following:

$$d_s = d_{su} \sqrt[6]{1 + \frac{4}{3} \left(\frac{M_R}{Q_R} \right)^2} \text{ mm}$$

where

d_{su} = diameter of the rudder stock in way of the tiller, in mm

M_R = rudder bending moment, kNm, see 2.13

Q_R = rudder torque (in the appropriate condition), in kNm, as given in 2.12.

2.16 Rudder stock (tubular)

2.16.1 Tubular rudder stock scantlings are to be not less than that necessary to provide the equivalent strength of a solid stock as required by 2.14.2 and 2.15.2 as appropriate, and can be calculated from the following formula:

$$d_e = \sqrt[3]{\frac{d_1^4 - d_2^4}{d_1}} \text{ mm}$$

where

d_e = the diameter of the equivalent solid rudder stock, in mm

d_1, d_2 = external and internal diameters, respectively of the tubular stock, in mm.

2.17 Single plate rudders

2.17.1 The scantlings of a single plate rudder are to be not less than required by Table 3.2.6.

2.17.2 Rudder arms are to be efficiently attached to the mainpiece.

2.18 Double plate rudders

2.18.1 The scantlings of a double plated rudder are to be not less than required by Table 3.2.7.

2.18.2 In way of rudder couplings and heel pintles the plating thickness is to be suitably increased.

Table 3.2.6 Single plate rudder construction

Item	Requirement
Blade thickness	$t_B = 0,0015Vs + 2,5 \text{ mm}$ with a minimum of 10 mm
Arms	Spacing $\leq 1000 \text{ mm}$ $Z_A = 0,0005V^2 x_a^2 s \text{ cm}^3$
Mainpiece	Diameter = $d_s \text{ mm}$ For spade rudders, the lower third may taper down to $0,75d_s \text{ mm}$
Symbols	
t_B = blade thickness, in mm s = vertical spacing of rudder arms/stiffeners, in mm V = speed, in knots, as defined in 2.11.1 x_a = horizontal distance from the aft edge of the rudder to the centre of the rudder stock, in metres Z_A = section modulus of arm, in cm^3 d_s = basic stock diameter, given by 2.15.2	

2.18.3 Adequate hand or access holes are to be arranged in the rudder plating in way of pintles as required and the rudder plating is to be reinforced locally in way of these openings. Continuity of the modulus of the rudder mainpiece is to be maintained in way of the openings.

2.18.4 Connection of rudder side plating to vertical and horizontal webs, where internal access for welding is not practicable, is to be by means of slot welds on to flat bars on the webs. The slots are to have a minimum length of 75 mm and in general, a minimum width of twice the side plating thickness. The ends of the slots are to be rounded. The space between the slots is not to exceed 150 mm and welding is to be based on a weld factor of 0,44.

2.19 Cast metal rudders

2.19.1 Where rudders are cast, the mechanical and chemical properties of the metal are to be submitted for approval. If the rudder stock is cast integral with the rudder blade, abrupt changes of section and sharp corners are to be avoided.

2.20 Lowest main bearing requirement

2.20.1 The design of the lowest bearing is to comply with the requirements of Table 3.2.8.

2.21 Bearings

2.21.1 Bearings are to be of approved materials and effectively secured to prevent rotational and axial movement.

2.21.2 Synthetic rudder stock bearing materials are to be of a type approved by LR.

Table 3.2.7 Double plated rudder construction

Item		Requirement
(1)	Side plating	$t = 0,0224 \text{ s } \beta \sqrt{\frac{P_R}{110k_O}} + 2,5 \text{ mm}$
(2)	Webs – vertical and horizontal	As (1) above
(3)	Top and bottom plates	As (1) above using s = maximum rudder width, in mm, at top or bottom, but not less than 900 mm.
(4)	Nose plates	$t_N \geq 1,25t$ from (1) above
(5)	Mainpiece – fabricated rectangular	Breadth and width $\geq d_s$ $t_M = (8,5 + 0,56\sqrt{d_s}) \text{ mm}$ Minimum fore and aft extent of side plating = $0,2x_B$ Stress due to bending $\leq 78,0 \text{ N/mm}^2$
(6)	Mainpiece – tubular	Inside diameter $\geq d_s$ t_M as for (5) above Side plating as for (1) above Bending stress as for (5) above
(7)	Testing	
	Pressure	2,45 m head and rudder should normally be tested while laid on its side
	Leak (air pressure)	0,02 N/mm ² and arrangements made to ensure that no pressure in excess of 0,03 N/mm ² can be applied
Symbols		
$\beta = A_a (1 - 0,25A_a)$ A_a = panel aspect ratio, but is not to be taken as greater than 2,0 t = thickness, in mm s = spacing, in mm, of the webs, arms or stiffeners, but is not to exceed 900 mm d_s = basic stock diameter, given by 2.15.2, in mm t_N = thickness, in mm, of nose plate t_M = thickness, in mm, of side plating and vertical webs forming mainpiece x_B = breadth of rudder, in metres, on centreline of stock P_R = rudder pressure $= 10T + \frac{F_R}{A_R} \text{ kN/m}^2$ T = is as detailed in Ch 1,5.2.9 F_R = rudder force, in kN, given by 2.11 A_R = area of rudder blade, in m ² , given in 2.11.1		

2.21.3 Where it is proposed to use stainless steel bearings for rudder stocks, the chemical composition is to be submitted for approval.

2.21.4 When stainless steel bearings are used, arrangements to ensure an adequate supply of sea-water to the bearing are to be provided.

2.21.5 When the rudder stock or liner is grade 316L austenitic stainless steel, it is recommended that gunmetal, lignum vitae or a synthetic bearing material be used in the bush. If a stainless steel is used in the bush, it is to be of a different grade and with an adequate hardness difference. The use of a ferritic/austenitic duplex structure stainless steel is recommended for the bush, but 17 per cent to 30 per cent chromium stainless steels are also suitable.

2.22 Liners

2.22.1 Where liners are fitted to rudder stocks or pintles, they are to be shrunk on or otherwise efficiently secured.

2.22.2 Where it is proposed to use stainless steel liners, the chemical composition is to be submitted for approval.

2.22.3 When stainless steel liners are used, arrangements to ensure an adequate supply of sea-water to the liner are to be provided.

2.23 Pintles

2.23.1 Rudder pintles and their bearings are to comply with the requirements of Table 3.2.9.

2.23.2 Where the lower pintle is housed above the rudder gudgeon, see Fig. 3.2.6, C_{PL} is to be measured to the top of the gudgeon.

Table 3.2.8 Lowest main bearing requirements

Item	Requirement	
Lowest main bearing	Depth Z_B , in mm $1,5d_s \geq Z_B \geq 1,0d_s$	Minimum thickness of wall, in mm lesser of $0,2d_s$ or 100
Bearing pressure (on the projected area of the lowest main bearing), where the projected area is to be taken as the length x diameter	Bearing material	Maximum pressure, in N/mm ² (see Note 4)
	Metal Synthetic	7,0 5,5
Clearance in lowest main bearing on the diameter (note should be taken of the manufacturer's recommended clearances, particularly where bush material requires pre-soaking)	Bearing material	Minimum clearance, in mm (see Note 3)
	Metal (see Note 2) Synthetic	$0,001d_s + 1,0$ $0,002d_s + 1,0$ but not less than 1,5
Symbols		
d_s = stock diameter, given by 2.15.2, in mm		
NOTES 1. Where web stiffening is fitted on the bearing, a reduction in wall thickness will be considered. 2. For bearings which are pressure lubricated the clearance must be restricted to enable the pressure to be maintained. 3. Value of proposed minimum clearance is to be indicated on plans submitted for approval. 4. Proposals for higher pressures or other materials will be specially considered on the basis of satisfactory test results.		

2.23.3 Special attention is to be paid to the fit of the pintle taper into its socket. To facilitate removal of the pintles, it is recommended that the taper is to be not less than half the maximum value given in Table 3.2.9.

2.23.4 The distance between the lowest rudder stock bearing and the upper pintle is to be as short as possible.

2.23.5 Where liners are fitted to pintles, they are to be shrunk on or otherwise efficiently secured. If liners are to be shrunk on, the shrinkage allowance is to be indicated on the plans. Where liners are formed by stainless steel weld deposit, the pintles are to be of weldable quality steel and details of the procedure are to be submitted.

2.23.6 Where an ***IWS** (In-water Survey) notation is to be assigned, see 2.40.

2.24 Bolted couplings

2.24.1 Rudder coupling design is to be in accordance with Table 3.2.10.

2.24.2 Where coupling bolts are required they are to be fitted bolts. Suitable arrangements are to be made to lock the nuts.

2.24.3 For rudders with horizontal coupling arrangements the rudder stock should be forged when the stock diameter exceeds 350 mm. Where the stock diameter does not exceed 350 mm the rudder stock may be either forged or fabricated. Where the upper flange is welded to the rudder stock, a full penetration weld is required and its integrity is to be confirmed by non-destructive examination. The flange material is to be from the same welding materials group as the stock. Such rudder stocks are to be subjected to a furnace post-weld heat treatment (PWHT) after completion of all welding operations. For carbon or carbon manganese steels, the PWHT temperature is not to be less than 600°C.

2.24.4 For a spade rudder the fillet radius between the rudder stock and the flange is to conform to the requirements of Fig. 3.2.8. Where space permits between the upper face of the flange and the lower rudder stock bearing, it is preferable to use a compound fillet design of the parabolic or Morgenbrod form having similar dimensions to those of Fig. 3.2.8. Alternative arrangements will be specially considered.

Ship Control Systems

Volume 1, Part 3, Chapter 3

Section 2

Table 3.2.9 Pintle requirements

Item	Requirement	
(1) Pintle diameter (measured outside liner if fitted)	$d_{PL} = \sqrt[3]{\left(\frac{235}{\sigma_o}\right)^m (31 + 4,17V\sqrt{A_{PL}})} \text{ mm}$ <p>For single pintle rudders</p> $A_{PL} = \frac{A_R C_{CP}}{C_{PL}} \text{ m}^2$	
(2) Maximum pintle taper	Method of assembly	Taper (on diameter)
	Manual assembly, key fitted (pintle ≤ 200 mm diameter)	1 in 6
	Manual assembly, key fitted (pintle ≥ 400 mm diameter)	1 in 9
	For keyed and other manually assembled pintles with diameters between 200 mm and 400 mm, the taper is to be obtained by interpolation.	
(3) Bearing length	Hydraulic assembly, dry fit	1 in 12
	Hydraulic assembly, oil injection	1 in 15
(4) Bearing pressure (on projected area)	$Z_{PB} \geq 1,2d_{PL} \text{ mm}$ May be less for very large pintles if bearing pressure is not greater than that given in (4), but Z_{PB} must be not less than $1,0d_{PL} \text{ mm}$	
(5) Gudgeon thickness in way of pintle (measured outside bush if fitted)	Bearing material	Pressure
	Metal	7,0 N/mm ²
	Synthetic	5,5 N/mm ²
	Using force acting on bearing: $P_{PL} = \frac{A_{PL} F_R}{A_R} \text{ kN}$ A_{PL} as for item (1) A_R and F_R are as defined in 2.11.1	
(6) Pintle clearance (note should be taken of the manufacturer's recommended clearances particularly where bush material requires pre-soaking). Value of proposed minimum clearance is to be indicated on plans submitted for approval.	Bearing material	Minimum clearance, mm
(7) Symbols	Metal	0,001 d_{PL} + 1,0
	Synthetic	0,002 d_{PL} + 1,0 but not less than 1,5
d_{PL} = pintle diameter, in mm V = as defined in 2.11.1 but not less than 10 knots A_{PL} = rudder area supported by the pintle, in m ² C_{CP} , C_{PL} = dimensions in metres, as indicated in Fig. 3.2.6 A_R = rudder area, in m ² σ_o = as defined in 1.2.1 Z_{PB} = pintle bearing length, in mm P_{PL} = force acting on bearing, in kN b_G = thickness of gudgeon material in way of pintle, in mm m = as defined in 1.4.3		
NOTE Proposals for higher pressures or other materials will be specially considered on the basis of satisfactory test results.		

2.24.5 The connecting bolts for coupling the rudder to the rudder stock are to be positioned with sufficient clearance to allow the fitting and removal of the bolts and nuts without contacting the palm radius, R , see Fig. 3.2.7. The surface forming the palm radius is to be free of hard and sharp corners and is to be machined smooth to the Surveyor's satisfaction. The surface in way of bolts and nuts is to be machined smooth to the Surveyor's satisfaction.

2.24.6 For spade rudders fitted with a fabricated rectangular mainpiece, the mainpiece is to be designed with its forward and aft transverse sections at equal distances forward and aft of the rudder stock transverse axis, see Fig. 3.2.7(b).

Table 3.2.10 Rudder couplings to stock (see continuation)

Arrangement	Parameter	Requirement	
		Horizontal coupling	Vertical coupling
(1) Bolted couplings (see Note 4)	n	≥ 6	≥ 8
	d_b	$\frac{0,65d_s}{\sqrt{n}}$	$\frac{0,81d_s}{\sqrt{n}}$
	m	$0,00071n d_s d_b^2$	$0,00043d_s^3$
	t_f	$\geq d_b$	d_b
	α_{\max} (see Note 2)	$(53,82 - 35,29K_o) - \frac{d_s^3}{F_R h 10^6} - \left(1,8 - 6,3 \frac{R}{d_s}\right) \frac{t_f - t_{fa}}{t_{fa}}$	—
	$\alpha_{as \text{ built}}$ (see Note 2)	$\leq \alpha_{\max}$	—
	w_f	$0,67d_b$	$0,67d_b$
(2) Conical couplings	θ_t	$\leq \frac{1}{K_1}$	
	l_t	$\geq 1,5d_s$	
	σ_{GM}	$\frac{P_R \theta_t d_{STM} + 4Q_R \sqrt{K_2 \left(\left(\frac{P_R d_{STM}}{2Q_R} \right)^2 + 1 \right) - \left(\frac{\theta_t}{2} \right)^2}}{5,66 (d_{STM})^2 l_t \left(K_2 - \left(\frac{\theta_t}{2} \right)^2 \right)}$	
	w	$\frac{9,6\sigma_{GM} d_{STM}}{\theta_t (1 - f_m^2)} \times 10^{-6}$	
	P_u	Approximately equal to	$2,83 \sigma_{GM} l_t d_{STM} \left(K_3 + \frac{\theta_t}{2} \right)$
	P_o	Approximately equal to	$2,83\sigma_{GM} l_t d_{STM} \left(K_3 - \frac{\theta_t}{2} \right)$
	σ_o	$\geq \frac{12,35 \times 10^4 w \theta_t \sqrt{3 + f^4}}{d_{ST}}$	

2.25 Conical couplings

2.25.1 Where a rudder stock is connected to a rudder by a keyless fitting, the rudder is to be a good fit on the rudder stock cone. During the fit-up, and before the push-up load is applied, an area of contact of at least 90 per cent of the theoretical area of contact is to be achieved and this is to be evenly distributed. The relationship of the rudder to stock at which this occurs is to be marked and the push-up then measured from that point. The upper edge of the upper mainpiece bore is to have a slight radius. After final fitting of the stock to the rudder, positive means are to be used for locking the securing nut to the stock.

2.25.2 Where a keyed tapered fitting of a rudder stock to a rudder is proposed, a securing nut of adequate proportions is to be provided. After final fitting of the stock to the rudder, positive means are to be used for locking this nut.

2.26 Rudder carrier arrangements

2.26.1 The weight of the rudder is to be supported at the heel pintle or by a carrier attached to the rudder head. The hull structure supporting the carrier bearing is to be adequately strengthened. The plating under all rudder-head bearings or rudder carriers is to be increased in thickness.

2.27 Anti-jump collars

2.27.1 Suitable arrangements are to be provided to prevent the rudder from lifting.

2.27.2 Jumping collars are not to be welded to the rudder stock.

Ship Control Systems

Volume 1, Part 3, Chapter 3

Section 2

Table 3.2.10 Rudder couplings to stock (continued)

Symbols																								
n = number of bolts in coupling d_b = diameter of coupling bolts, in mm d_s, d_{su} = rudder stock diameters as defined in 2.15 and 2.14 respectively m = first moment of area of bolts about centre of coupling, in cm^3 t_f = thickness of coupling flange, in mm w_f = width of flange material outside the bolt holes, in mm K_o = rudder stock material factor see 1.4.3 h = vertical distance between the centre of pressure and the centre point of the palm radius, R , in metres, see Fig. 3.2.7(a) R = palm radius between rudder stock and connected flange not smaller than $\frac{d_s}{10}$ in mm t_f = minimum thickness of coupling flange, in mm t_{fa} = as built flange thickness, in mm α_{max} = maximum allowable stress concentration factor $\alpha_{\text{as built}}$ = stress concentration factor for as built scantlings $= \frac{0,73}{\sqrt{\left(\frac{R}{d_s}\right)}}$ θ_t = taper of conical coupling, on the diameter, e.g.: $\theta_t = \frac{1}{15} = 0,067$ F_R = rudder force kN l_t = length of taper, in mm	σ_{GM} = required mean grip stress, in N/mm^2 w = corresponding push-up of rudder stock, in mm P_u, P_o = corresponding push-up, pull-off loads respectively, in N σ_o = minimum yield stress of stock and gudgeon material, in N/mm^2 . σ_o is not to be taken greater than 70 per cent of the ultimate tensile strength P_R = effective weight of rudder, in N d_{STM} = mean diameter of coupling taper, in mm d_{ST} = diameter of coupling taper at any position, in mm d_{GHM} = mean external diameter of gudgeon housing, in mm d_{GH} = external diameter of gudgeon housing at any position, in mm $f_m = \frac{d_{STM}}{d_{GHM}}$ $f = \frac{d_{ST}}{d_{GH}}$ Q_R = maximum turning moment applied to stock, and is to be taken as the greater of: (a) As determined from 2.12. (b) The torque generated by the steering gear at the maximum working pressure b_f = breadth of the flange, in mm																							
K_1, K_2, K_3 = constants depending on the type of assembly adopted as follows:																								
	<table><tr><td></td><td></td><td>K_1</td><td>K_2</td><td>K_3</td></tr><tr><td rowspan="2">Oil injection method</td><td>with key</td><td>15</td><td>0,0064</td><td>0,025</td></tr><tr><td>without key</td><td>15</td><td>0,0036</td><td>0,025</td></tr><tr><td rowspan="2">Dry fit method</td><td>with key</td><td>12</td><td>0,0128</td><td>0,170</td></tr><tr><td>without key</td><td>12</td><td>0,0072</td><td>0,170</td></tr></table>			K_1	K_2	K_3	Oil injection method	with key	15	0,0064	0,025	without key	15	0,0036	0,025	Dry fit method	with key	12	0,0128	0,170	without key	12	0,0072	0,170
		K_1	K_2	K_3																				
Oil injection method	with key	15	0,0064	0,025																				
	without key	15	0,0036	0,025																				
Dry fit method	with key	12	0,0128	0,170																				
	without key	12	0,0072	0,170																				
NOTES																								
1. Where materials vary for individual components, scantling calculations for such components are to be based on d_s for the relevant material.																								
2. For spade rudders with horizontal couplings, t_f is not to be less than $0,33 d_s$. The mating plate on the rudder is to have the same thickness as the flange on the stock d_s .																								
3. For a twin spade rudder arrangement with single screw where the rudders are within the slipstream of the propeller: (a) the thickness of the palm is not to be less than $0,35 d_s$. (b) where the stock is welded to the palm plate, the stock diameter, d_s is to be increased by 14%.																								
4. This requirement is applicable only for spade rudders with horizontal couplings, see Fig. 3.2.7.																								

2.28 Drain plugs

2.28.1 Where rudders are of plated construction, drain plugs are to be provided to ensure that all compartments can be adequately drained. These plugs are to be locked and details of their scantlings, arrangements and position clearly indicated on the rudder plan.

2.29 Corrosion protection

2.29.1 All metalwork is to be suitably protected against corrosion. This may be by coating or, where applicable, by a system of cathodic protection.

2.29.2 Metalwork is to be suitably cleaned before the application of any coating. Where appropriate, blast cleaning or other equally effective means is to be employed for this purpose.

2.30 Dissimilar materials

2.30.1 Where materials vary for individual components, they are to be compatible to avoid galvanic corrosion. Scantling calculations for the components are to be based on d_s for the relevant material, see 2.15.

2.31 Internal coatings

2.31.1 Internal surfaces of the rudder are to be efficiently coated or the rudder is to be filled with foam plastics. Where it is intended to fill the rudder with plastic foam, details of the foam are to be submitted for consideration.

2.32 Pressure testing

2.32.1 For testing of rudders, see Part 6.

2.33 Tiller arms, quadrants

2.33.1 Tillers and quadrants are to comply with the requirements of Vol 2, Pt 6, Ch 1.

2.33.2 The steering gear is to be mounted on a seat and adequately secured.

2.34 Connecting bars

2.34.1 Connecting bars are to comply with the requirements of Vol 2, Pt 6, Ch 1.

2.35 Keys and keyways

2.35.1 Where the tiller or quadrant is bolted, a key having an effective cross-sectional area in shear of not less than $0,25d_{su}^2$ mm² is to be fitted. The thickness of the key is to be not less than $d_{su}/6$ mm. Alternatively, the rudder stock may be machined to a square section in lieu of fitting a key. d_{su} is as defined in 2.14.

2.35.2 Keyways are to extend over the full depth of the tiller boss.

2.35.3 Keyways in the rudder stock are to have rounded ends and the corners at the base of the keyway are to be radiused.

Ship Control Systems

Volume 1, Part 3, Chapter 3

Sections 2 & 3

2.36 Stopping arrangements

2.36.1 Suitable rudder stops are to be provided to limit the rudder angle to the desired level port and starboard. These stops are to be of substantial construction and efficiently connected to the supporting structure.

2.37 Novel designs

2.37.1 Where rudders are of a novel design they may be specially considered on the basis of the Rules. Alternatively the calculations are to be submitted for consideration.

2.38 Rudder tube arrangements

2.38.1 The rudder tube construction is to be of steel.

2.38.2 The scantlings of rudder tubes will be individually considered.

2.38.3 The bottom shell in way of the rudder tubes is to be additionally reinforced by means of an insert plate to increase the bottom shell thickness by 50 per cent.

2.38.4 Where rudder tubes are to be retained by bolting they are to be provided with a substantial flange securely attached to the hull structure. Where bolts are used, the nuts are to be suitably locked.

2.38.5 Where rudder tubes are to be welded to hull insert plates full penetration welding is required.

2.38.6 Rudder tubes are to be supported by suitable brackets and deep floors to avoid hard spots on the shell and to ensure continuity of the main hull structure.

2.38.7 Rudder bearings are to be secured against rotation within the rudder tubes by suitable pinch bolting or keys. Details are to be submitted for approval.

2.39 Watertight gland

2.39.1 In rudder trunks which are open to the sea, a seal or stuffing box is to be fitted above the deepest load waterline to prevent water from entering the steering gear compartment and the lubricant from being washed away from the rudder carrier. If the top of the rudder trunk is below the deepest waterline two separate stuffing boxes are to be provided. Rudder trunk boundaries where exposed to the sea are to have a corrosion protection coating applied in accordance with the manufacturer's instructions.

2.39.2 Where the top of the rudder tube is significantly higher than the deepest load waterline a lesser arrangement of watertightness, such as 'O' rings may be accepted.

2.39.3 The watertight gland body may be formed by the top of the fabricated or cast rudder tube; the gland packing being retained against the top bearing or a check in the wall of the rudder tube and is compressed by a gland packet which may be of the flange type, screwed cap or other suitable arrangement.

2.39.4 Alternative arrangements utilising lip seals or 'O' rings either in isolation or in combination with one or other of the alternative seal arrangements will be the subject of special consideration.

2.40 In-water Survey requirements

2.40.1 Where in-water surveys are required, notation is to be assigned, (see Pt 1, Ch 2,4.5.5), means are to be provided for ascertaining the rudder pintle and bush clearances and for verifying the security of the pintles in their sockets with the ship afloat.

Section 3 Stabiliser arrangements

3.1 General

3.1.1 This Section details the requirements for fin stabilisers, stabiliser tanks and bilge keel and fins.

3.1.2 The effectiveness of the fin stabilisers are out with the scope of classification; however their scantlings, arrangements, foundations, supporting structure and watertight integrity are to be examined.

3.1.3 Engineering systems are to comply with the appropriate requirements indicated in Volume 2, as applicable.

3.1.4 The general structure of the fin stabiliser is to comply with the Rule requirements for rudders.

3.1.5 Fin stabilisers are to be contained between watertight bulkheads.

3.1.6 For non-retractable type stabilisers, the watertight bulkheads forming the forward and aft extent of the compartment are to be arranged not less than one third of the root chord length, C , from the fore and aft most extents of the stabiliser, see Fig. 3.3.1. This requirement exists in order to ensure limited flooding in the event of hull damage in way of the fin. Alternate arrangements which are considered to be equivalent to the Rule requirements will be accepted.

3.1.7 For retractable type stabilisers, the watertight bulkheads forming the forward and aft extent of the compartment are to be arranged not less than the total length of the stabiliser (measured from the extreme end of the shaft to the blade tip) from the centreline of the stabiliser shaft.

3.1.8 For non-retractable type stabilisers, a separate watertight box surrounding the shell entry point may be required if the stabiliser is located adjacent to a critical compartment. No stabiliser box is needed if the compartment which it is in has adequate pumping arrangements and the ship has at least a one compartment flooded damage capability.

3.1.9 Where a watertight box surrounding the shell entry point is required, it is to extend longitudinally not less than the minimum bulkhead positions defined in 3.1.6 and vertically to ensure complete enclosure of the machinery and allow adequate inspection, see Fig. 3.3.1.

3.1.10 For both retractable and non-retractable type stabilisers the compartment in which the stabilisers are fitted is to contain a water ingress detector and alarm.

3.1.11 Fin stabiliser systems are, in general, not to extend beyond the extreme waterline breadth, B_{WL} , of the hull or below the horizontal line of keel. However, for retractable fins, alternative arrangements may be specially considered. Where the stabiliser fin extends beyond the extreme moulded beam of the hull in the active mode, the side shell is to be permanently marked indicating the fore and aft extent of the stabiliser, when deployed. It is recommended that an appropriate symbol be placed on the hull side between the marks.

3.1.12 The shell plating in way of retractable stabilisers is to comply with the requirements of 3.2. However, the longitudinal extent of the insert is to be such that it extends beyond around the hull opening in the fore/aft direction by not less than 25 per cent of the root chord length of the foil. In all other directions the extent of the insert shall be 1,25 times the root chord length of the foil over all operational lengths.

3.1.13 The scantlings of internal watertight bulkheads and stiffening for fixed installations are to be specified by the designer/builder and/or fin unit manufacturer, but in no case are to be less than the scantlings for double bottoms as defined in Pt 6, Ch 3. Suitable access is to be provided to allow for maintenance and inspection purposes.

3.1.14 The scantlings and sealing arrangements for the pedestal and bearings will be specially considered, subject to the designer/builder submitting the following:

- Detailed structural calculations for the proposed foundation and adjacent supporting structure.
- A detailed finite element analysis, if carried out.
- Calculations demonstrating that the effect of damage to the stabiliser arrangement arising from the high speed impact, grounding, fouling, etc. will not compromise the structural and watertight integrity of the ship.
- Maximum torque, bending moments and bearing loads expected for the proposed design.
- The stabiliser fin stock material, together with its ultimate tensile shear strength values (N/mm^2).

3.1.15 Fin bearing materials are to be of an approved type.

3.1.16 Where retractable stabilisers are fitted, position indicators are to be provided on the bridge and at auxiliary steering positions.

3.1.17 Where the fin stabiliser is of a novel design, high aspect ratio or the speed of the ship exceeds 45 knots, and the anticipated loads are likely to be significant, the scantlings of the fin and fin stock are to be determined by direct calculation methods incorporating model test results and structural analysis, where considered necessary by LR.

3.2 Fin stabilisers

3.2.1 The stabiliser machinery and surrounding structure is to be adequately supported and stiffened. Where cyclic bending stresses are induced in the structure which are likely to reduce the fatigue life the maximum stress is not to exceed $39,0 N/mm^2$ in mild steel. Where other materials are used for the supporting structure the limiting stress values will be specially considered.

3.2.2 The fin box into which the stabilisers are fitted is to have a perimeter plating with thickness not less than the surrounding Rule shell plating plus 2 mm, and is to be stiffened to the same standard as the adjacent hull structure. Ships constructed from materials other than steel will be specially considered.

3.2.3 Insert plates are to be fitted in way of stabilisers. The thickness of the insert is to be at least 50 per cent greater than the bottom shell thickness in way and is to extend over an area 1,25 times the stabiliser root chord length, covering all operational angles. In addition, for retractable stabilisers, the insert is to extend beyond the shell opening for a distance of not less than 25 per cent of the length of the root chord.

3.2.4 The thickness of plating in way of retractable foil recesses is to be not less than the bottom shell thickness plus 2 mm. Internal stiffening is to comply with the requirements of Ch 3,4, as applicable.

3.3 Centre of pressure

3.3.1 The position of the centre of pressure for use in the determination of the fin torque is to be as indicated in Table 3.3.1.

3.4 Fin force, F_F

3.4.1 The fin force, F_F , in kN, for use in the determination of the fin scantlings is to be submitted. For the astern condition the maximum astern speed, V_A , is to be used. In no case is the astern speed to be taken less than that determined from the following: $V_A \geq 0,5V$ knots.

3.5 Fin torque, Q_F

3.5.1 The fin torque, Q_F , for the ahead condition may be determined from the following formula:

$$Q_F = F_F x_{PF} \text{ kNm}$$

where

x_{PF} = horizontal distance from the centreline of the fin stock, to the centre of pressure in the ahead condition, in metres, see Table 3.3.1

F_F = fin force as defined in 3.4.1.

3.5.2 The fin torque, Q_F , for the astern condition may be determined from the following formula:

$$Q_F = F_F x_{PA} \text{ kNm}$$

where

x_{PA} = horizontal distance from the centreline of the fin stock, to the centre of pressure in the astern condition, in metres, see Table 3.3.1

F_F = fin force as defined in 3.4.1.

3.6 Fin bending moment, M_F

3.6.1 For conventional fins the bending moment, M_F , may be determined from the following formula:

$$M_F = F_F \left(y_1 + \left(\frac{y_2 (2x_1 + x_u)}{3 (x_1 + x_u)} \right) \right) \text{ kNm}$$

where

F_F is as given in 3,4

y_1, y_2, x_1 and x_u are fin dimensions, in metres see Fig. 3.3.2.

Table 3.3.1 Position of centre of pressure

Design criteria	Value of x_{PF} and x_{PA}
Rectangular fins: (a) Ahead condition	$x_{PF} = (0,33x_B - x_L)$, but not less than $0,12x_B$
(b) Astern condition	$x_{PA} = (x_A - 0,25x_B)$, but not less than $0,12x_B$
Non-rectangular fins: (a) Ahead condition	x_{PF} as calculated from geometric form
(b) Astern condition	x_{PA} (see Note) but not less than: $\frac{0,12A_F}{y_F}$
Symbols	
x_{PF} = horizontal distance from the centreline of the fin stock, to the centre of pressure in the ahead condition, in metres x_{PA} = horizontal distance from the centreline of the fin stock, to the centre of pressure in the astern condition, in metres x_B = breadth of fin, in metres y_F = depth of fin at centreline of stock, in metres A_F = fin area, in m ² x_L and x_A = horizontal distances from leading and after edges, respectively, of the fin to the centreline of the fin stock, in metres x_S = horizontal length of any rectangular strip of fin geometric form, in metres	
NOTE For rectangular strips the centre of pressure is to be assumed to be located as follows: (a) $0,33x_S$ abaft leading edge of strip for ahead condition. (b) $0,25x_S$ from aft edge of strip for astern condition.	

3.7 Fin stock diameter in way of tiller, d_{Fu}

3.7.1 The fin stock diameter in way of the tiller, d_{Fu} , is to be not less than that determined from the formula:

$$d_{Fu} = 42 \sqrt[3]{\frac{Q_F}{K_o}} \text{ mm}$$

where

Q_F = fin torque (in the appropriate condition), in kNm, as given in 3,5

K_o = material factor, as defined in 1.4.3.

Fig. 3.3.2 Fin stabiliser

3.8 Fin stock diameter, d_F

3.8.1 For a fin stock subjected to combined torque and bending, the equivalent stress in the fin stock is not to exceed that determined from the following:

$$\sigma_e \leq 118K_o \text{ N/mm}^2$$

where

K_o = material factor, as defined in 1.4.3.

The equivalent stress is to be determined by the formula:

$$\sigma_e = \sqrt{\sigma_b^2 + 3\tau_t^2} \text{ N/mm}^2$$

Bending stress: $\sigma_b = 10200 \frac{M_F}{d_F^3} \times 10^3 \text{ N/mm}^2$

Torsional stress: $\tau_t = 5100 \frac{Q_F}{d_F^3} \times 10^3 \text{ N/mm}^2$

3.8.2 The basic fin stock diameter, d_F , at and below the lowest bearing is not to be less than that determined from the following:

$$d_F = d_{Fu} \sqrt[6]{1 + \frac{4}{3} \left(\frac{M_F}{Q_F} \right)^2} \text{ mm}$$

where

d_{Fu} = diameter of the fin stock in way of the tiller, in mm

M_F = fin bending moment, kNm, see 3.6

Q_F = fin torque (in the appropriate condition), in kNm, as given in 3.5.

3.9 Fin plating

3.9.1 The thickness of the fin side plating is not to be less than that determined from the following:

$$t = 0,0224s \beta \sqrt{\frac{P_F}{110K_o}} + 2,5 \text{ mm}$$

where

s = stiffener spacing, in mm

β = panel aspect ratio correction factor

$$= A_R (1 - 0,25A_R) \text{ for } A_R \leq 2$$

$$= 1 \text{ for } A_R > 2$$

A_R = panel aspect ratio

= panel length/panel breadth

P_F = fin pressure, in kN/m²

$$= 10T + \frac{F_F}{A_F} \text{ kN/mm}^2$$

T = maximum draught, in metres

F_F = fin force, in kN, see 3.4

A_F = fin area, in m²

K_o = material factor, as defined in 1.4.3.

3.9.2 The thickness of the nose plates is not to be less than 1,25 times the thickness of the fin side plating. The thickness of web plates is not to be less than 70 per cent the thickness of the fin side plating, or 6 mm whichever is the greater.

3.9.3 Alternative materials and methods for fin stabilisers will be specially considered.

3.10 Stabiliser tanks

3.10.1 The general structure of the tank is to comply with the Rule requirements for deep tanks. Sloshing forces in the tank structure are to be taken into account. Where such forces are likely to be significant, the scantlings will be required to be verified by additional calculations.

3.11 Bilge keels and fins

3.11.1 It is recommended that bilge keels are not fitted forward of $0,7L_R$ on ships intended to navigate in ice conditions.

3.11.2 Bilge keels are to be gradually tapered at the ends and arranged to finish in way of a suitable internal stiffening member. The taper is to have a length to depth ratio of at least three to one.

3.11.3 A plan of the bilge keels is to be submitted for approval of material grades, welded connections and detail design.

3.11.4 The scantlings and attachment to the hull plating for steel ships is to be in accordance with Pt 6, Ch 6,5.11.

3.12 Novel features

3.12.1 Where the Rules do not specifically define the requirements for novel features then the scantlings and arrangements are to be determined by direct calculations. Such calculations are to be carried out on the basis of the Rules, recognised standards and good practice, and are to be submitted for consideration.

Section 4 Rudder horns and appendages

4.1 General

4.1.1 Rudder horns and boss end brackets may be constructed of cast or forged steel or fabricated from steel plate. Where shaft brackets are fitted these may be either fabricated, cast or forged from steel.

4.1.2 In castings, sudden changes of section or possible constrictions to the flow of metal during casting are to be avoided. All fillets are to have adequate radii, which, in general, are to be not less than 50 to 75 mm, depending on the size of the casting.

4.1.3 Castings and forgings are to comply with the requirements of Chapters 4 and 5 of the Rules for Materials.

4.1.4 Rudder horns, shaft brackets, etc., are to be effectively integrated into the ship structure, and their design is to be such as to facilitate this.

4.2 Propeller boss

4.2.1 The thickness of the propeller boss is to be not less than:

$$0,1d_{TS} + 56 \text{ but need not exceed } 0,3d_{TS}$$

where

d_{TS} = diameter of tailshaft in mm, see Fig. 3.4.1.

Fig 3.4.1 Propeller boss

4.3 Rudder horns

4.3.1 The requirements for the scantlings and arrangements of rudder horns will be subject to special consideration and may require to be determined by direct calculations.

4.4 Shaft bossing

4.4.1 Where the propeller shafting is enclosed in bossings extending back to the bearings supporting the propellers, the aft end of the bossings and the bearings are to be supported by substantially constructed boss end castings or fabrications. These are to be designed to transmit the loading from the shafting efficiently into the ship's internal structure.

4.4.2 For shaft bossings attached to shaft brackets, the length of the boss is to be adequate to accommodate the aftermost bearing and to allow for proper connection of the shaft brackets.

4.4.3 Cast steel supports are to be suitably radiused where they enter the main hull to line up with the boss plating radius. Where the hull sections are narrow, the two arms are generally to be connected to each other within the ship. The arms are to be strengthened at intervals by webs.

4.4.4 Fabricated supports are to be carefully designed to avoid or reduce the effect of hard spots. Continuity of the arms into the ship is to be maintained, and they are to be attached to substantial floor plates or other structure. The connection of the arms to the bearing boss is to be by full penetration welding.

4.4.5 The scantlings of supports will be specially considered. In the case of certain high powered ships, direct calculations may be required.

4.4.6 The boss plating is generally to be radiused into the shell plating and supported at the aft end by diaphragms at every frame. These diaphragms are to be suitably stiffened and connected to floors or a suitable arrangement of main and deep web frames. At the forward end, the main frames may be shaped to fit the bossing, but deep webs are generally to be fitted not more than four frame spaces apart.

4.5 Shaft brackets

4.5.1 The scantlings of the arms of shaft brackets, based on a breadth to thickness ratio of about five, are to be determined from 4.6.1 or 4.7.2 as appropriate.

4.5.2 Where the propeller shafting is exposed to the sea for some distance clear of the main hull, it is generally to be supported adjacent to the propeller by independent brackets having two arms. In very small ships the use of single arm brackets will be considered.

4.5.3 Fabricated brackets are to be designed to avoid or reduce the effect of hard spots and ensure a satisfactory connection to the hull structure. The connection of the arms to the bearing boss is to be by full penetration welding.

4.5.4 Bracket arms are in general to be carried through the shell plating, they are to be attached to floors or girders of increased thickness. The shell plating is to be increased in thickness and connected to the arms by full penetration welding.

4.5.5 In the case of certain high powered ships direct calculations may be required.

4.5.6 For shaft brackets having hollow section arms, the cross-sectional areas at the root and the boss should be not less than that required for a solid arm which satisfies the Rule section modulus having the proportions stated in 4.5.1.

4.5.7 The length of the shaft bracket boss, l_b , is to be sufficient to support the length of the required bearing. In general l_b is not to be less than $4d_t$, where d_t is the Rule diameter of the screwshaft, in mm, see Vol 2, Pt 3, Ch 2,4.4. Proposals for a reduction in the required shaft bracket boss length will be considered in conjunction with details of the bearing material, allowable bearing operating pressure and installation arrangements, see Vol 2, Pt 3, Ch 2,4.16.2. However in no case is l_b to be less than the greater of:

- (a) $2d_t$;
- (b) that recommended by the bearing manufacturer;
- (c) as required by 4.4.2.

4.5.8 Where the shaft and the shaft bracket boss are of the same material, the thickness of the shaft bracket boss is not to be less than $d_t/4$. Where the shaft and the shaft bracket boss are of dissimilar materials, the thickness of the boss, t_b , is to be not less than:

$$t_b = 0,75d_t \left(\sqrt[3]{f_1} - 0,667 \right) \text{ mm}$$

NOTE

In no case is t_b to be taken as less than 12 mm.

where

d_t = Rule diameter of the screwshaft, in the appropriate screwshaft material, in mm

f_1 = σ_S/σ_B but not less than 0,825

σ_S = ultimate tensile strength of the shaft material, in N/mm²

σ_B = ultimate tensile strength of the boss material, in N/mm².

4.5.9 The design of the shaft brackets with regard to disturbance of the hydrodynamic flow into the propeller and rudders is out with the scope of classification.

4.6 Single arm shaft brackets ('P' – brackets)

4.6.1 Single arm shaft brackets are to have a section modulus, Z_{xx} , at the palm of not less than that determined from the formula:

$$Z_{xx} = \frac{a_s d_{ms}^2 f}{45000} \text{ cm}^3$$

where

a_s = the length of the arm to be measured from the centre of the section at the palm to the centreline of the shaft boss, in mm, see Fig. 3.4.2

d_{ms} = the Rule diameter for an unprotected screwshaft, in mm, as given in Vol 2, Pt 3, Ch 2 using

$A = 1,0$

$f = 400/\sigma_U$

σ_U = ultimate tensile strength of arm material, in N/mm²

The cross-sectional area of the bracket at the boss is to be not less than 60 per cent of the area of the bracket at the palm.

4.6.2 For single arm shaft brackets a vibration analysis may be required if deemed necessary by LR.

Fig. 3.4.2
Single arm shaft bracket (bolted attachment)

4.7 Double arm shaft brackets ('A' – brackets)

4.7.1 The angle between the arms for double arm shaft brackets is to be generally not less than 50°. Proposals for the angle between the arms to be less than 50° will be specially considered with supporting calculations to be submitted by the designers.

4.7.2 The arms of double arm shaft brackets are to have a section modulus, Z_{xx} , of not less than that determined from the formula:

$$Z_{xx} = 0,45n^3 \text{ cm}^3$$

where

n = the minimum thickness, in cm, of a hydrofoil section obtained from:

$$n = d_{ms} \sqrt[3]{\left(\frac{f}{2000}\right) \left(1 + \sqrt{1 + \left(\frac{0,0112}{f}\right) \left(\frac{a_d}{d_{ms}}\right)^2}\right)} \text{ cm}$$

a_d = the length of the longer strut, in mm, see Fig. 3.4.3
 d_{ms} and f are as given in 4.6.1.

4.8 Intermediate shaft brackets

4.8.1 The length and thickness of the shaft bracket boss are to be as required by 4.5.7 or 4.5.8 as appropriate. The scantlings of the arms will be specially considered on the basis of the Rules.

4.9 Attachment of shaft brackets by welding

4.9.1 Fabricated supports are to be carefully designed to avoid or reduce the effect of hard spots. Continuity of the arms into the ship is to be maintained, and they are to be attached to substantial floor plates or other structure. The connection of the arms to the bearing boss is to be by full penetration welding.

4.10 Attachment of shaft brackets by bolting

4.10.1 The bottom shell thickness in way of the double arm propeller bracket palms is to be increased by 50 per cent. The bottom shell thickness in way of single arm propeller brackets palms is to be doubled in thickness. The insert plates are to be additionally supported by substantial floor plates or other structure.

4.10.2 Where shaft brackets are attached by bolts, they are to be provided with substantial palms securely attached to the hull structure which is to be adequately stiffened in way. Where bolts are used, the nuts are to be suitably locked.

4.10.3 The bracket palms may be bolted directly onto the shell using a suitable bedding compound. The palms may be bolted onto suitable shims or chocking compound, of an approved type, to facilitate alignment.

4.10.4 Where brackets are bolted onto resin chocks, plans indicating the following information are to be submitted for approval:

- The thrust and torque loads, where applicable, that will be applied to the chocked item.
- The torque load to be applied to the bracket mounting bolts.
- The material of the bracket mounting bolts.
- The number, thread size, shank diameter and length of the mounting bolts.

4.10.5 The minimum thickness of a resin chock is to be 12 mm.

4.10.6 The bracket palms are to have well radiused corners, and the faying surface to be dressed smooth. The palm thickness in way of the bolts is to be not less than the propeller bracket boss thickness from 4.5.7 or 4.5.8 as appropriate.

4.10.7 The diameter of the propeller bracket mounting bolts is to be not less than:

$$d_b = \sqrt{\frac{Z_{xx}}{8,75 \pi n h \times 10^{-5}}} \text{ mm}$$

subject to $d_{bmin} \geq t_b$ mm

where

Z_{xx} = the section modulus of the bracket arm determined from 4.6.1 or 4.7.2, cm^3 , as appropriate

n = the number of bolts in each row

h = the distance between rows of bolts, mm

d_b = the bolt diameter in the same material as the propeller bracket, mm

t_b = the propeller bracket boss thickness, mm.

4.10.8 Where the shaft bracket and the shaft bracket mounting bolts are of dissimilar materials (which are galvanically compatible), the diameter of the propeller bracket mounting bolts, as determined from 4.10.7, is to be modified in proportion to the square root of the yield strengths of the particular materials. The corrected bolt diameter of the dissimilar material is to be not less than the propeller bracket boss thickness.

4.10.9 The propeller bracket palms are to have fitted bolts, and suitable arrangements provided to lock the nuts.

4.10.10 A washer plate is to be provided, generally of equal dimensions to the bracket palm with thickness $t_b/6$ mm, subject to a minimum of 3 mm.

4.11 Alignment of shaft brackets

4.11.1 Particular care is to be paid to the alignment of shaft brackets to minimise vibration and cyclic loadings being transmitted from the propulsion shafting and propellers into the hull structure.

4.11.2 Alignment of bolted shaft brackets may be by means of suitable metallic shims or chocking resin of an approved type, see 4.10.2 and 4.10.3.

4.11.3 The alignment of shaft brackets connected by welding or bonding may be facilitated by boring of the bracket boss after attachment of the shaft bracket and sterntube.

4.12 Sterntubes

4.12.1 The sterntube scantlings are to be individually considered.

4.12.2 The bottom shell, in way of the sterntube, is to be additionally reinforced by means of an insert plate to increase the bottom shell thickness by 50 per cent.

4.12.3 The sterntube should in general be connected to the shell by welding. Bolted arrangements will be specially considered.

4.12.4 Where sterntubes are to be retained by bolting they are to be provided with a substantial flange securely attached to the hull structure. Where bolts are used, the nuts are to be suitably locked.

4.12.5 Where sterntubes are to be welded to hull insert plates full penetration welding is required.

4.12.6 Where sterntubes are to be installed using a resin system, of an approved type, the requirements of Pt 6, Ch 6 are to be complied with.

4.12.7 The region where the shafting enters the ship, and the bearing in way, is to be adequately supported by floors or deep webs.

4.12.8 The shaft bearings are to be secured against rotation within the sterntube.

4.12.9 A suitable gland arrangement is to be provided at the inboard end of sterntubes.

4.13 Skegs

4.13.1 Skegs are to be efficiently integrated into the adjacent hull structure and their design is to facilitate this.

4.13.2 The scantlings of skegs are to be sufficient to withstand any docking forces imposed upon them.

4.14 Propeller hull clearances

4.14.1 Recommended minimum clearances between the propeller and the sternframe, rudder or hull are given in Table 3.4.1. These are the minimum distances considered desirable in order to expect reasonable levels of propeller excited vibration. Attention is drawn to the importance of the local hull form characteristics, shaft power, water flow characteristics into the propeller disc and cavitation when considering the recommended clearances.

Table 3.4.1 Recommended minimum propeller hull clearances

Number of blades	Hull clearances for twin screw, in metres, see Fig. 3.4.4	
	<i>e</i>	<i>f</i>
3	$1,20K d_P$	$1,20K d_P$
4	$1,00K d_P$	$1,20K d_P$
5	$0,85K d_P$	$0,85K d_P$
6	$0,75K d_P$	$0,75K d_P$
Minimum value	3 and 4 blades, $0,20d_P$ 5 and 6 blades, $0,16d_P$	$0,15d$
Symbols		
L_R and C_B are as defined in Ch 1.5.2		
$K = \left(0,1 + \frac{L_R}{3050}\right) \left(\frac{3,48C_B P_s}{L_R^2} + 0,3\right)$		
t_R = thickness of rudder, in metres measured at $0,7R_P$ above the shaft centreline		
P_s = designed power on one shaft, in kW		
R_P = propeller radius, in metres		
d_P = propeller diameter, in metres		
NOTE The above recommended minimum clearances also apply to semi-spade type rudders.		

Section 5 Fixed and steering nozzles, bow and stern thrust units, ducted propellers

5.1 General

5.1.1 The requirements for scantlings for fixed and steering nozzles are given, for guidance only, in 5.2 to 5.4 and Table 3.5.1.

5.1.2 The requirements, in general, apply to nozzles with a numeral not greater than 200, see Table 3.5.1. Nozzles exceeding this value will be specially considered.

5.2 Nozzle structure

5.2.1 For basic scantlings of the structure, see Table 3.5.1, in association with Fig. 3.5.1.

5.2.2 The shroud plating in way of the propeller tips is to be carried well forward and aft of this position, due allowance being made on steering nozzles for the rotation of the nozzle in relation to the propeller.

5.2.3 Fore and aft webs are to be fitted between the inner and outer skins of the nozzle. Both sides of the headbox and pintle support structure are to be connected to fore and aft webs of increased thickness. For thicknesses, see Table 3.5.1.

5.2.4 The transverse strength of the nozzle is to be maintained by the fitting of ring webs. Two ring webs are to be fitted in nozzles not exceeding 2,5 m diameter. Nozzles between 2,5 and 3,0 m in diameter are generally to have two full ring webs and a half-depth web supporting the flare plating. The number of ring webs is to be increased as necessary on nozzles exceeding 3,0 m in diameter. Where ring webs are increased in thickness in way of the headbox

Fig. 3.5.1 Fixed and steering nozzles

and pintle support structure in accordance with Table 3.5.1, the increased thickness is to be maintained to the adjacent fore and aft web.

5.2.5 Local stiffening is to be fitted in way of the top and bottom supports which are to be integrated with the webs and ring webs. Continuity of bending strength is to be maintained in these regions.

Table 3.5.1 Nozzle construction requirements

Item	Requirement
(1) Nozzle Numeral	$N_N = 0,01P d_P$
(2) Shroud plating in way of propeller blade tips	For $N_N \leq 63$ $t_s = (11 + 0,1N_N)$ mm For $N_N > 63$ $t_s = (14 + 0,052N_N)$ mm
(3) Shroud plating clear of blade tips, flare and cone plating, wall thickness of leading and trailing edge members	$t_p = (t_s - 7)$ mm but not less than 8 mm
(4) Webs and ring webs	As item (3) except in way of headbox and pintle support where $t_W = (t_s + 4)$ mm
(5) Nozzle stock	Combined stresses in stock at lower bearing $\leq 92,7$ N/mm ² Torsional stress in upper stock $\leq 62,0$ N/mm ²
(6) Solepiece and strut	Bending stresses not to exceed 70,0 N/mm ²
Symbols	
N_N = a numeral dependent on the nozzle requirements P = power transmitted to the propellers, in kW d_P = diameter of the propeller, in metres t_s = thickness of shroud plating in way of propeller tips, in mm t_p = thickness of plating, in mm t_W = thickness of webs and ring webs in way of headbox and pintle support, in mm	
NOTE Thicknesses given are for carbon steel. Reductions in thickness will be considered for certain stainless steels.	

Ship Control Systems

Volume 1, Part 3, Chapter 3

Sections 5 & 6

5.2.6 Fin plating thickness is to be not less than the cone plating, and the fin is to be adequately reinforced. Solid fins are to be not less than 25 mm thick.

5.2.7 Care is to be taken in the manufacture of the nozzle to ensure its internal preservation and watertightness. The preservation and testing are to be as required for rudders, see Part 6.

5.3 Nozzle stock and solepiece

5.3.1 Stresses, derived using the maximum side load on the nozzle and fin acting at the assumed centre of pressure, are not to exceed the values given in Table 3.5.1, in both the ahead and astern conditions.

5.4 Ancillary items

5.4.1 The diameter of pintles and the diameter and first moment of area about the stock axis of coupling bolts are to be derived from 2.23 and 2.24 respectively.

5.4.2 Suitable arrangements are to be provided to prevent the steering nozzle from lifting.

5.5 Steering gear and allied systems

5.5.1 For the requirements of steering gear, see Vol 2, Pt 6, Ch 1.

5.6 Thruster unit wall thickness

5.6.1 The wall thickness of the unit is, in general, to be in accordance with the manufacturer's practice, but is to be not less than the thickness of the adjacent shell plating plus 10 per cent or 2 mm whichever is the greater, subject to a minimum of 7 mm.

5.7 Thruster unit installation details

5.7.1 The tunnel tube is to be fitted either between a pair of deep floors or bulkheads extending to above the design waterline or in a separate watertight compartment.

5.7.2 The shell plating thickness is to be locally increased by 50 per cent in way of tunnel thruster connections.

5.7.3 For welded tube connections the welding is to be by full penetration welding.

5.7.4 The tunnel tube is to be framed to the same standard as the surrounding shell plating.

5.7.5 The unit is to be adequately supported and stiffened.

5.8 Propeller ducting

5.8.1 Where propellers are fitted within ducts/tunnels the plating thickness in way of the blades is to be increased by 50 per cent.

5.8.2 The tunnel wall in way of the propeller blades is to be additionally stiffened.

5.9 Surface drive mountings

5.9.1 Transoms through which surface drive systems pass and which are required to carry thrust, significant weight, torque, moment, etc., are to be adequately reinforced.

5.9.2 The thickness of transom plating in way is to be increased by 50 per cent or as advised by the drive manufacturer, whichever is the greater.

5.9.3 Steering rams are to be mounted on suitably reinforced areas of plating supported by additional internal stiffening, details of which are to be submitted for consideration.

5.10 Novel features

5.10.1 Where the Rules do not specifically define the requirements for novel features then the scantlings and arrangements are to be determined by direct calculations. Such calculations are to be carried out on the basis of the Rules, recognised standards and good practice, and are to be submitted for consideration.

Section 6 Waterjet propulsion systems

6.1 Construction

6.1.1 The requirements for the construction and installation of water jet units apply irrespective of rated power.

6.1.2 Water jet ducts may be fabricated as an integral part of the hull structure, or as a bolted-in unit. In either case, detailed plans indicating dimensions, scantlings and materials of construction of the following are to be submitted in triplicate.

- (a) Arrangement of the system including intended method of attachment to the hull and building-in, geometry of tunnel, shell opening, method of stiffening, reinforcement, etc.
- (b) Shaft sealing arrangements.
- (c) Details of any shafting support or guide vanes used in the water jet system.
- (d) Details and arrangements of inspection ports, their closing appliances and sealing arrangement, etc.
- (e) Details and arrangements of protection gratings and their attachments.

6.1.3 When submitting the plans requested in 6.1.2, details of the designers' loadings and their positions of application in the hull are to be submitted. These are to include maximum applied thrust, moments and tunnel pressures for which approval is sought.

6.1.4 All materials used in construction are to be manufactured and tested in accordance with the Rules for Materials.

6.1.5 Steels are to be of suitable grades in accordance with the requirements of Pt 6, Ch 6.

6.1.6 Irrespective of the material used, the strength and supporting structure of all tunnels are to be examined by direct calculation procedures which are to be submitted. In no case are the scantlings to be taken as less than the Rule requirements for the surrounding structure. The strength of the hull structure in way of tunnels is to be maintained. The structure is to be adequately reinforced and compensated as necessary. All openings are to be suitably reinforced and have radiused corners.

6.1.7 Consideration is to be given to providing the inlet to the tunnel with a suitable guard to prevent the ingress of large objects into the rotodynamic machinery. The dimensions of the guard are to strike a balance between undue efficiency loss due to flow restriction and viscous losses, the size of object allowed to pass and susceptibility to clog with weed and other flow restricting matter.

6.1.8 The inlet profile of the tunnel is to be so designed as to provide a smooth uptake of water over the range of craft operating trims and avoid significant separation of the flow into the rotating machinery.

6.1.9 Single or multiple water jet unit installations having a total rated power in excess of 500 kW are to be contained within their own watertight compartment. Other arrangements for maintaining watertight integrity may be specially considered depending on the size and installation layout.

6.1.10 For details of machinery requirements, see Vol 2, Pt 4, Ch 2.

6.2 Water jet propulsion systems – Installation

6.2.1 Standard units built for 'off the shelf' supply and which include the duct are to be installed strictly in accordance with the manufacturer's instructions, see also 6.1.4.

6.2.2 Integral water jet ducts are to be constructed in accordance with the manufacturer's requirements and the relevant plans submitted as required by 6.1.

6.2.3 Where load is transmitted into the transom and/or bottom shell, the thickness of the plating adjacent to the jet unit is to be increased. The increase in thickness is to be not less than 50 per cent of the calculated transom and bottom plating thicknesses respectively or 8 mm, whichever is the greater. Such reinforcement is to extend beyond the surrounding stiffening structure.

6.2.4 For 'bolted in' units, hull receiving rings are to be of a material compatible with the hull. Scantlings of the receiving rings are to be as required by the jet unit manufacturer and suitably edge prepared prior to welding in place. The receiving ring is to be installed using an approved welding procedure. Where a manufacturer's specification is not provided, full details are to be submitted.

6.2.5 Bolt sizes and spacings are to be specified by the manufacturer, and are to be of suitable marine grade, insulated as appropriate and locked by suitable means.

6.2.6 Where studs are proposed for the receiving ring(s), the remaining thickness below the depth of blind tap is to be not less than the bottom shell plating thickness plus 2 mm. Bottoms of all blind taps are to be free of sharp corners.

6.2.7 The use of approved alignment resins may be considered where accurate seating and faying surfaces are required. Details are to be submitted for consideration and approval.

6.2.8 Where a water jet unit forms an integral part of the hull structure, such units are to be installed using an approved weld procedure and in accordance with the manufacturer's instructions. Materials to be welded are to be of compatible specifications.

6.2.9 Water jet units transmitting thrust into the transom structure are to be supported by a system of radial, athwartship and vertical stiffening. Drawings are to be accompanied by a set of detailed structural calculations. Where complex installations are proposed, a finite element model may be submitted in lieu of direct calculations.

6.2.10 Water jet units transmitting thrust to a bottom shell connection or intermediate tunnel connection are to be supported by additional stiffening, the details of which are to be submitted.

Closing Arrangements and Outfit

Volume 1, Part 3, Chapter 4

Sections 1 & 2

Section

- 1 **Introduction**
- 2 **Hatches and miscellaneous openings on the weather deck**
- 3 **Doors and accesses on weather decks**
- 4 **Side lights and windows**
- 5 **Ventilators**
- 6 **Air pipes**
- 7 **Scuppers and sanitary discharges**
- 8 **Bulwarks, guard rails and other means for the protection of crew and embarked personnel**
- 9 **Lagging and lining of structure**

■ Section 1 Introduction

1.1 General

1.1.1 The requirements of this Chapter are applicable to all ship types. If required, reference should be made to any additional or alternative standards that are specified by the Naval Authority which will also be considered. Details are to be submitted.

1.1.2 The requirements of this Chapter are applicable to all openings on the weather deck. Openings on the tops and sides of enclosed structures on the weather deck up to a height of 2,5 m are to be weathertight. In the forward 0,25L_R the height should be taken to 5 m. The height of openings may be required to be increased where this is shown necessary by the stability and watertight subdivision calculation required by Pt 1, Ch 1,1.1. The weather deck as defined in Ch 1,5.4.2 may be stepped or recessed for the purpose of this Chapter. Special consideration will be given to the position of the weather deck of NS1 ship types.

1.1.3 Provisions covering acceptable arrangements for the watertight and weathertight integrity of the hull and spaces within the hull are to be read in conjunction with the limits defined in Ch 1,1.3. For watertight doors and hatches in watertight subdivision boundaries below the vertical extent of watertight integrity, see Ch 2,4.7.

1.1.4 Requirements are given for steel hatches, securing arrangements, coamings, also closing arrangements for other miscellaneous openings, ventilators, air pipes, magazine blow-out plates, discharges and outfit. For side shell doors for main opening and bow doors, see Pt 4, Ch 3.

1.1.5 A boundary or a closing appliance is considered weathertight if it is capable of preventing the passage of water into the ship in any sea condition. Weathertightness can be obtained, by design, where closing arrangements are constructed of steel (or equivalent) and are capable of being closed by clamping devices or bolts. The joining parts are to be gasketed and for all practical purposes have an equivalent structural integrity and tightness to the surrounding structure.

1.1.6 The requirements for closing appliances in this Chapter are suitable for weathertight arrangements. When closing appliances are designed to comply with the requirements for CBRN Defence, they will be considered as being equivalent to the weathertight requirements of this Chapter.

■ Section 2 Hatches and miscellaneous openings on the weather deck

2.1 Hatch covers

2.1.1 The hatch covers on the weather decks of all ships are to be steel plated, stiffened by webs or stiffeners, hinged and secured by clamping devices. Weathertightness is to be achieved by means of gaskets. The means of securing are to be such that weathertightness can be maintained in any sea condition. Where toggles are fitted, their diameter and spacing are to be in accordance with ISO standards or equivalent.

2.1.2 Weathertight or gastight hatches (CBRN) should be located on lower decks in accordance with requirements as specified by the Naval Authority, see Pt 4, Ch 1.

2.1.3 The scantlings of covers are not to be less than the rule thickness for the deck at that point. Where other materials are used, equivalent scantlings are to be provided. The scantlings apply basically to rectangular covers, with the stiffening members arranged primarily in one direction and carrying a uniformly distributed load. The covers are assumed to be simply supported. Where covers are stiffened by a grillage formation, and also where point loads are applied to any type of cover, the scantlings are to be determined from direct calculations.

2.1.4 In the case of flush hatch covers or of covers on coamings of lesser height than required by 2.3.1, their scantlings, the securing and sealing arrangements and the drainage of gutterways will be specially considered.

2.1.5 Where hatchways are trunked through one or more lower decks, and hatchway beams and covers are dispensed with at the intermediate decks, the hatchway beams, coamings and covers immediately below the trunk are to be adequately strengthened. Plans are to be submitted for approval.

2.1.6 Small hatches, including escape hatches are to be situated clear of RAS stores receiving areas and storing routes.

2.1.7 Where portable plates are required in decks for unshipping machinery, or for other similar reasons, they may be accepted provided they are of equivalent strength to the unpierced deck or the surrounding structure is suitably compensated. Portable plates are to be secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters or equivalent naval standard.

2.2 Hatch coamings

2.2.1 The height of coamings above the upper surface of the weather deck, measured above sheathing if fitted, is to be not less than 300 mm. For exposed decks immediately above the design draft, e.g. quarter decks and well decks, coaming heights are to be no less than 600 mm. Coaming of a height no less than 450 mm may be provided if the hatch cover is kept closed and a small access hatch is provided in the hatch cover.

2.2.2 The height of coamings of hatchways closed by steel covers fitted with gaskets and clamping devices are to be as specified in 2.2.1, but may be reduced, or the coamings may be omitted entirely, if the safety of the ship is not thereby impaired in any sea condition. Special attention will be given in such cases to the scantlings of the covers, to their gasketing and securing arrangements and to the drainage of recesses in the deck.

2.2.3 The height of coamings may be required to be increased on ships where this is shown to be necessary by the stability and watertight subdivision calculations required by Ch 2,1.3.

2.2.4 Vertical coamings are to have a thickness, t , in mm not less than the greater of the following:

- (a) $t = 0,008H_c \sqrt{k} + 1,0$ mm
- (b) Rule thickness of the deck in the position fitted where
 - H_c = the coaming height
 - k = local strength steel factor, see Pt 6, Ch 5.

2.2.5 Vertical coamings are to be stiffened at their upper edge by a substantial rolled or fabricated section. Additional support is to be arranged as necessary.

2.3 Manholes and flush escape hatches

2.3.1 Manholes are to be closed by substantial covers capable of being made watertight. The covers are to be permanently attached.

2.3.2 Flush escape hatches are to be closed by substantial weathertight covers capable of being opened and closed from either side except for access to high security areas such as magazines or to prevent access from open decks as agreed with the Naval Authority. The covers are to be permanently attached.

2.4 Hatchways within enclosed superstructures or lower decks

2.4.1 The requirements of this Section are to be complied with where it is necessary to maintain the weathertight envelope.

2.4.2 Access hatches within a superstructure or deck-house need not be provided with means for closing if all openings in the surrounding bulkheads have weathertight closing appliances.

2.5 Magazine blow out plates

2.5.1 Where blow out plates are required they are to be secured by sealing arrangements adequate to meet the weathertightness and operational requirements. They are to be of an equivalent strength to the deck in which they are fitted.

2.5.2 Blow out plates are to be permanently attached.

Section 3 Doors and accesses on weather decks

3.1 General

3.1.1 Access openings in:

- (a) superstructure bulkheads;
- (b) deckhouses protecting openings leading into enclosed superstructures or to spaces below the weather deck; and
- (c) deckhouse on a deckhouse protecting an opening leading to a space below the weather deck,

are to be fitted with doors of steel or other equivalent material, permanently and strongly attached to the bulkhead and framed, stiffened and fitted so that the whole structure is of equivalent strength to the unpierced bulkhead, and weathertight when closed. The doors are to be gasketed and secured weathertight by means of clamping devices or equivalent arrangements, permanently attached to the bulkhead or to the door. Doors are generally to open outwards and are to be capable of being operated and secured from both sides. The sill heights are to be as required by 3.1.3 and 3.1.4.

3.1.2 Fixed lights in doors are to comply with the requirements for side scuttles lights as given in 5.1. Hinged steel deadlights may be external.

3.1.3 The height of doorway sills above the weather deck sheathing, if fitted, is to be not less than 300 mm.

3.1.4 For exposed decks immediately above the design draught, e.g. quarter decks and well decks, sill heights are to be no less than 450 mm.

Closing Arrangements and Outfit

Volume 1, Part 3, Chapter 4

Sections 3 & 4

3.1.5 When the closing appliances of openings in superstructures and deckhouses do not comply with 3.1.1, interior deck openings are to be treated as if exposed on the weather deck.

3.1.6 The height of door sills may be required to be increased on ships where this is shown to be necessary by the stability and watertight subdivision calculations required by Ch 2, 1.2.

3.1.7 Where portable plates are required for unshipping machinery, or for other similar reasons, they may be accepted provided they are of equivalent strength to the unpierced bulkhead and are secured by gaskets and close spaced bolts at a pitch not exceeding five diameters or equivalent naval standard.

3.1.8 The sill heights of accesses closed by covers which are secured by closely spaced bolts or otherwise kept permanently closed at sea will be specially considered.

3.1.9 Special consideration will be given to access on the weatherdeck where for operational purposes it is not possible to provide a sill meeting 3.1.3 or 3.1.4.

3.2 Magazine blow out plates

3.2.1 Where blow out plates are required, they are to be secured by sealing arrangements adequate to meet the weathertightness and operational requirements. They are to be of an equivalent strength to the deck in which they are fitted.

3.2.2 Blow out plates are to be permanently attached.

Section 4 Side lights and windows

4.1 General

4.1.1 Side scuttles are defined as being round or oval openings with an area not exceeding 0,16 m².

4.1.2 Windows are defined as being rectangular openings generally, and round or oval openings with an area exceeding 0,16 m².

4.1.3 A plan showing the location of side lights and windows is to be submitted.

4.1.4 Side lights and windows together with their glasses and deadlights if fitted, are to be of an approved design or in accordance with recognised Naval Authority requirements.

4.1.5 Side lights to spaces within enclosed superstructures, or deckhouses on or above the weather deck are to be fitted with efficient, hinged, inside deadlights and capable of being effectively closed and secured watertight.

4.1.6 All side lights are to be of the non-opening type.

4.1.7 Windows should not generally be fitted in end bulkheads of superstructures.

4.1.8 If fitted in a deckhouse or superstructures in the forward 0,25L_R, windows are to be provided with strong, hinged, steel, weathertight storm covers. However, if there is an opening leading below deck, this opening is to be treated as being on an exposed deck and is to be protected as required by 2.2.1.

4.1.9 Side lights and windows set inboard from the shell on the weather deck, protecting direct access below, are either to be provided with strong permanently attached deadlights or, where they are accessible, strong permanently attached external steel storm covers instead of internal deadlights.

4.1.10 Side lights and windows set inboard from the shell on the weather deck, not protecting direct access below, do not require deadlights or storm covers.

4.1.11 Cabin bulkheads and doors are considered to provide effective protection between side lights or windows and access below.

4.1.12 Where windows are permitted in an exposed bulkhead on the weather deck in the forward 0,25L_R, strong external storm covers which may be portable and stored adjacent are to be provided.

4.1.13 Where the bridge is on, or not more than 5,0 m above, the weather deck in lieu of storm covers being provided for the bridge windows, a weathertight cover, fitted to a coaming of not less than 230 mm in height around the internal stairway opening within the bridge, may be accepted. If this arrangement is accepted, adequate means of draining the bridge are to be provided.

4.1.14 If necessary, for practical considerations, the storm covers may be in two parts.

4.1.15 Laminated toughened safety glass may also be used for windows but the total thickness will need to be greater than that required for the equivalent sized window using toughened safety glass. The equivalent thickness of laminated toughened safety glass is to be determined from the following formula:

$$T_{L1}^2 + T_{L2}^2 + \dots T_{Ln}^2 = T_S^2$$

where

n = number of laminates

T_L = thickness of glass laminate

T_S = thickness of toughened safety glass.

4.1.16 Rubber frames are not acceptable for windows.

Section 5 Ventilators

5.1 Application

5.1.1 This Section applies to all ship types and provides requirements for ventilators. Reference should be made to any additional or alternative standards that are specified by the Naval Authority which will also be considered. Details are to be submitted.

5.1.2 For requirements regarding down flooding in connection with stability and watertight subdivision, see Ch 2,1.3.

5.2 Protection

5.2.1 In all spaces where mechanical damage is likely, all air and sounding pipes, scuppers and discharges, including their valves, controls and indicators, are to be well protected. This protection is to be of steel or other equivalent material.

5.3 General

5.3.1 Special care is to be taken in the design and positioning of ventilator openings and coamings, particularly in the region of the forward end of superstructures and other points of high stress. The deck plating in way of the coamings is to be efficiently stiffened.

5.3.2 Ventilators from tunnels passing through decks are to have scantlings suitable for withstanding the pressures to which they may be subjected and are to be made watertight.

5.4 Coamings

5.4.1 The scantlings and height of ventilator coamings exposed to the weather are to be not less than required by Table 4.5.1 but the thickness need not exceed that of the adjacent deck or bulkhead plating. In particularly exposed positions, the height of coamings and scantlings may be required to be increased.

5.4.2 The height of ventilator coamings may be required to be increased on ships where this is shown to be necessary by the stability and watertight subdivision calculations required by Pt 1, Ch 1,1.1. The Naval Authority may require that the height of all ventilator coamings are above the θ_{df} angle, see Ch 1,1.2.

5.4.3 For gooseneck ventilators, the coaming height is to be measured to the underside of the bend, this being the lowest point through which water on deck could pass freely to spaces below.

5.4.4 Where wall vents are fitted with an internal baffle which rises above the lower edge of the exterior opening, the coaming height is measured to the top of the baffle.

Table 4.5.1 Ventilator coaming requirements

Feature	Requirements
Height (measured above sheathing if fitted)	(1) $z_c = 900$ mm for locations defined in Note 2 $z_c = 760$ mm elsewhere
Thickness	(2) $t_c = 5,5 + 0,01 d_v$ mm where $7,5 \text{ mm} \leq t_c \leq 10,0$ mm
Support	(3) If $z_c > 900$ mm the coaming is to be specially supported
Symbols	
t_c = thickness of coaming, in mm z_c = height of coaming, in mm d_v = internal diameter of coaming, in mm	
NOTES	
1. Where the height of the ventilator exceeds that given in Item (1), the thickness given by (2) may be gradually reduced, above that height, to a minimum of 6,5 mm. The ventilator is to be adequately stayed. 2. For exposed decks immediately above the design waterline, e.g. quarter decks and well decks.	

5.4.5 Ventilator coaming heights may be reduced on ships assigned a service area notation **SA4**. Coaming heights are to be as high as practicable, with a minimum height of 300 mm.

5.5 Closing appliances

5.5.1 All ventilator openings are to be provided with efficient weathertight closing appliances of steel or other equivalent material unless the height of the coaming is greater than 2,5 m above the weather deck or 5 m on exposed deck immediately above the design waterline, e.g. quarter decks and well decks.

5.5.2 Where ventilators are proposed to be led overboard through an enclosed lower deck space the closing arrangements are to be submitted for approval. If such ventilators are led overboard more than 4,5 m above the damage control deck, closing appliances may be omitted, provided that satisfactory baffles and drainage arrangements are provided, as in the case of air intakes or exhaust openings for machinery spaces, which may be arranged in the sides of the ship.

5.5.3 Mushroom ventilators closed by a head revolving on a centre spindle (screw down head) are acceptable, but the diameter is not to exceed 300 mm.

5.5.4 Mushroom ventilators with a fixed head and closed by a screw down plate (screw down cover) may be accepted up to a diameter of 750 mm within the forward $0,25L_R$.

5.5.5 Wall ventilators (jalousies) may be accepted provided they are capable of being closed weathertight by hinged steel gasketed covers secured by bolts or toggles.

5.5.6 A ventilator head not forming part of the closing arrangements is to be not less than 6,5 mm thick.

Closing Arrangements and Outfit

Volume 1, Part 3, Chapter 4

Sections 5, 6 & 7

5.6 Machinery spaces

5.6.1 In general, ventilators necessary to continuously supply the machinery space are to have coamings of sufficient height to comply with 5.5.1 without having to fit weathertight closing appliances. Ventilators to emergency generator rooms are to be so positioned that closing appliances are not required.

5.6.2 Where due to ship size and arrangement this is not practicable, lesser heights for machinery space ventilator coamings fitted with weathertight closing appliances may be permitted by the Naval Authority in combination with other suitable arrangements to ensure uninterrupted, adequate supply of ventilation to these spaces.

Section 6 Air pipes

6.1 General

6.1.1 Air and sounding pipes are to comply with the requirements of Vol 2, Pt 7, Ch 2,10.

6.1.2 Striking plates of suitable thickness, or their equivalent, are to be fitted under all sounding pipes.

6.1.3 Air pipes are to be situated clear of areas where damage may occur, such as RAS landing areas and store routes or helicopter decks.

6.2 Height of air pipes

6.2.1 The height of air pipes from the upper surface of decks exposed to the weather, to the point where water may have access below is normally to be not less than:

- 760 mm on exposed decks immediately above the design draught, e.g. quarter decks and well decks.
- 450 mm measured above deck sheathing, where fitted elsewhere.

6.2.2 Lower heights may be approved in cases where these are essential for the working of the ship, provided that the design and arrangements are otherwise satisfactory. In such cases, efficient, permanently attached closing appliances as required by 6.3.1 are to be of an approved automatic type.

6.2.3 The height of air pipes may be required to be increased on ships where this is shown to be necessary by the stability and watertight subdivision calculations required by Pt 1, Ch 1,1.1. An increase in height may also be required or recommended by Naval Authorities when air pipes to fuel oil and settling tanks are situated in positions where sea water could be temporarily entrapped, e.g. in recesses in the sides and ends of superstructures or deckhouses, between hatch ends, behind high sections of bulwark, etc. This may entail an increase in tank scantlings, see also Pt 6, Ch 3.

6.2.4 Air pipes are generally to be led to an exposed deck. See also Vol 2, Pt 7, Ch 2,10.4.4.

6.2.5 Where air pipes are led through the side of superstructures, the opening is to be at least 2,3 m above the design waterline.

6.2.6 The minimum wall thickness of air pipes in positions indicated in 6.2.1 is to be:

- 6,0 mm for pipes of 80 mm external diameter or smaller.
- 8,5 mm for pipes of 165 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation.

6.2.7 Air pipe coaming heights may be reduced on ships assigned a service area notation **SA4**. Coaming heights are to be as high as practicable, with a minimum height of 300 mm.

6.3 Closing appliances

6.3.1 All openings of air and sounding pipes are to be provided with permanently attached, satisfactory means of closing to prevent the free entry of water (see also 6.2.2 and Vol 2, Pt 7, Ch 2,10.6.2).

6.3.2 Closing appliances are to be of an approved automatic type.

Section 7 Scuppers and sanitary discharges

7.1 General

7.1.1 Scuppers sufficient in number and size to provide effective drainage are to be fitted in all decks.

7.1.2 Scuppers draining weather decks and spaces within superstructures or deckhouses not fitted with efficient weathertight doors are to be led overboard.

7.1.3 Where the freeboard is such that the deck edge forming the vertical limit of watertight integrity is immersed when the ship heels 5° or less, scuppers and discharges which drain spaces below this deck, or spaces within intact superstructures or deckhouses on this deck fitted with efficient weathertight doors, may be led to the bilges in the case of scuppers or to suitable sanitary tanks in the case of sanitary discharges. Where the freeboard is such that the deck edge forming the vertical limit of watertight integrity is immersed when the ship heels greater than 5° then they are to be led overboard and fitted with means of preventing water from passing inboard in accordance with 7.2.

7.1.4 In ships where an approved fixed pressure water spray fire-extinguishing system is fitted in vehicle, magazines or hangar spaces, deck scuppers of not less than 150 mm diameter are to be provided port and starboard, spaced about 9,0 m apart. Where the design capacity of the drencher system exceeds an application of water at a rate 5 litres per square metre of deck area per by 10 per cent or more, the scupper area will require to be increased accordingly. After installation the two adjacent sections with the greatest aggregate drencher capacity are to be tested in operation to ensure that there is no build-up of water on the deck. The mouth of the scupper is to be protected by bars.

7.1.5 Where a sewage system is fitted, the shipside valves on the discharge pipe from the effluent tank(s) and the by-pass system are to comply with 7.2.

7.1.6 The minimum wall thickness of pipes not indicated in 7.2.6 is to be:

- 4,5 mm for pipes of 155 mm external diameter or smaller.
- 6,0 mm for pipes of 230 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation.

7.1.7 For the use of non-metallic pipe, see Vol 2, Pt 7, Ch 1,11.

7.1.8 Scuppers and discharge pipes should not normally pass through oil fuel tanks. Where scuppers and discharge pipes pass, unavoidably, through oil fuel tanks, and are led through the shell within the tanks, the thickness of the piping should be at least the same thickness as Rule shell plating in way, derived from the appropriate Chapters, but need not exceed 19 mm.

7.1.9 Piping within tanks is to be tested in accordance with the Naval Ship Survey Procedures Manual.

7.1.10 All piping is to be adequately supported.

7.2 Closing appliances

7.2.1 In general, each separate overboard discharge is to be fitted with a screw-down non-return valve capable of being operated from a position always accessible and above the damage control deck. An indicator is to be fitted at the control position showing whether the valve is open or closed. A machinery space, whether manned or unattended (i.e. with **UMS** notation), is considered accessible. Spaces with access only by bolted manholes are not considered accessible.

7.2.2 Where an approved fire pressure waterspray fire-extinguishing system is provided in an enclosed vehicle space, magazines or hangar spaces, the scupper controls are to be operated from a position above the damage control deck, and outside the space protected by the fire-extinguishing system, and are to be protected from mechanical damage.

7.2.3 Where the vertical distance from the design draught to the inboard end of the discharge pipe exceeds $0,01L_R$ the discharge may be fitted with two automatic non-return valves without positive means of closing, instead of the screw-down non-return valve, provided that the inboard valve is always accessible for examination under service conditions.

7.2.4 Where the vertical distance from the design waterline to the inboard end of the discharge pipe exceeds $0,02L_R$, a single automatic non-return valve without positive means of closing may be fitted, see Fig. 4.7.1.

7.2.5 The requirements for non-return valves are applicable only to those discharges which remain open during the normal operation of the ship. For discharges which are closed at sea, a single screw down valve operated from the weather deck is considered to provide sufficient protection.

7.2.6 Scuppers and discharge pipes originating at any level which penetrate the shell either more than 450 mm below the deck forming the vertical limit of watertight integrity or less than 600 mm above the deep draught waterline, are to be fitted with an automatic non-return valve at the shell. This valve, unless required by 7.1.3, may be omitted provided the piping has a minimum wall thickness of:

- 7,0 mm for pipes of 80 mm external diameter or smaller.
- 10,0 mm for pipes of 180 mm external diameter.
- 12,5 mm for pipes of 220 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation. Unless required by 7.1.8, the maximum thickness need not exceed 12,5 mm.

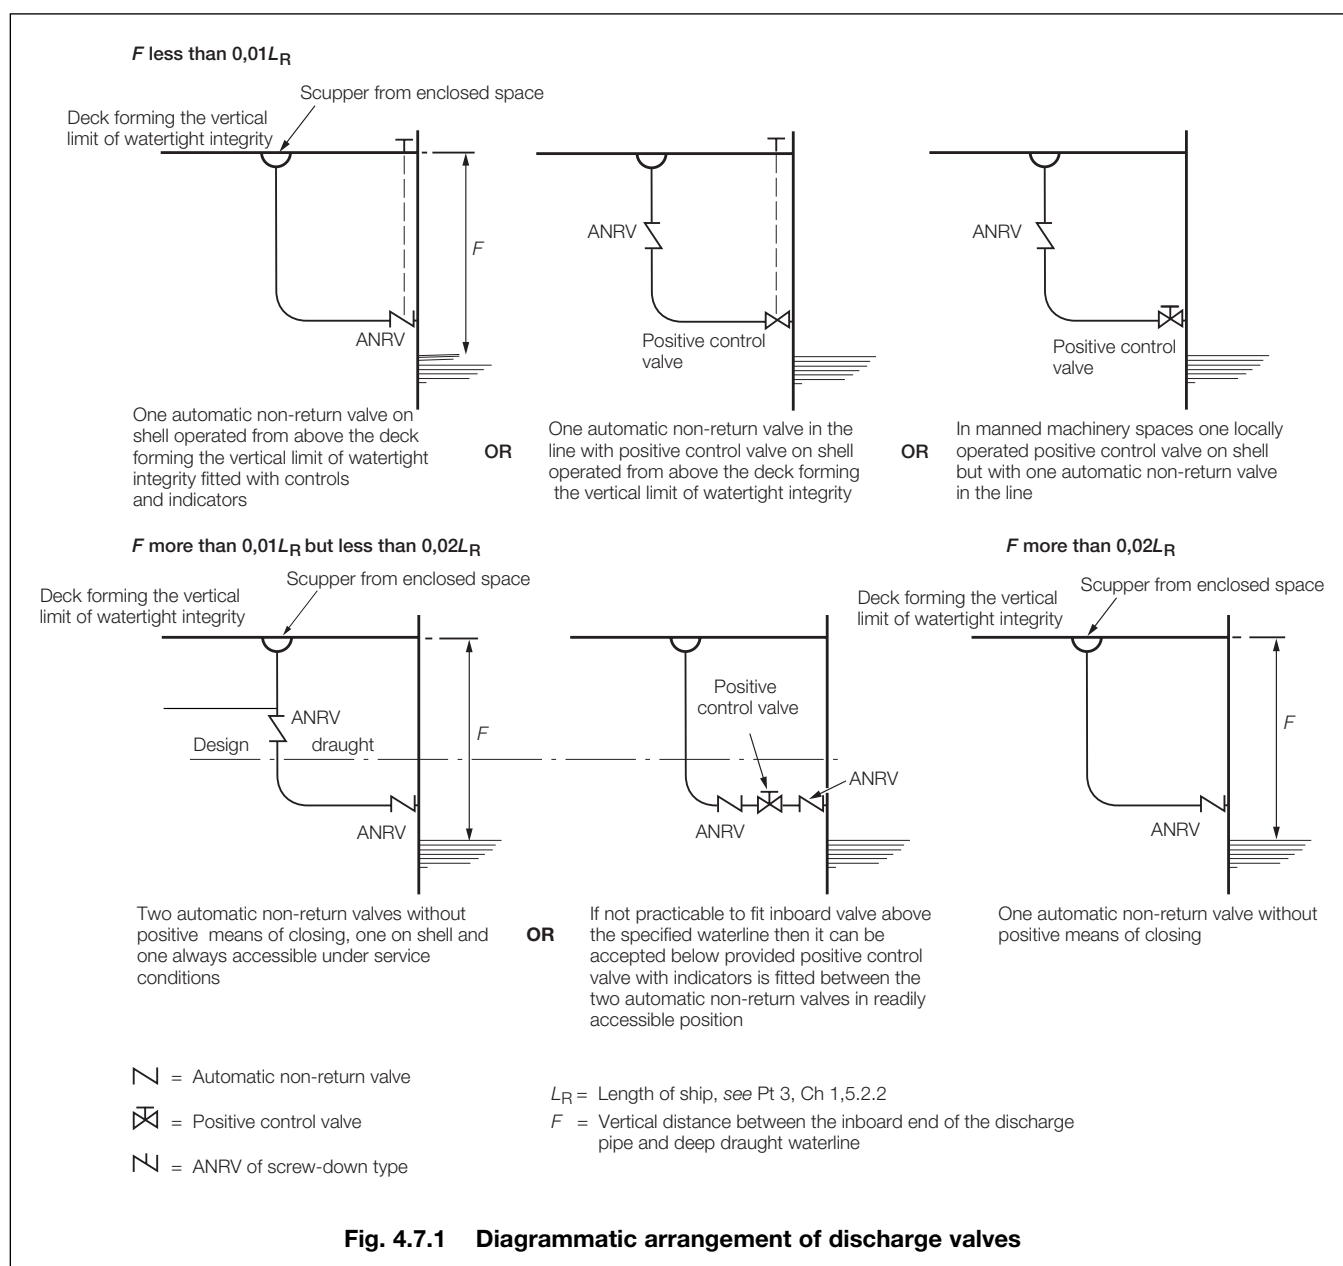

7.2.7 The outboard valve is to be mounted directly on the shell and secured in accordance with Vol 2, Pt 7, Ch 1. If this is impracticable, a short distance piece of rigid construction may be introduced between the valve and the shell.

7.2.8 If a valve is required by 7.1.3, this valve should preferably be fitted as close as possible to the point of entry of the pipe into the tank. If fitted below the weather deck, the valve is to be capable of being controlled from an easily accessible position above the weather deck. Local control is also to be arranged, unless the valve is inaccessible. An indicator is to be fitted at the control position showing whether the valve is open or closed.

7.2.9 Valves for maintaining watertight integrity such as ship side valves and their fittings (other than those on scuppers and sanitary discharges), are to comply with the requirements of Vol 2, Pt 7, Ch 1 and Ch 2.

7.3 Rubbish chutes and similar discharges

7.3.1 Rubbish chutes and similar discharges should be constructed of mild steel piping or plating of shell thickness. Other materials will be specially considered. Openings are to be kept clear of the sheerstrake and areas of high stress concentration.

7.3.2 Rubbish chute hoppers are to be provided with a hinged weathertight cover at the inboard end with an interlock so that the discharge flap and hopper cover cannot be open at the same time. The hopper cover is to be secured closed when not in use, and a suitable notice displayed at the control position.

7.3.3 Where the inboard end of the hopper is less than $0,01L_R$ above the design draught, a suitable valve with positive means for closing is to be provided in addition to the cover and flap in an easily accessible position above the design draught. The valve is to be controlled from a position adjacent to the hopper and provided with an open/shut indicator. The valve is to be kept closed when not in use, and a suitable notice displayed at the valve operating position.

7.4 Materials for valves, fittings and pipes

7.4.1 All shell fittings and valves required by 7.2 are to be of steel, bronze or other approved ductile material; ordinary cast iron or similar material is not acceptable. Materials are to satisfy the requirements of the *Rules for the Manufacture, Testing and Certification of Materials*.

7.4.2 All these items, if made of steel or other approved material with low corrosion resistance, are to be suitably protected against wastage.

7.4.3 The lengths of pipe attached to the shell fittings, elbow pieces or valves are to be of galvanised steel or other equivalent approved material.

■ Section 8 Bulwarks, guard rails and other means for the protection of crew and embarked personnel

8.1 General requirements

8.1.1 Bulwarks or guard rails are to be provided at the boundaries of exposed decks. Bulwarks or guard rails are to be not less than 1,0 m in height measured above sheathing, and are to be constructed as required by this Section. Consideration will be given to cases where this height would interfere with the normal operation of the ship. Guard rails provided around aircraft operating areas may be of the type which drop outwards with nets to the satisfaction of the Naval Authority, provided access is restricted to essential personnel. Where bulwarks or rails are undesirable, e.g. for radar signature purposes, alternative equivalent arrangements will require to be provided.

8.1.2 The freeing arrangements in bulwarks are to be in accordance with 8.3.

8.1.3 Guard rails fitted on superstructure and exposed decks are to have at least three courses. The opening below the lowest course of guard rails is not to exceed 230 mm. The other courses are to be spaced not more than 380 mm apart. In the case of ships with rounded gunwales, the guard rail supports are to be placed on the flat of the deck. In other locations, guard rails with at least two courses are to be fitted.

8.1.4 Guard rails are to be fitted with fixed, removable or hinged stanchions fitted no more than 1,5 m apart. Removable or hinged stanchions shall be capable of being locked in the upright position.

8.1.5 At least every third stanchion is to be supported by a stay.

8.1.6 Where necessary for the normal operation of the ship, steel wire ropes may be accepted in lieu of guard rails. Wires are to be made taut by means of turnbuckles. Chains are only permitted in short lengths in way of access openings.

8.1.7 Satisfactory means, in the form of guard rails, lifelines, handrails, gangways, underdeck passageways or other equivalent arrangements, are to be provided for the protection of the crew and embarked personnel in getting to and from their quarters, the machinery space and all other parts used in the necessary operation of the ship. Where a well-lighted and ventilated underdeck passage (clear opening 0,8 m wide, 2 m high) is provided it is to be as close as practicable to the weather deck, connecting and providing access to the following locations:

- between superstructures;
- from forward and aft superstructures to the fore end and aft end respectively.

8.1.8 Gangways or walkways may be omitted on ships assigned a service area notation **SA4**.

8.2 Bulwark construction

8.2.1 Plate bulwarks are to be stiffened by a strong rail section and supported by stays from the deck. The spacing of these stays forward of $0,93L_R$ is to be not more than 1,2 m. Elsewhere, bulwark stays are to be not more than 1,83 m apart. Where bulwarks are cut to form a gangway or other opening, stays of increased strength are to be fitted at the ends of the openings. Bulwarks are to be adequately strengthened in way of eyeplates for RAS points, and in way of mooring pipes the plating is to be doubled or increased in thickness and adequately stiffened.

8.2.2 Bulwarks should not be cut for gangway or other openings near the breaks of superstructures, and are also to be arranged to ensure their freedom from main structural stresses. See shell plating in appropriate Chapters.

8.2.3 The section modulus, Z , at the bottom of the bulwark stay is to be not less than:

$$Z = (33,0 + 0,44L) h^2 s \text{ cm}^3$$

where

h = height of bulwark from the top of the deck plating to the top of the rail, in metres

s = spacing of the stays, in metres, in accordance with 9.2.1

L_R = length of ship, in metres (as defined in Ch 1,5.1), but to be not greater than 100 m.

8.2.4 In the calculation of the section modulus, only the material connected to the deck is to be included. The bulb or flange of the stay may be taken into account where connected to the deck, and where, at the ends of the ship, the bulwark plating is connected to the sheerstrake, a width of plating not exceeding 600 mm may also be included. The free edge of the stay is to be stiffened.

8.2.5 Bulwark stays are to be supported by, or to be in line with, suitable underdeck stiffening, which is to be connected by double continuous fillet welds in way of the bulwark stay connection.

8.3 Freeing arrangements

8.3.1 The following requirements are applicable to all ship types.

8.3.2 Where bulwarks on the weather decks or superstructure decks form wells, ample provision is to be made for rapidly freeing the decks of large quantities of water by means of freeing ports, and also for draining them.

8.3.3 The minimum freeing area on each side of the ship, for each well on the weather deck is to be derived from the following formulae:

(a) where the length, l , of the bulwark in the well is 20 m or less: area required = $0,7 + 0,035l \text{ m}^2$

(b) where the length, l , exceeds 20 m area required = $0,07l \text{ m}^2$

l need not be taken greater than $0,7L_R$, where L_R is the length of the ship as defined in Ch 1,5.2.

Closing Arrangements and Outfit

Volume 1, Part 3, Chapter 4

Section 8

8.3.4 If the average height of the bulwark exceeds 1,2 m or is less than 0,9 m, the freeing area is to be increased or decreased, respectively, by 0,004 m² per metre of length of well for each 0,1 m increase or decrease in height respectively.

8.3.5 The minimum freeing area for each well on a superstructure is to be half the area calculated from 8.3.3.

8.3.6 Two-thirds of the freeing port area required is to be provided in the half of the well nearest to the lowest point of the sheer curve.

8.3.7 When the deck has little or no sheer, the freeing area is to be spread along the length of the well.

8.3.8 In ships with no sheer the freeing area as calculated from 8.3.3 is to be increased by 50 per cent. Where the sheer is less than the standard, as given in Table 4.8.1, the percentage is to be obtained by linear interpolation.

Table 4.8.1 Standard sheer profile

Position from A.P.	Ordinate (in mm)
A.P.	$25 \left(\frac{L_R}{3} + 10 \right)$
0,16L _R	$11,1 \left(\frac{L_R}{3} + 10 \right)$
0,33L _R	$2,8 \left(\frac{L_R}{3} + 10 \right)$
0,5L _R	0
0,67L _R	$5,6 \left(\frac{L_R}{3} + 10 \right)$
0,83L _R	$22,2 \left(\frac{L_R}{3} + 10 \right)$
F.P.	$50 \left(\frac{L_R}{3} + 10 \right)$
NOTES 1. Sheer is measured from the deck at side to a line drawn parallel to the keel through the sheer line amidships. 2. In ships with a rake of keel, the sheer is measured in relation to a reference line drawn parallel to the design waterline.	

8.3.9 Where the length of the well is less than 10 m, or where a deckhouse occupies most of the length, the freeing port area will be specially considered but in general need not exceed 10 per cent of the bulwark area.

8.3.10 Where it is not practical to provide sufficient freeing port area in the bulwark, particularly in small ships, credit can be given for bollard and fairlead openings where these extend to the deck.

8.3.11 Where a deckhouse has a breadth less than 80 per cent of the beam of the ship, or the width of the side passageways exceed 1,5 m, the arrangement is considered as one well. Where a deckhouse has a breadth equal to or more than 80 per cent of the beam, *B*, of the ship, or the width of the side passageways does not exceed 1,5 m, or when a screen bulkhead is fitted across the full breadth of the ship, this arrangement is considered as two wells, before and abaft the deckhouse.

8.3.12 Suitable provision is also to be made for the rapid freeing of water from recesses formed by superstructures and deckhouses, etc., in which water may be shipped and trapped. Deck gear is not to be stowed in such a manner as to obstruct unduly the flow of water to freeing ports.

8.3.13 The lower edges of freeing ports are to be as near to the deck as practicable, and should not be more than 100 mm above the deck.

8.3.14 Where freeing ports are more than 230 mm high, vertical bars spaced 230 mm apart may be accepted as an alternative to a horizontal rail to limit the height of the freeing port.

8.3.15 Where shutters are fitted, the pins or bearings are to be of a non-corrodible material, with ample clearance to prevent jamming. The hinges are to be within the upper third of the port. Shutters are not to be fitted with securing appliances.

8.3.16 All ships are to have open rails for at least half the length of the exposed part of the weather deck. Alternatively, if a continuous bulwark is fitted, the minimum freeing area is to be at least 33 per cent of the total area of the bulwark. The freeing area is to be placed in the lower part of the bulwark.

8.3.17 In ships having superstructures which are open at either or both ends to wells formed by bulwarks on the open deck, adequate provision for freeing the open spaces are to be provided as follows:

The freeing port area, *A_w* for the open well:

$$A_w = (0,07l_w + A_c) (S_c) \left(\frac{0,5h_s}{h_w} \right)$$

The freeing port area, *A_s* for the open superstructure:

$$A_s = (0,07l_t) (S_c) \left(\frac{b_o}{l_t} \left(1 - \left(\frac{l_w}{l_t} \right)^2 \right) \left(\frac{0,5h_s}{h_w} \right) \right)$$

where

l_w = the length of the open deck enclosed by bulwarks, in metres

l_s = the length of the common space within the open superstructure, in metres

l_t = *l_w* + *l_s* but if 20 m or less then the freeing area is to be calculated in accordance with 8.3.3(a)

S_c = sheer correction factor, maximum 1,5 as defined in 8.3.8

b_o = breadth of openings in the end bulkhead of the enclosed superstructure, in metres

h_w = distance of the well deck above the freeboard deck, in metres

h_s = one standard superstructure height

h_b = actual height of the bulwark, in metres.

A_c = bulwark height correction factor taken as;
 = 0 for bulwarks between 0,9 and 1,2 m in height
 $= 0,004 l_w \left(\frac{(h_b - 1,2)}{1,0} \right) m^2$
 for bulwarks of height greater than 1,2 m, and
 $= 0,004 l_w \left(\frac{(h_b - 0,9)}{1,0} \right) m^2$
 for bulwarks of height less than 0,9 m.

8.3.18 Where a ship operates for extended periods in a cold weather environment, see Pt 5, Ch 2,4.2.3, closing devices fitted to freeing port arrangements are to remain effective. The arrangement will be specially considered.

8.4 Free flow area

8.4.1 The effectiveness of the freeing port area in bulwarks of vessels not fitted with a continuous deck obstruction, depends on the free flow across the deck.

8.4.2 The free flow area is the net total longitudinal area of the transverse passageways or gaps between hatchways and superstructures or deckhouses, due account being made for any obstructions such as equipment or other fittings. The height of passageways or gaps used in the calculation of the area is the height of the bulwark.

■ Section 9 Lagging and lining of structure

9.1 General

9.1.1 Suspended floors are to be fitted and secured in such a manner as to provide access to the structure and fittings below.

9.2 Removal for access

9.2.1 It is recommended that the cabin fittings and linings against the side of the ship be so fitted as to be capable of being removed when necessary. The method of attachment is not to impair the strength of the structural members.

9.2.2 Removable linings are to be fitted in areas prone to high structural degradation and areas that are critical to the structural integrity of the hull, to permit examination of these areas.

9.2.3 Decorative linings are to be manufactured of materials resistant to secondary fragmentation and combustion.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

Sections 1, 2 & 3

Section

- 1 **General**
- 2 **Equipment Number**
- 3 **Service area factors**
- 4 **Anchors**
- 5 **Anchor cable**
- 6 **Mooring ropes**
- 7 **Towing arrangements**
- 8 **Windlass and capstan design and testing**
- 9 **Structural details**
- 10 **Launch and recovery, berthing and docking arrangements**

■ Section 1 General

1.1 Application

1.1.1 The anchoring equipment specified in this Section is suitable for ships designed for unrestricted service.

1.2 Definitions

1.2.1 The definitions for use throughout this Chapter are as indicated in the appropriate Section.

1.3 Character of classification

1.3.1 For classification purposes the character figure **1**, or the character letter **E**, is to be assigned.

1.3.2 To entitle a ship to the character **1** in its classification symbol, equipment in accordance with the requirements of Sections 4, 5, 6, 8 and 9 are to be provided. The regulations governing the assignment of the character figure **1** for equipment are given in Pt 1, Ch 2.

1.3.3 Where Lloyd's Register (hereinafter referred to as 'LR') has agreed that anchoring and mooring equipment, as defined in 1.3.2, need not be fitted in view of the particular service of the ship, the character letter **E** will be assigned. See also Pt 1, Ch 2.

1.3.4 For ships intended to be operated only in suitable areas or conditions, other than those included in this Section, which have been agreed by LR, (as defined in Pt 1, Ch 2,3.5) equipment differing from these requirements may be approved if considered suitable for the particular service on which the ship is to be engaged.

■ Section 2 Equipment Number

2.1 Equipment Number calculation

2.1.1 The anchoring and mooring equipment specified in this Section is based on an 'Equipment Number' which is to be calculated as follows:

$$\text{Equipment Number} = \Delta^{2/3} + 2,5A_t + A/10$$

where

A = area, in m^2 , in profile view, of the hull, superstructures, houses, masts, etc. above the design draught which are within the Rule length of the vessel and also have a breadth greater than $B/4$. See also 2.1.2

A_t = transverse projected area, in m^2 , of the hull and of all superstructures, houses, masts, etc., above the design draught

Δ = displacement, in tonnes, of the ship at its deep draft waterline.

2.1.2 Screens and bulwarks more than 1,5 m in height are to be regarded as parts of houses when determining A . Where a screen or bulwark is of varying height, the portion to be included is to be that length the height of which exceeds 1,5 m.

2.1.3 For ships which have a complex above water transverse profile due to the presence of large plated masts, mast trees, large radar equipment, etc., the equipment number may need to be specially considered.

2.2 Novel ship design

2.2.1 Where a ship is of unusual form and proportions the requirement for equipment will be individually considered on the basis of the Rules.

■ Section 3 Service area factors

3.1 General

3.1.1 For details of the service areas referred to in this Section, see Pt 5, Ch 2,2.2.

3.2 Service Areas SA1, SA2, SA3, SA4, SAR

3.2.1 For ships designed to operate in any service area, the equipment is to be in accordance with the requirements of Tables 5.4.1 and 5.6.1.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

Section 4

■ Section 4 Anchors

4.1 General

4.1.1 The Rules are based on the use of high holding power (HHP) type anchors.

4.1.2 When ordinary holding power anchors are used as bower anchors, the mass given in Table 5.4.1 is to be increased by 33 per cent.

4.1.3 Where it is proposed to fit other types of anchor, the mass will be specially considered.

4.1.4 Ships are to be provided with the number of anchors specified in Table 5.4.1 which must be ready for immediate use. Where this is impractical, see 9.3.4, special consideration may be given to only having one anchor ready for immediate use.

4.1.5 Where a high degree of redundancy in propulsion and steering and where the engine can be brought to readiness quickly, consideration may be given to the fitting of a single anchor where Table 5.4.1 requires the fitting of two anchors, where acceptable to the Naval Authority.

4.1.6 Anchors are to be of an approved design. The design of all anchor heads is to be such as to minimise stress concentrations, and in particular, the radii on all parts of cast anchor heads are to be as large as possible, especially where there is considerable change of section.

4.1.7 Anchors which must be specially laid the right way up, or which require the fluke angle or profile to be adjusted for varying types of sea bed, will not generally be approved for normal ship use, but may be accepted for offshore units, floating cranes, etc. In such cases suitable tests may be required.

4.1.8 Where ships are required by the Naval Authority to be fitted with kedge anchors they are to be in accordance with Table 5.6.1.

4.2 Manufacture and testing of anchors

4.2.1 The requirements for the manufacture, testing and certification of anchors are contained in Chapter 10 of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

4.3 Anchor stowage

4.3.1 Anchors are generally to be housed in suitable hawse pipes, or stowed in dedicated chocks on deck.

4.3.2 Hawse pipes and anchor pockets are to be in accordance with 8.3. Alternatively, roller fairleads of suitable design may be fitted. Where hawse pipes are not fitted, alternative arrangements will be specially considered.

4.4 High Holding Power (HHP) type anchors

4.4.1 Anchors of designs for which approval is sought as high holding power anchors are to be tested in accordance with Chapter 10 of the Rules for Materials.

4.5 Super High Holding Power (SHHP) type anchors

4.5.1 Proposals to use anchors of the SHHP type will be subject to special consideration.

4.5.2 Final acceptance will be dependent upon satisfactory strength and performance tests.

4.5.3 Anchors of designs for which approval is sought as super high holding power anchors are to be tested at sea to show that they have holding powers of at least four times those of approved standard stockless anchors of the same mass.

4.6 Tolerances

4.6.1 The mass of each bower anchor given in Table 5.4.1 is for anchors of equal mass. The masses of individual anchors may vary by ± 7 per cent of the masses given in the Table, provided that the total mass of the anchors is not less than would have been required for anchors of equal mass.

4.6.2 The mass of the head, including pins and fittings, of an ordinary stockless anchor is to be not less than 60 per cent of the total mass of the anchor.

4.6.3 When stocked bower or kedge anchors are to be used, the mass 'ex stock' is to be not less than 80 per cent of the mass given in Table 5.4.1 for ordinary stockless bower anchors and Table 5.6.1 for kedge anchors. The mass of the stock is to be 25 per cent of the total mass of the anchor, including the shackle, etc., but excluding the stock.

4.7 Identification

4.7.1 Identification of anchors which have been tested is to be in accordance with Chapter 10 of the Rules for Materials.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

Sections 5 & 6

■ Section 5

Anchor cable

5.1 General

5.1.1 Anchor cable may be of stud link chain, short link chain, wire rope or fibre rope, subject to the requirements of this Section.

5.2 Chain cable

5.2.1 The length and diameter of chain cable is to be as indicated in Table 5.4.1.

5.2.2 Short link chain cable may be accepted provided that the breaking load is not less than that of stud link chain cable of the diameter required by Table 5.4.1.

5.2.3 Chain cables are to be steel in accordance with the requirements of Chapter 10 of the Rules for Materials.

5.2.4 Grade U1 material having a tensile strength of less than 400 N/mm² is not to be used in association with high holding power anchors. Grade U3 material is to be used only for chain 20,5 mm or more in diameter.

5.2.5 In addition to 5.2.3 special consideration will be given to the use of chain cable of alloy steel. Alloy steel is to be of a suitable type, details of which are to be submitted for consideration.

5.2.6 The form and proportion of links and shackles are to be in accordance with Chapter 10 of the Rules for Materials.

5.2.7 Where kedge anchors are used in association with chain cable, this cable may be either stud link or short link.

5.2.8 Test certificates issued in accordance with Chapter 10 of the Rules for Materials are to be signed by the Surveyors when the cables are placed on board the ship.

5.2.9 Arrangements are to be provided for the safe use of cable when mooring to a buoy, securing alongside hazardous or exposed jetties or preparing to be towed. Alternative arrangements to meet these requirements without the use of cable are to be submitted for consideration.

5.3 Wire rope

5.3.1 Steel wire ropes are to be manufactured, tested and certified as required by Chapter 10 of the Rules for Materials.

5.4 Cable clench

5.4.1 Provision is to be made for securing the inboard ends of the cables to the structure. This attachment should have a working strength of not less than 63,7 kN or 10 per cent of the breaking strength of the chain cable, whichever is the greater, and the structure to which it is attached is to be adequate for this load. Attention is drawn to the advantages of arranging that the cable may be slipped from an accessible position outside the chain cable locker. The proposed arrangement for slipping the chain cable, if constructed outside the chain locker, must be made watertight.

5.5 Cable stopping and release arrangements

5.5.1 It is recommended that suitable bow chain stoppers be provided. The scantlings of these chain stoppers are outside the scope of the Rules, however the structure in way is to be designed with due regard to the applied loading. Support under chain stopping arrangements is to be to the satisfaction of the Surveyor.

5.6 Cable locker

5.6.1 Adequate storage is to be provided to accommodate the full length of anchor cable.

5.6.2 The chain locker is to be of a capacity and depth adequate to provide an easy direct lead for the cable into the chain pipes, when the cable is fully stowed. Chain or spurling pipes are to be of suitable size and provided with chafing lips. The port and starboard cables are to be separated by a division in the locker.

5.6.3 Chain lockers fitted abaft the collision bulkhead are to be weathertight and the space to be efficiently drained.

■ Section 6

Mooring ropes

6.1 Mooring ropes

6.1.1 Ships under 90 m require mooring lines as specified in Table 5.6.1.

6.1.2 The lengths of individual mooring lines in Table 5.6.1 may be reduced by up to seven per cent of the Table length, provided that the total length of mooring lines is not less than would have resulted had all lines been of equal length. Proposals to fit individual mooring lines of reduced length to suit the particular service will be specially considered.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

Section 6

6.1.3 Ships 90 m and over in length do not require mooring lines as a classification item. It is recommended, however, that the sum of the strengths of all the mooring lines supplied to such ships should be not less than the Rule breaking load of one anchor cable as required by Table 5.4.1, based on Grade U2 chain. On ships regularly using exposed berths, twice the above total strength of mooring ropes is desirable.

6.1.4 It is recommended that not less than four mooring lines be carried on ships exceeding 90 m in length, and not less than six mooring lines on ships exceeding 180 m in length. The length of mooring lines should be not less than 200 m, or the length of the ship, whichever is the lesser.

6.1.5 For ease of handling, fibre ropes should be not less than 20 mm diameter. All ropes having breaking strengths in excess of 736,0 kN and used in normal mooring operations are to be handled by, and stored on, suitably designed winches. Alternative methods of storing should give due consideration to the difficulties experienced in manually handling ropes having breaking strengths in excess of 490,0 kN.

6.2 Materials

6.2.1 Mooring lines may be of steel wire rope, natural fibre or synthetic fibre. The diameter, construction and specification of wire or natural fibre mooring lines are to comply with the requirements of Chapter 10 of the Rules for Materials. Where it is proposed to use synthetic fibre ropes, the size and construction will be specially considered.

6.2.2 The design loads applied to deck fittings by 6.6 relate to conventional fibre ropes (i.e. polypropylene, polyester and nylon). If other materials are used i.e. HMPE, consideration should be given to the elongation properties and therefore the design load applied to deck fittings.

6.2.3 Wire rope mooring lines used in association with winches (on which the rope is stored on the winch drum) are to be of suitable construction.

6.3 Testing and certification

6.3.1 Mooring ropes are to be tested and certified in accordance with Chapter 10 of the Rules for Materials.

6.4 Bollards, fairleads and bull rings

6.4.1 Means are to be provided to enable mooring lines to be adequately secured on board ship.

6.4.2 It is recommended that the total number of suitably placed bollards on either side of the ship and/or the total brake holding power of mooring winches should be capable of holding not less than 1,5 times the sum of the maximum breaking strengths of the mooring lines required or recommended.

6.4.3 Bollards, fairleads and bull rings are to be located on longitudinals, beams and/or girders, which are part of the deck construction so as to facilitate efficient distribution of the mooring load. Other equivalent arrangements (Panama chocks, etc.) will be considered providing the strength is confirmed as adequate for the intended use.

6.4.4 It is recommended that shipboard fittings are selected in accordance with an Industry standard (e.g. ISO3913 Shipbuilding Welded Steel Bollards) accepted by the Society. When the shipboard fitting is not selected from an accepted Industry standard, the design load used to assess its strength and its attachment to the ship is to be in accordance with 6.6.3 and the design is to be submitted for approval.

6.4.5 The SWL of each shipboard fitting is not to exceed 80 per cent of the design load as per 6.6.3. It is to be marked (by weld bead or equivalent) on the deck fittings used for mooring. The SWL with its intended use is to be noted in the mooring arrangement plan or other information available on board for the guidance of the Master. These requirements for SWL apply for a single post basis (no more than one turn of one cable). The arrangement plan is to explicitly prohibit the use of mooring lines outside of their intended function.

6.5 Mooring winches

6.5.1 Mooring winches where provided are to be suitable for the intended purpose.

6.5.2 Mooring winches are to be fitted with drum brakes, the strength of which is sufficient to prevent unreeling of the mooring line when the rope tension is equal to 80 per cent of the breaking strength of the rope as fitted on the first layer on the winch drum.

6.6 Support structure of deck fittings

6.6.1 Plans are to be of sufficient detail for plan approval purposes. Plans covering the following items are to be submitted for approval:

- Strong points, bollards and fairleads, see 6.4.4.
- Support structure and foundations of towing equipment.

6.6.2 A mooring arrangements plan is to be submitted for information and is to include the following in respect of each shipboard fitting:

- Location on the ship.
- Fitting type.
- Safe working load (SWL).
- Purpose of fitting (mooring/harbour towing/escort towing).
- Manner of applying towing or mooring line load, including limiting fleet angles.

A mooring arrangement plan is to be provided on board the ship for the guidance of the Master.

6.6.3 The design load to be applied to the supporting structure of mooring fittings is to be 1,25 times the minimum breaking strength of the mooring line according to Table 5.6.1 for the ship's corresponding equipment number. If a greater design load is specified by the Naval Authority this load is to be used.

NOTES

1. The rope used for kedge anchor wire is to be constructed of not less than 72 wires, made up into six strands.
2. Steel wire and fibre ropes used for mooring lines and kedge anchors are to meet the requirements of Ch 10,6 and 7 of the Rules for Materials respectively.
3. Wire ropes for mooring lines used in association with mooring winches (on which the rope is stored on the winch drum) are to be of suitable construction.
4. Irrespective of strength requirements, no fibre rope is to be less than 20 mm diameter.

6.6.4 The design load to be applied to the supporting structure of winches is to be 1,25 times the rated maximum holding power of the winch or the rated maximum pull power, whichever is greater.

6.6.5 The design load is to be applied according to the arrangement shown on the mooring arrangement plan. The point of action of the force on the fitting is to be taken as the point of attachment of the mooring line or towline or at a change in its direction. The total design load applied to a fitting need not be more than twice the design load, see Fig. 5.7.1.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

Sections 6 & 7

6.6.6 The reinforced members (carling) beneath shipboard fittings are to be effectively arranged for any variation of direction (horizontally and vertically) of the mooring forces (which is to be not less than the design load) acting through the arrangement of connection to the shipboard fittings. Other arrangements will be specially considered, provided that the strength is confirmed as adequate for the service.

6.6.7 The stresses in shipboard fittings associated with mooring are not to exceed the specified minimum yield stress of the material in bending and 60 per cent of the specified minimum yield stress of the material in shear considering the design load.

Section 7 Towing arrangements

7.1 Definition

7.1.1 Towing can be defined as either receiving motive assistance from, or rendering it to, another vessel.

7.2 Application

7.2.1 The towing arrangements specified in this Section are applicable to NS1, NS2 and NS3 category ships carrying the corresponding optional towing arrangement notation.

7.2.2 The strength of strong points, fittings and machinery are to be proof tested unless type approved.

7.2.3 In general, ships complying with the requirements of this Section will be eligible to be classed with the notation **TA1**, **TA2** or **TA3**.

7.2.4 **TA1** This notation will be assigned when an appraisal has been made of the towing arrangements and strength performance of the supporting structures in accordance with the Rules. This notation recognises the most severe weather conditions, see Tables 5.7.2 and 5.7.3.

7.2.5 **TA2** This notation will be assigned when an appraisal has been made of the towing arrangements and strength performance of the supporting structures in accordance with the Rules. This notation recognises weather conditions less severe than **TA1**, see Tables 5.7.2 and 5.7.3.

7.2.6 **TA3** This notation will be assigned when an appraisal has been made of the towing arrangements and strength performance of the supporting structures in accordance with the Rules. This notation recognises the least severe weather conditions, see Tables 5.7.2 and 5.7.3.

7.2.7 These three levels of towing arrangements in 7.2.4 to 7.2.6 recognise towing a ship of similar displacement at 6 knots in defined environmental conditions (see Table 5.7.3) and are appropriate for the weather conditions found in the equivalent service areas, i.e., **TA1** corresponds to the weather conditions found with service area notation **SA1**.

7.2.8 Where alternative requirements of the Navy or Naval Authority relating to the breaking load of the towing hawser required by Pt 3, Ch 5, 7.6.1 have been complied with, the ship will be entitled to the notation **TA(NS)**. These alternative requirements are to be clearly defined and referenced in the Certificate of Class. The load specified in the alternative is to replace the BL value given by the expression in 7.6.1.

7.2.9 Where the towline complies with the strength requirements of Table 5.7.1 as applicable to merchant ships for the related equipment number, the ship will be entitled to the assignment of the **TA(S)** notation. The breaking load specified in Table 5.7.1 is to replace the BL value given by the expression in 7.6.1.

7.2.10 Towing operations are to be in accordance with the towing, mooring and arrangements plan or equivalent information which is required to be placed on board. See 7.4.

7.3 Materials

7.3.1 Towing hawsers and towing pennants can be of steel wire rope, natural fibre or synthetic fibre. The diameter, construction and specification of steel wire or fibre towlines are to comply with Chapter 10 of the Rules for Materials. Where synthetic fibre ropes are used the size and construction will be specially considered

7.3.2 Where a length of chafing chain is included in the arrangement it is to comply with Chapter 10 of the Rules for Materials.

7.3.3 The design loads applied to deck fittings by this Section relate to conventional fibre ropes (i.e. polypropylene, polyester and nylon). Consideration should be given to the elongation properties of the actual line used.

7.3.4 Wire ropes used in association with winches (on which the rope is stored on the winch drum) are to be of suitable construction.

7.4 Information required

7.4.1 Plans are to be of sufficient detail for plan approval purposes. Plans covering the following items are to be submitted for approval:

- Strong points, bollards and fairleads, see 7.5.7.
- Support structure and foundations of towing equipment.

7.4.2 The towing arrangement plan is to be submitted for information. It is to include the following in respect of each shipboard fitting:

- Location on the ship.
- Fitting type.
- Safe working load (SWL).
- Manner of applying towing line load, including limiting fleet angles.

The towing arrangement plan is to be provided onboard the ship for the guidance of the Master.

10+	48+	0,0150	8

7.5 Towing arrangements

7.5.1 A towing arrangement is to be provided at both the fore and aft end of the ship.

7.5.2 The fixed towing equipment is to comprise a securing arrangement which is a strong point and may be in the form of a stopper, bracket, deck clench or towing slip. A fairlead, rollers or other appropriate towline guides as necessary are to be included in the arrangement.

7.5.3 Loose towing equipment is to comprise a towing hawser and a towing pennant. The towing pennant may comprise a length of chafing chain. In the absence of a length of chafing chain suitable arrangements (e.g. a low friction sheath are to be provided).

7.5.4 Fairleads and guides are to be designed so as to prevent excessive bending stress in the towing hawser, towing pennant or chafing chain, whichever is applicable. The bending ratio of the guides bearing surface to the diameter of the applicable towline element is not to be less than 7 to 1. For fibre rope towing hawsers and towing pennants the bending ratio is to comply with the rope manufacturer's specification.

7.5.5 The fairlead or guide is to have an opening large enough to allow the passage of the largest element of the loose towing equipment.

7.5.6 The fairlead or guide is to be fitted as close to the deck as practicable and in a position so that the tow will be approximately parallel to the deck when under tension between the strong point and the guide.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

Section 7

7.5.7 The selection of shipboard fittings is to be made by the shipyard in accordance with an acceptable National or International standard. If the shipboard fitting is not selected from an acceptable National or International standard then the design load used to assess its strength and its attachment to the ship is to be in accordance with the design load given in 7.6.3. The design is to be submitted for approval. Any weld, bolt or equivalent device connecting the shipboard fitting to the supporting structure is part of the shipboard fitting and is subject to the National or International standard applicable to that shipboard fitting.

7.5.8 Deck fittings and strong points are to be located on longitudinals, beams and/or girders, which are part of the deck construction so as to facilitate efficient distribution of the towing load. Other equivalent arrangements will be considered, providing the strength is confirmed as adequate for the intended use.

7.5.9 To avoid chafing, the arrangement is to be designed so that no element of the loose towing equipment, when under tension is to contact with the ships hull at any point other than those specified as a securing arrangement, fairlead or guide. The final point of contact of the towline with the ship is to be positioned as close as practicable to the centre line so as to reduce the adverse effect on manoeuvrability.

7.5.10 The chafing arrangement is to extend a minimum of 3 m outboard of the fairlead or guide when in the deployed position and 2 m inboard.

7.5.11 The loose towing equipment is to be located as near as practicable to the strong point and is to be designed to be capable of being rigged and deployed in the absence of power. It is recommended that extra loose gear meeting the requirements of this Section be carried on board to provide for redundancy.

7.5.12 The minimum length of the towing hawser is to be as given in Table 5.7.1.

7.5.13 Irrespective of strength requirements, no fibre rope is to be less than 20 mm in diameter.

7.5.14 The SWL of each shipboard fitting is to be clearly marked, by weld bead or equivalent, on each of the fittings used for towing, see 7.6.10.

7.6 Strength requirements for towing arrangements

7.6.1 The minimum Breaking Load (hereinafter referred to as *BL*) of the towing hawser, in tonnes, is not to be less than that calculated below:

$$BL = (0,03\Delta^{2/3} + (C_{mw}A_t))K$$

where

Δ = displacement, in tonnes, to the deep draught waterline

C_{mw} = wind speed coefficient, which is to be taken from Table 5.7.2 for the relevant notation

K = weather factor, which is to be taken from Table 5.7.2 for the relevant notation

A_t = transverse projected area, in m^2 , of the hull and of all superstructures, houses, masts, etc., above the design draught.

7.6.2 The strength of other loose towing equipment e.g. links, shackles rings and chafing chain is to be determined on the basis of a design load equal to 1,25 times the *BL* of the towing hawser. If a greater design load is specified by the Naval Authority this load is to be used.

7.6.3 The strength of shipboard fittings and their supporting structure is to be determined on the basis of a design load equal to 1,25 times the *BL* of the towing hawser. If a greater design load is specified by the Naval Authority this load is to be used. The design load is to be applied through the towline according to the arrangement shown on the towing arrangement plan. The point of action of the force on the fitting is to be taken as the point of attachment of the mooring line or towline or at a change in its direction. The total design load applied to a fitting need not be more than twice the design load, see Fig. 5.7.1.

7.6.4 The stress in all loose and fixed towing equipment constructed of steel, and its supporting structure, is not to exceed the specified minimum yield stress of the material in bending and 60 per cent of the specified minimum yield stress of the material in shear. Special consideration will be given if the vessel and/or towing equipment is not constructed of steel.

7.6.5 The reinforced members (carling) beneath shipboard fittings are to be effectively arranged for any variation of direction (horizontally and vertically) of the towing forces (which is to be not less than the design load) acting through the arrangement of connection to the shipboard fittings. Other arrangements will be specially considered provided that the strength is confirmed as adequate for the service.

7.6.6 For the assessment of fairleads and their supporting structure, due consideration is to be given to lateral loads. The strength of the fairlead is to be sufficient for all angles of towing load up to 90° horizontally from the ship's centreline and 30° vertically from the horizontal plane.

7.6.7 For the assessment of a strong point and its supporting structure, the applied load is to be in the direction that the towing pennant or towing hawser will take up during normal deployment. It is also to be applied at the maximum height possible above the deck for that specific type of strong point.

7.6.8 The structural arrangements of strong points, bollards and fairleads are to be such that continuity will be ensured. Abrupt changes in section; sharp corners and other points of stress concentration are to be avoided.

7.6.9 Strong points are to be fitted in way of a transverse or longitudinal deck girder or beam to facilitate efficient distribution of the towing load.

7.6.10 The SWL of each towing arrangement component is to be no greater than 80 per cent of the design load applied.

Fig. 5.7.1 Design load applied to fittings

Section 8

Windlass and capstan design and testing

8.1 General

8.1.1 A windlass, capstan or winch of sufficient power and suitable for the size of anchor cable is to be fitted to the ship. Where Owners require equipment significantly in excess of Rule requirements, it is their responsibility to specify increased windlass power.

8.1.2 The windlass seating to be designed to loads no less than the maximum pull developed by the windlass.

8.1.3 Windlasses may be hand or power operated, subject to the requirements of 8.2.3.

8.1.4 Where steel wire rope is used in lieu of chain cable, a suitable winch with sufficient drum capacity to store the length of wire rope fitted is to be provided.

8.1.5 The windlass, anchoring capstans and winches are to be of types approved by LR.

8.1.6 On ships equipped with anchors having a mass of over 50 kg, windlass(es) of sufficient power and suitable for the type and size of chain cable are to be fitted. Arrangements with anchor davits will be specially considered.

8.1.7 The design of the windlass is to be such that the following requirements or equivalent arrangements will minimise the probability of the chain locker or forecabin being flooded in bad weather:

- a weathertight connection can be made between the windlass bedplate, or its equivalent, and the upper end of the chain pipe, and
- access to the chain pipe is adequate to permit the fitting of a cover or seal, of sufficient strength and proper design, over the chain pipe while the ship is at sea.

8.2 Performance

8.2.1 The following performance criteria are to be used as a design basis for the windlass:

- The windlass is to have sufficient power to exert a continuous duty pull over a period of 30 minutes of:

- For specified design anchorage depths up to 82,5 m:

Cable grade	Duty pull, P , in N
U1	$36,79d_c^2$
U2	$41,68d_c^2$
U3	$46,60d_c^2$

- For specified design anchorage depths greater than 82,5m:

$$P_1 = P + (D_a - 82,5) 0,214d_c^2 \text{ N}$$

where d_c is the chain diameter, in mm, D_a is the design anchorage depth, in metres, P is the duty pull for anchorage depth up to 82,5 m and P_1 is the duty pull for the anchorage depths greater than 82,5 m.

- The windlass is to have sufficient power to exert, over a period of at least two minutes, a pull equal to the greater of:

- short term pull:
1,5 times the continuous duty pull as defined in 8.2.1(a).

- anchor breakout pull:

$$12,18W_a + \frac{7,0L_c d_c^2}{100} \text{ N}$$

where

L_c is the total length of chain cable on board, in metres, as given by Table 5.4.1

W_a is the mass of bower anchor (kg) as given in Table 5.4.1.

- In the absence of a chain stopper, the windlass, with its braking system in action and in conditions simulating those likely to occur in service, is to be able to withstand, without permanent deformation or brake slip, a load, applied to the cable, given by:

$$K_b d_c^2 (44 - 0,08d_c) \text{ N}$$

where

K_b is given in Table 5.8.1

The performance criteria are to be verified by means of shop tests in the case of windlasses manufactured on an individual basis. Windlasses manufactured under LR's Type Approval Scheme for Marine Engineering Equipment will not require shop testing on an individual basis.

- Where a chain stopper is fitted, the windlass braking system is to have sufficient brake capacity to ensure safe stopping when paying out the anchor and chain. It is the Master's responsibility to ensure that the chain stopper is in use when riding at anchor. At clearly visible locations on the bridge and adjacent to the windlass control position the following notice is to be displayed:

'The brake is rated to permit controlled descent of the anchor and chain only.

The chain stopper is to be used at all times whilst riding at anchor.'

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

Sections 8 & 9

Table 5.8.1 Values of K_b

Cable grade	K_b	
	Windlass used in conjunction with chain stopper	Chain stopper not fitted
U1	4,41	7,85
U2	6,18	11,00
U3	8,83	15,7

8.2.2 Windlass performance characteristics specified in 8.2.1 and 8.3.2 are based on the following assumptions:

- One cable lifter only is connected to the drive shaft.
- Continuous duty and short term pulls are measured at the cable lifter.
- Brake tests are carried out with the brakes fully applied and the cable lifter declutched.
- The probability of declutching a cable lifter from the motor with its brake in the off position is minimised.
- Hawse pipe efficiency assumed to be 70 per cent.

8.2.3 Hand-operated winches are only acceptable if the effort required at the handle does not exceed 150 N for raising one anchor at a speed of not less than 2 m/min and making about thirty turns of the handle per minute.

8.2.4 Winches suitable for operation by hand as well as by external power are to be so constructed that the power drive cannot activate the hand drive.

8.3 Tests and trials

8.3.1 Where shop testing is not possible and Type Approval has not been obtained, calculations demonstrating compliance with 8.2.1 are to be submitted together with detailed plans and an arrangement plan showing the following components:

- Shafting.
- Gearing.
- Brakes.
- Clutches.

8.3.2 During trials on board the ship the windlass is to be shown to be capable of:

- for all specified design anchorage depths: raising the anchor from a depth of 82,5 m to a depth of 27,5 m at a mean speed of 9 m/min.
- for specified design anchorage depths greater than 82,5 m, in addition to (a): raising the anchor from the specified design anchorage depth to a depth of 82,5 m at a mean speed of 3 m/min.

Following trials, the ship will be eligible to be assigned a descriptive note 'Specified design anchorage depth. . . metres' which will be entered in column 6 of the *Register Book*.

8.4 Seatings

8.4.1 The windlass is to be efficiently bedded and secured to the deck. The thickness of the deck in way of the windlass is to be increased, and adequate stiffening is to be provided, to the Surveyor's satisfaction. The structural design integrity of the bedplate is the responsibility of the Builder and windlass manufacturer.

Section 9 Structural details

9.1 General

9.1.1 An easy lead of the cables from the windlass to the anchors and chain lockers is to be arranged. Where cables pass over or through stoppers, these stoppers are to be manufactured from ductile material and be designed to minimise the probability of damage to, or snagging of, the cable. They are to be capable of withstanding without permanent deformation a load equal to 80 per cent of the Rule breaking load of the cable passing over them.

9.2 Bulbous bow and wave piercing bow arrangements

9.2.1 The shell plating is to be increased in thickness at the fore end of the bulb and in other areas likely to be damaged by the anchors and chain cables. The increased plate thickness is to be the same as that required for plated stems by Part 6.

9.3 Hawse pipes and anchor recesses

9.3.1 Hawse pipes, bow rollers and other deck gear, of adequate size and construction, are to be provided for handling and securing the anchors and are to be efficiently attached to the structure and arranged to give an easy lead to the cable.

9.3.2 The hawse pipes are to be of sufficient size and thickness with a minimum diameter not less than 12 times the diameter of the chain cable. The arrangement is to give an easy lead for the cable to the windlass.

9.3.3 Hawse pipes and anchor pockets are to be of ample thickness and of a suitable size and form to house the anchors efficiently, preventing, as much as practicable, slackening of the cable or movements of the anchor being caused by wave action. The shell plating and framing in way of the hawse pipes are to be reinforced as necessary, see 9.5.1. Substantial chafing lips are to be provided at shell and deck. These are to have sufficiently large, radiused faces to minimise the probability of cable links being subjected to high bending stresses. Alternatively, roller fairleads of suitable design may be fitted. Where unpocketed rollers are used, it is recommended that the roller diameter be not less than eleven times the chain diameter. Where hawse pipes are not fitted, alternative arrangements will be specially considered.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

Sections 9 & 10

9.3.4 The lines of the bow are to be taken into consideration when siting the anchor recesses for conventional bower anchors. Sufficient clearance of the flukes from the hull is to be maintained over the whole of the anchor run, above and below the water, considering the flukes in the most critical position. If a bow sonar dome is fitted consideration is to be given to the positioning of the anchor recesses to reduce the possibility of the anchor chain rubbing on the dome when the anchor is in the deployed position.

9.4 Spurling pipes

9.4.1 Satisfactory means are to be provided to prevent inadvertent flooding of chain lockers.

9.5 Local reinforcement

9.5.1 The thickness of shell plating determined in accordance with the Rule requirements is to be increased locally by not less than 50 per cent in way of hawse pipes.

Section 10 Launch and recovery, berthing and docking arrangements

10.1 Berthing loads

10.1.1 To resist loads imposed by tugs and berthing operations all structure within a 1,0 m strip centred 1,0 m above the deep waterline. It should be able to withstand the following pressure P_b :

$$P_b = \left(\frac{g\Delta}{800} \right) \text{ kN/m}$$

where

Δ = deep displacement, in tonnes.

10.1.2 If $L_R > 200$ m, or the ship is able to have significantly different loading conditions, the strip is to be taken from 1,5 m above the light waterline to 2,5 m above the deep waterline.

10.1.3 Ships with markings to indicate location of internal structure designed specifically for berthing purposes will be specially considered.

10.2 Docking loads

10.2.1 Docking a ship on blocks potentially imposes high vertical loads on the keel. For ships where the Rule length, L_R , exceeds 50 m the strength of the keel and double bottom structure is to be assessed. Methods, other than the simplified method or direct calculation method described here, for demonstrating that the strength of the structure is ensured against the loads imposed by docking may be considered and are to be agreed with LR.

10.2.2 It is recommended that for ships of fine hull form or where W_{oh} , as defined in 10.2.6, at any block becomes negative the docking load distribution is derived by direct calculation using a full ship finite element model constructed generally in accordance with the ShipRight SDA procedure for passenger ships. The model is to be supported on grounded spring elements representing the dock block arrangement as given in the docking plan. Calculations should be carried out for a representative number of docking conditions. The spring element stiffness in the model should be representative of the block and capping stiffness. An assessment of the result should be carried out to ascertain the sensitivity of the structural response to the spring constant used. Under the application of the loads the acceptance criteria given in Table 5.10.1 are not to be exceeded. The appropriate buckling criteria of Pt 6, Ch 2,3 are to be applied using the minimum buckling factor given in Table 5.10.1.

10.2.3 For full bodied ships or where a more detailed assessment is impractical a simplified method may be used where a line load at the keel equal to the following equation is distributed equally over blocks in that section. For block spacing where a number of blocks are spaced equally between the transverse bulkheads, the load on the keel can be taken as a distributed line load.

$$F_{DL} = \frac{g W_c f_{bhd}}{L_c} \text{ kN/m}$$

where

W_c = weight of the length between main transverse bulkheads in tonnes

f_{bhd} = correction factor to be applied within 1 frame of transverse bulkheads

= 2, within one frame of transverse bulkheads

= 1, elsewhere

g = acceleration due to gravity, 9,81 m/s²

L_c = distance between main transverse bulkheads, in metres.

10.2.4 For ships with an after cut-up or a significant rake of stem where there is a considerable overhang increasing the load at the after or fore end of the keel. It may be assumed that the increase in load due to the overhang will extend forward from the cut up a distance equal to twice the length of the overhang and will be distributed parabolically, see Fig. 5.10.1.

10.2.5 When an overlap of the forward and aft overhang correction curves occurs both curves are to be included in the total line load over a section. This will increase the possibility that blocks amidships will become unloaded, see 10.2.2.

10.2.6 It may then be shown that the mass per unit length to be added at each dock block at forward of the cut-up is given by the following equation:

$$W_{oh} = \frac{3g W_o k_{dl}}{4L_o^2} \text{ kN/m}$$

where

$$k_{dl} = (2L_o + 3L_G) \left(\frac{x}{L_o} \right)^2 - 2(3L_o + 4L_G) \left(\frac{x}{L_o} \right) + 4(L_o + L_G)$$

x = distance forward of after cut-up, in metres

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

Section 10

Table 5.10.1 Acceptance criteria

Structural item	Allowable stresses, see Note		Minimum buckling factor
	σ_e	τ	λ
Double bottom girders	$0,75\sigma_L$	$0,35\sigma_o$	1,2
Double bottom floors	$0,75\sigma_L$	$0,35\sigma_o$	1,1
Symbols			
σ_o = specified minimum yield stress of material. so for steels having a yield stress above 355 N/mm ² will be specially considered $\sigma_L = \frac{235}{k_L}$ N/mm ² λ = factor against elastic buckling σ_e = Von Mises equivalent stress = $\sqrt{\sigma_x^2 + \sigma_y^2 - \sigma_y \sigma_x + 3\tau_{xy}^2}$			
NOTE In areas where the openings have not been modelled, the resulting shear stress and Von Mises stress is to be corrected according to the ratio of the actual to the modelled shear area. If the resulting stress levels exceed 90% of the specified allowable values, further study by means of fine mesh follow up models may be required. Von Mises stresses are to be recalculated on the basis of the corrected shear stresses.			

10.3 Launching loads

10.3.1 The launching loads are to be checked by the shipbuilder using conventional analytical methods appropriate to the method of launch. If via a slipway, the structure in way of the fore poppet should be suitable for the high loads that will be transmitted in this area. If adequate structure is not available, temporary stiffening is to be arranged.

10.3.2 The global strength of the hull girder is to be adequate under the loads imposed by launching, in particular for NS1 ships.

- W_o = weight of overhang, in tonnes
 W_c = weight of section between main transverse bulkheads, in tonnes
 L_o = length of overhang, in metres
 L_c = length between main transverse bulkheads
 L_G = position of centre of gravity aft of after cut-up.

10.2.7 Unusual docking procedures or arrangements will be specially considered.

Structural Procedures for the Design, Construction and Lifetime Care of Ships

Volume 1, Part 3, Chapter 6

Sections 1 to 5

Section

- 1 **General**
- 2 **Structural Design Assessment**
- 3 **Fatigue Design Assessment**
- 4 **Construction Monitoring**
- 5 **Ship Event Analysis**
- 6 **Enhanced Scantlings**
- 7 **Protective Coating in Water Ballast Tanks**
- 8 **Hull Condition Monitoring**
- 9 **Ship Emergency Response Service**

■ Section 1 General

1.1 Application

1.1.1 This Chapter is applicable to all ship types and components and the requirements are to be applied in conjunction with the relevant Chapters of Part 6.

1.2 Classification notations

1.2.1 In addition to the hull class notations defined in Pt 1, Ch 2, ships complying with the requirements of this Chapter will be eligible to be assigned the additional optional class notations defined in Pt 1, Ch 2.

1.3 Information and plans required to be submitted

1.3.1 The information and plans required to be submitted are as specified in the Pt 6, Ch 1,2.2, applicable to the particular ship type and in this Chapter where related to particular items and notations.

■ Section 2 Structural Design Assessment

2.1 Structural Design Assessment notation – SDA

2.1.1 Where scantlings are primarily examined using finite element methods for both the overall and detailed structural capability of the ship using Lloyd's Register (hereinafter referred to as 'LR') approved procedures, the notation **SDA** (Structural Design Assessment) may be assigned and will be entered in the *Register Book*.

■ Section 3 Fatigue Design Assessment

3.1 Fatigue Design Assessment notation – FDA

3.1.1 Where the fatigue capability of the ship has been assessed using LR approved procedures, the notation **FDA** (Fatigue Design Assessment) may be assigned and will be entered in the *Register Book*.

■ Section 4 Construction Monitoring

4.1 Construction Monitoring notation – CM

4.1.1 **CM** (Construction Monitoring) notation may be assigned to a ship and will be entered in the *Register Book* if extended controls on structural alignment, fit-up and workmanship standards are applied to critical areas identified by structural design assessment, specified in 2.1.1, and fatigue design assessment specified in 3.1.1, in accordance with LR approved procedures.

■ Section 5 Ship Event Analysis

5.1 Ship Event Analysis – Class notations **SEA(HSS-n), SEA(VDR), SEA(VDR-n)**

5.1.1 At the Owner's request, and in order to enhance safety and awareness onboard during ship operation, provisions can be made for the following systems:

- (a) A hull surveillance system that monitors the hull girder stresses and motions of the ship and warns the ship's personnel that these levels or the frequency and magnitude of slamming motions are approaching a level where corrective action is advisable.
- (b) A voyage data recorder system that can record the ship's control, navigational, operational and hull response information. This information is recorded and stored in a protective containment unit to enable the analysis of any marine or other incidents.

5.1.2 Where a hull surveillance system is fitted the class notation **SEA(HSS-n)** will be assigned. Where a voyage data recorder system is fitted the class notation **SEA(VDR)** or **SEA(VDR-n)** will be assigned. The extension **-n** signifies the number of fitted strain gauges connected to the system. The appropriate class notation(s) will be entered in column 6 of the *Register Book*, see also Pt 1, Ch 2,3.9.5 of the Rules for Ships.

Structural Procedures for the Design, Construction and Lifetime Care of Ships

Volume 1, Part 3, Chapter 6

Sections 6 to 9

■ Section 6 Enhanced Scantlings

6.1 Enhanced Scantlings – ES

6.1.1 Where scantlings in excess of the approved Rule requirement are fitted at defined locations as a corrosion margin or for other purposes as specified by the Owner, a notation, **ES**, 'Enhanced Scantlings', will be assigned. It will be accompanied by a list giving items to which the enhancement has been applied and the increase in scantling. For example, the item 'bottom shell (strakes A, B, C, D) + 2' will indicate that an extra 2 mm has been fitted to the bottom shell of the ship for the particular strakes listed, *see also* Pt 6, Ch 6.2.10. In addition, the plans submitted for approval are to contain the enhanced scantling, together with the nominal thickness less the enhancement, adjacent and in brackets.

■ Section 7 Protective Coating in Water Ballast Tanks

7.1 Protective Coating in Water Ballast Tanks – PCWBT

7.1.1 It is recommended for all ship types that all salt water spaces having boundaries formed by the hull envelope are to have a corrosion protection coating applied.

7.1.2 If the Owner so wishes, a notation **PCWBT** 'Protective Coating in Water Ballast Tanks', will be entered in the *Register Book* to indicate that the ship's water ballast tanks are coated and that the coating remains efficient and well maintained. If the coatings have broken down, particularly at more critical areas, and no effort is being made to maintain the coatings, then this notation will be placed in parentheses, i.e. (**PCWBT**). In either case the date of the last survey will be placed in parentheses after the notation.

■ Section 8 Hull Condition Monitoring

8.1 Hull Condition Monitoring – HCM

8.1.1 Where an Owner adopts the LR Hull Condition Monitoring Scheme the notation **HCM**, 'Hull Condition Monitoring' will be entered in the *Register Book*.

8.1.2 This notation will indicate that a computer software system for on-board recording of ship surveys is available aboard ship.

■ Section 9 Ship Emergency Response Service

9.1 Ship Emergency Response Service – SERS

9.1.1 This service, offered by LR, provides a rapid computer assisted analysis of a damaged ship's stability and damaged longitudinal strength in the event of a casualty to the ship.

9.1.2 Where an Owner adopts this service, the notation **SERS**, 'Ship is registered with LR's Ship Emergency Response Service', will be entered in the *Register Book*.

■ Section 1 General requirements

1.1 General

1.1.1 This Section is aimed primarily at assessing structure such that it can resist the military loads imposed upon it, however it is essential in naval ship design to consider the effects an item of equipment or structure can have on a variety of parameters. For example a winch support and mount may adequately resist the forces imposed upon it during normal operation and absorb shock loads but have an unacceptably high noise or radar signature.

1.1.2 Chapter 1 gives guidance on some of the additional issues that the designer must consider in the design of a naval ship. Whilst it does not always give the definitive answer on these topics, it will help identify the impact of structural design on the subject. An example is radar signature reduction. The guidance gives the geometric properties to avoid but it will not give detail on radar absorbent coatings.

1.1.3 Information is classified in two types. Firstly, design guidance for which further approval has to be sought once a suitable standard is identified by the Naval Authority, and secondly, design requirements which have to be met as part of the **✕100A1** notation or a specific notation such as **LA(N)**.

1.2 Plans

1.2.1 Plans are to be submitted showing the manner in which the requirements have been met and the location of the structure within the vessel for those features that have either a special notation or are required as part of the notation **✕100A1** or ship type.

1.2.2 Details on the loadings applied to individual items, and by these items to the support structure are to be included. In some cases stiffness requirements will also need to be included, e.g. mast mounted equipment.

1.2.3 Plans, and where requested, calculations should be submitted for the following features as appropriate:

- Replenishment at sea arrangements.
- Aircraft and vehicle tie down arrangements.
- Movable decks, ramps and lifts.
- Masts and support arrangements.
- Towed array or towed body arrangement.
- Weapon recoil and thrust loadings.

1.2.4 Arrangements for the following features are to be included with the hull structural plans listed in Pt 6, Ch 2.2. In addition calculations are to be supplied where requested:

- Vehicle decks.
- Helicopter decks.
- Berthing.
- Docking loads.
- Beach landing or grounding.
- Holding down arrangements.

1.2.5 Plans and supporting calculations should be submitted for the following notations:

- External blast (**EB1, EB2, EB3, EB4**).
- Internal blast (**IB1, IB2**).
- Fragmentation (**FP1, FP2**).
- Small arms protection (**SP**).
- Under water explosion (Shock) (**SH**).
- Whipping (**WH1, WH2, WH3**).
- Residual strength (**RSA1, RSA2, RSA3**).

1.3 Signature

1.3.1 A naval vessel will generally require some form of signature control and the operational requirement will determine the extent to which this is necessary. Signature control can be achieved using a variety of methods both active and passive. This Section deals with the passive methods that structure can influence.

1.3.2 With good structural design the signature of the vessel can be controlled to a certain degree with little cost. The methods listed in Table 1.1.1 can help achieve this.

1.3.3 It is beyond the scope of the Rules to provide further detail on signatures, however on request, Lloyd's Register (hereinafter referred to as 'LR') is able to provide information on suitable organisations who are able to give specialist advice as necessary.

1.3.4 Special features notations for signature control will not normally be assigned. Some of the above features will form part of the Naval Ship notation **✕100A1 NS** and are detailed in Section 3. If requested by the Owner a descriptive note can also be assigned.

Table 1.1.1 Ship signatures

Signature	Simple methods of control using hull construction
Above water Visual Infrared Radar cross-section Unintentional electro-magnetic emissions	Camouflage paint Careful positioning of exhaust outlets Structural shaping Use of steel plating (Faraday cage)
Under water Self noise Radiated noise Magnetic field Electric field Wake	Fairness of hull, low vibration Low vibration Non-ferrous materials Degaussing Attention to earth paths Hull form, propeller design

1.4 Materials and welding

1.4.1 In addition to the requirements of Pt 6 Ch 2, ships having the following military distinction notations are to comply with the requirements of this Section for the designated areas unless specified otherwise. The requirements apply to plates, stiffeners, fillet welds, butt welds and welded attachments:

- **EB1, EB2, EB3, EB4** Above water portion of the hull, superstructure and upper decks assessed against external blast requirements.
- **IB1, IB2** Blast bulkheads.
- **SH1, SH2** Hull envelope plating.
- **WH1, WH2, WH3** Sheerstrake, stringer plate (including margin angle), bilge strake, keel plate, garboard strake and hull inserts.
- **RSA1, RSA2, RSA3** Sheerstrake, stringer plate (including margin angle), bilge strake, keel plate, garboard strake and hull inserts.

1.4.2 Crack arresting strakes of minimum Grade E are to be fitted in the following locations, from $0,2L_R$ to $0,8L_R$, according to the notation assigned:

- **SH1, SH2** Sheerstrake, stringer plate (including margin angle), bilge strake, keel plate, garboard strake and hull inserts in these areas.
- **WH1, WH2, WH3** Sheerstrake, stringer plate (including margin angle), bilge strake, keel plate, garboard strake and hull inserts in these areas.
- **RSA1, RSA2, RSA3** Sheerstrake, stringer plate (including margin angle), bilge strake, keel plate, garboard strake and hull inserts in these areas.

Where the hull envelope is made entirely from Grade D steel, crack arresting strakes of minimum Grade E need not be fitted in the specified locations.

1.4.3 Generally for joints between steels of different strength levels the welding consumable may be of a type suitable for the lesser strength.

1.4.4 For joints between steels of different toughness levels, the welding consumable is to be of a type suitable for the higher grade being connected.

1.4.5 The consumable used is to comply with the requirements of Table 1.1.2. Other grades of steel will be specially considered, but in general, the toughness in the upward vertical direction is not to be significantly less than that of the parent plate, measured in the direction of rolling.

Table 1.1.2 Welding consumable grade

Steel grade	Normal electrode grade	Military requirement grade
A	1	1
AH32	1Y	2Y
AH36	1Y	2Y
AH40	2Y40	2Y40
B	2	2
D	2	3
DH32	2Y	3Y
DH36	2Y	3Y
DH40	3Y40	3Y40
E	3	4
EH32	3Y	4Y
EH36	3Y	4Y
EH40	4Y40	4Y40

Section 2 Survivability

2.1 General

2.1.1 Survivability is defined as the probability that a ship can remain operational to some degree following an attack. The elements of whole ship survivability are shown in Fig. 1.2.1. Survivability is divided into two main aspects:

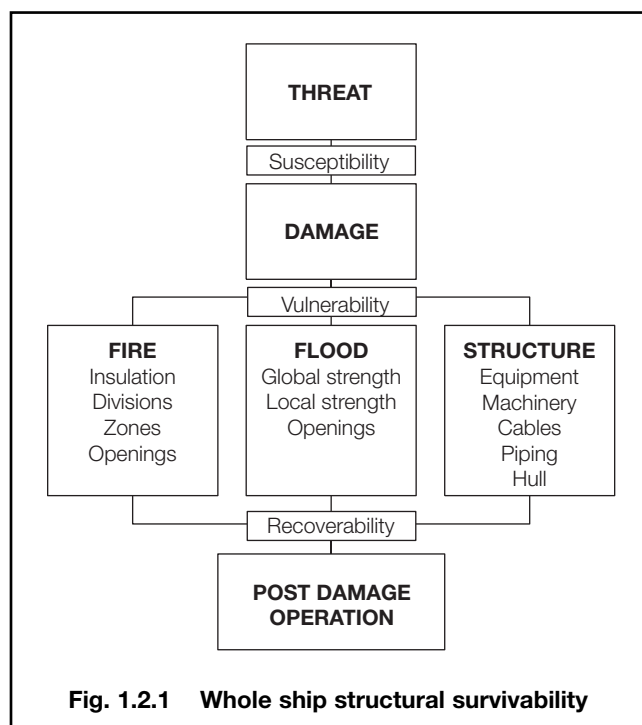

- Susceptibility, the probability of a threat acquiring, reaching and detonating on a ship.
- Vulnerability, the probability that a ship will be able to survive a successful attack and operate at a certain level.

Survivability is normally calculated as the product of susceptibility and vulnerability. Recoverability is an important aspect as it has a significant influence on the vulnerability of the overall ship as a system. It can be defined as a measure of the ability of the ship to reach a particular level of operation higher than that immediately following the hit. A variety of levels of operation required following damage can be defined, see 2.2.

2.1.2 Generally there are four basic phases in the classification of naval ships with respect to survivability:

- Concept phase.
- Assessment phase.
- Build phase.
- Maintenance phase.

2.1.3 The **concept phase** is not normally part of classification and is a discussion between the Owner, Naval Authority, designer and those specialists able to perform the appropriate calculations. It is used to identify the potential threats, requirements for the ship structure, machinery and systems with respect to those threats.

2.1.4 The **concept phase** will apply all of the elements shown in Fig. 1.2.1:

- Identification of the threat is first and this is usually determined by the Naval Authority for current and future threats. Several threats will be identified which affect the ship in a variety of ways, they may be under water or above water, far field, close in, or contact weapons. Typical threat groups are given in Table 1.3.1.
- The susceptibility is the ability of the threat to reach the ship and detonate and is a function of the capability of the threat, the ship's signatures and the ship's defence systems. Various computer codes and simulations are available for determining the susceptibility of a hull and the capability of weapon systems. Consideration should be given to the degradation of a threat by a ship's defence systems.
- If a threat detonates, damage may result. The extent and amount of damage is a function of the vulnerability of the ship, see 2.2. A vulnerability assessment may be used to determine the consequences of the threat detonation. The consequences are likely to be in the form of fire flood and physical damage as shown in Fig. 1.2.1. The assessment tools used in the design stage for vulnerability analysis generally employ simple design formulae which are then verified during the assessment phase.
- The consequences of damage can be limited through recoverability, the ability to repair damage to structure, equipment and systems. This is mainly an operational matter though it will have an impact on ship design. Damage control operational procedures will make certain demands on structure and equipment.

2.1.5 It is beyond the scope of the Rules to provide further detail on the concept phase. However on request, LR is able to provide details of suitable organisations who are able to give specialist advice as necessary.

2.1.6 The **assessment phase** looks in more detail at the vulnerability of the ship and uses explicit calculations to assess the capability of the ship based upon the relevant effects of threats such as blast pressure or fragment size. It is not necessary to define the actual weapon, just the consequences or effects of threats. A threat can produce a variety of effects, the manner in which the Rules currently address these effects is detailed in Chapter 2. In naval ship classification, notations are used to denote that a calculation for a particular threat has been reviewed. Currently, these are concerned with structural aspects only, though some aspects of machinery are indirectly addressed through other notations such as propulsion machinery redundancy, **PMR**, steering gear machinery redundancy, **SMR** and fire safety, **FS**.

2.1.7 The **build phase** ensures that the requirements of the assessment phase are put in place onboard the ship. It is identical to the normal classification requirements for construction, installation and testing of structure and equipment under LR survey, verifying that the correct materials, welding fabrication and testing procedures are used.

2.1.8 The **maintenance phase** is applied by maintaining a ship in class through life. It verifies that the original standard to which the ship was built is maintained and that any new rule requirements are implemented. It also verifies that modifications to the ship do not compromise the integrity of the structure, equipment or systems.

2.1.9 It is the responsibility of the Naval Authority to ensure that each of the phases is implemented, to define the requirements that are to be met and advise the Owner on the manner in which particular threats can be dealt with.

2.2 Vulnerability

2.2.1 The resistance of a vessel to loadings from military threats can be described by the term vulnerability which is the probability that once hit by a specified threat a vessel will lose capability.

2.2.2 This Chapter deals separately with the effects of a threat on the structure but when considering the total vulnerability of the ship it will be necessary to combine all the effects of a weapon detonation to determine the total damage to the ship as a system. This is normally done very early in the design stage at a low level of complexity, see 2.1.4. Several computer codes are available to determine the consequence of weapon threats on the ship system.

2.2.3 The damage to a ship is likely to occur by three mechanisms; fire, flood and physical damage, see Fig. 1.2.1. The direct effect of threats on the ship's crew is not included in this Section but some features such as shelter stations and CBRN protection will reduce the risk. Indirect damage caused by the threat should also be considered and a vulnerability analysis can be used to site magazines such that they are offered the maximum protection.

2.2.4 The methods used to control the spread of fire will have an effect on structural design, materials, fire insulation, fire divisions and openings, and must all be considered. One method used to control the spread of fire is zones and some guidance on the philosophy and structural requirements is provided in Section 7. However the precise requirements for fire detection, protection and extinction are to be defined by the Naval Authority. Where this is examined by LR in accordance with Pt 1, Ch 2.3.9.9 a **FS** notation may be assigned. Other methods include the use of smoke tight boundaries, insulation and fire fighting systems.

2.2.5 The stability of a vessel and flooding following damage is not covered in this Chapter. The stability standard, nominated by the Naval Authority, will define the extent of damage that the vessel is required to survive and remain stable. All structure and watertight closing appliances will need to be assessed to this level. Pt 3, Ch 1.5 defines how the minimum extent of watertight subdivision is to be determined. Pt 3, Ch 4 contains details on requirements for closing appliances. For such an extreme event as flooding, plastic type analysis is appropriate for watertight structure and this is recognised in the relevant rule requirements.

2.2.6 For the hull, the effect of the threat can be limited in two ways:

- Ensuring that there is adequate global strength following damage using a residual strength analysis. Where appropriate a whipping analysis may also be necessary.
- Ensuring that local structure can contain the threat or limit the damage. Individual items of structure can be hardened or strengthened in certain areas to achieve this.

2.2.7 Physical damage may occur to cables, piping, equipment and machinery, and other systems. The duplication or protection of these items is dealt with in Vol 2, Pt 1, Ch 2.4.9. Where protection is required, e.g. armour, the impact on the structural design of the hull is to be considered.

2.2.8 Different levels of vulnerability can be represented, as illustrated in Fig. 1.2.2. Each will have different acceptance criteria for the hull structure. For an internally detonating threat, the increasing levels can be visualised as a threat of increasing magnitude rather than increasing distance.

2.2.9 Level A is that, closer than which, the hull structure will fail due to the detonation of a threat. The failure can occur in a number of ways as detailed in Chapter 2. At this level the assessment will normally be performed using plastic criteria which will result in permanent deformation. The ship may no longer function effectively but it should remain afloat and not rupture or fail catastrophically.

2.2.10 Level B is that, closer than which, the majority of the ship's machinery and equipment is damaged such that it will not operate effectively and the ship can no longer continue to navigate. The hull must therefore not deform permanently and elastic assessment criteria may be necessary to determine the global strength of the hull (local deformation may be sustained).

Fig. 1.2.2
Vulnerability contours for a given threat level

2.2.11 Level C is that, closer than which, the ship's weapon systems begin to fail and the vessel is no longer able to operate with full effectiveness. Normally the global and local criteria would be assessed against elastic criteria.

2.2.12 Levels B and C for underwater threats are primarily dealt with by adopting a suitable shock policy for the ship.

2.2.13 It is the responsibility of the Owner to decide the levels at which these should be set. In theory, they could be made to be coincident but this would provide little reserve within the vessel for recovery by damage control and repair. Conversely, they should not be set too far apart as this represents unnecessary armament and strengthening which is not effectively protecting the equipment and machinery from attack.

2.2.14 For an assessment of a threat which also produces effects on machinery, two structural calculations may have to be performed. One at the equipment level of failure using failure criteria that result in little or no deformation (plating only for example) and one approaching a structural failure level using ultimate strength or plastic collapse criteria. The requirements in Chapter 2 generally deal with ultimate strength or plastic criteria, the conventional rule calculations in Pt 6, Ch 2 and Chapter 5 set elastic failure criteria. For normal naval ship construction, the hull is usually able to withstand the threat level at which equipment and systems fail with little or no permanent deformation, though some check calculations may be necessary on critical areas.

Section 3 Military distinction notations

3.1 General

3.1.1 By its very nature a naval ship will be required to face and resist a variety of threats and it will be necessary to incorporate particular features to address those threats.

3.1.2 Some of the features required are already incorporated in the notation **100A1 NS**. However, where the operational requirement demands, additional or specific levels of performance, special features notations such as those listed in Pt 1, Ch 2,4 may be assigned showing protection against the effects of a particular threat.

3.1.3 Unless specifically requested these notations will be assigned at an appropriate level which will remain confidential to the Owner. It is the responsibility of the Owner to determine the threat levels suitable for their requirements. The agreed threat levels will not appear in the *Register Book* or be published in any other form. Only the notation **MD** will be used to show that some military features have been incorporated and constructed in accordance with LR's *Rules and Regulations for the Classification of Naval Ships*.

3.1.4 A distinction is made between:

- levels of threat, describing the magnitude of the missile, torpedo, mine or bomb; and
- method of analysis which may be performed at differing levels of complexity.

3.1.5 In an effort to establish links between the different military loads, default levels of threat have been assigned. A distinction is made between levels of above water and under-water threats, as certain ships may be at greater risk from one or the other depending upon their operational requirements. They are summarised in Table 1.3.1.

3.1.6 In addition to the hull class notations defined in Pt 1, Ch 2, ships complying with the requirements of this Chapter will be eligible to be assigned the additional class notations defined in Pt 1, Ch 2,2.1 and Ch 2,2.3 or descriptive notes as defined in Pt 1, Ch 2,2.6.

3.2 Above water threats

3.2.1 As described in Table 1.3.1 the external blast notation is normally independent of the internal blast and fragmentation notations as the threats that produce a survivable blast effect usually have a reasonable stand off. Typically, significant blast loading will arise from externally detonating threats such as far field nuclear at large stand offs and fuel air explosions at moderate stand offs. For an externally detonating conventional weapon, the blast will normally be insignificant but there will usually be a fragmentation threat. The external blast notation may also be independent of the residual strength notation unless the plastic deformation from an external blast renders certain structure ineffective with respect to global strength, e.g. a superstructure which contributes to longitudinal strength.

Table 1.3.1 Relationship between notations

	Above water weapons								Under water weapons			
	Small arms	Shell or projectile		Missile		Bomb			Mine or charge		Torpedo	
	Contact	Contact	Proximity	Contact	Proximity	Contact	Proximity	Far field (2)	Contact	Proximity	Contact	Proximity
SP	R	O										
FP		R	R	R	R	R	R					
IB		R		R		R						
EB			R		R		R	R				
SH									R	O	R	O
WH										R		R
RSA		O	O	R	O	R	R	R	R		R	
Symbols												
R = Required threats to be considered in the absence of a specific requirement. O = Optional threats to be identified by the Naval Authority and dependent on the characteristic of the threat.												
NOTES 1. It remains the responsibility of the Owner to determine the appropriate military notation and the appropriate levels of threat and analysis. 2. For nuclear threats, consideration should be given to CBRN requirements for structure, see Section 7, filtration and ventilation. The ability of the structure to screen an electromagnetic pulse should also be considered.												

3.2.2 Usually, both internal blast and fragmentation will result from an internally detonating threat and are therefore linked, for example, a missile threat as shown in Table 1.3.1. For a particular threat it is recommended that both fragmentation and internal blast assessments will be made to the same level of threat for the structure adjacent to the point of detonation. Consideration should be given to the precise nature of the blast loading and fragmentation pattern of the threat.

3.2.3 If transverse bulkheads are used to limit the longitudinal spread of damage then the decks and side shell will probably be damaged such that a residual strength assessment is required to ensure that the global strength is not compromised. This should be to the same threat level as the internal blast threat. Longitudinal blast resistant bulkheads, box girders or service tunnels could be used to maintain the longitudinal effective material of the hull girder.

3.2.4 A residual strength assessment of the above water structure can be carried out for any threat level under any threat, independently of the other above water threat notations. This is because the ship may still retain function even though it has not been specifically armoured against the internal blast or fragmentation arising from such a threat. The residual strength notation is normally required for sea skimming missile threats that may remove significant areas of above water structure.

3.3 Under water threats

3.3.1 Shock enhancement should be aimed at providing ruggedness and to verify at a low level, equipment and system operation is maintained and at a higher level, equipment is retained and the hull does not rupture. Notation is currently confined to structure and concentrates on local damage that can be addressed by close attention to quality of construction and by adopting good constructional detail. Shock effects give rise to equipment and system damage. Shock is a different mechanism to whipping, therefore a whipping assessment will not generally be required to the same level of a shock assessment, though it may be necessary to check that the shock threat assessed will not have a significant whipping load. Residual strength assessments may be appropriate for shock threats depending on the extent of local damage.

3.3.2 Whipping is caused by proximity detonation of a charge that excites the main hull girder at a low-order (two node) natural frequency which may cause significant structural damage at a relatively low charge weight. Shock effects therefore may be relatively low order and it will not always be necessary to undertake a shock analysis. In addition a whipping analysis may not be necessary for threats which detonate on contact or for steel ships under 70 m in length. Due to the nature of whipping effects (usually the plastic collapse at a section of the hull), a residual strength calculation is not normally appropriate for a whipping threat because the damage from the direct shock is usually limited.

3.3.3 Residual strength assessments of under water threats are normally concerned with contact mines or torpedo impacts. These will remove a certain amount of hull structure the effect of which is to be assessed by the residual strength calculation. Shock or whipping threats will only require a residual strength notation where there are significant amounts of local deformation to the hull girder. Significant damage is defined as that which reduces the global strength below the design margins.

3.4 Analysis levels

3.4.1 In addition to levels of capability determined by the threat level specified, there are also different methods of assessment. The method of assessment will depend on three aspects:

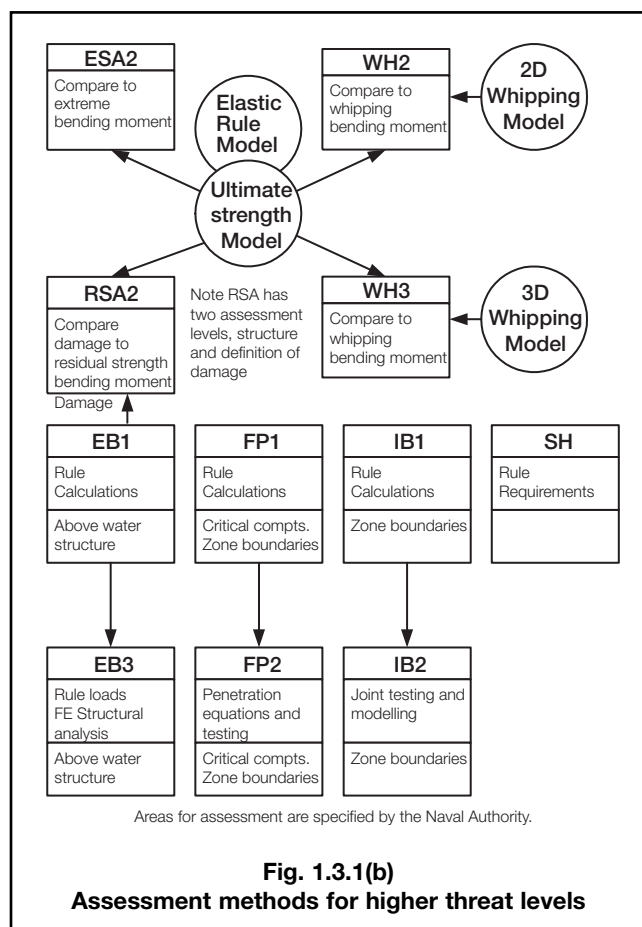

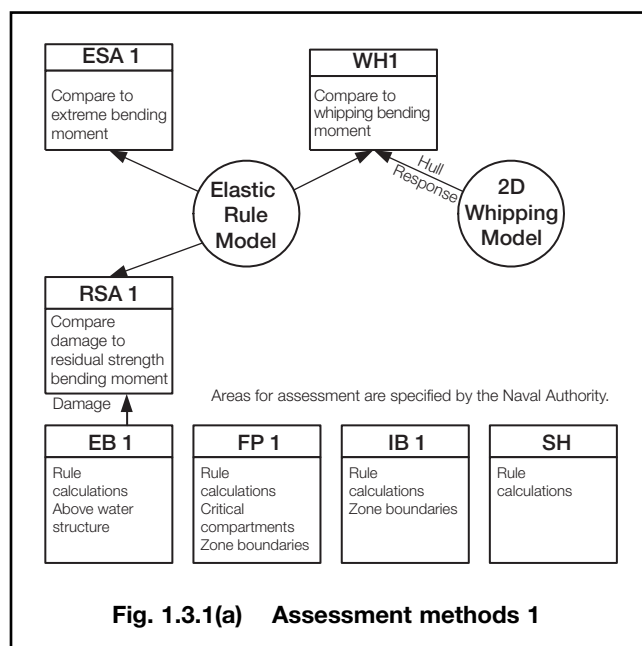

- The level of the threat. At higher levels of threat, the requirements of the rules may become uneconomical or impractical and a more in depth analysis is required.
- Applicability of the rule formulations. If the threat level is outside the range of applicability of the rule formulations further analysis will have to be undertaken.
- Acceptance criteria, dependent upon whether the threat is to be assessed against elastic or plastic collapse criteria.

3.4.2 Three methods of assessment are shown in Fig. 1.3.1. In general the same threat level can be specified in each case however, it is the responsibility of the Owner to specify the correct levels to meet their specific requirements.

- (a) The analysis of military loads can most simply be assessed using the elastic model created for rule analysis. This will result in an acceptable but conservative solution.
- (b) The next more complex method uses an elasto-plastic or ultimate strength model.
- (c) Finally more complicated processes such as 3D dynamic analysis can be used to determine the loading for the elasto-plastic model. Normally this will be carried out for local areas of interest.

3.4.3 Once an ultimate strength model has been created for the appropriate sections along the hull it may be utilised for a variety of military notation calculations, as shown in Fig. 1.3.1(b).

3.4.4 The damage required for the residual strength calculation can be defined in a variety of ways for a variety of threats, collisions or groundings. Non-military damage is defined in Pt 6, Ch 4,4 and military damage by the damage radii in Ch 2,7 or specifically from external blast and vulnerability calculations. The results from a vulnerability analysis can be used for input to a variety of military notations and, in general, formal vulnerability assessments will be required for higher threat levels, see 2.1.4.

Section 4 Military design guidance

4.1 Radar signature

4.1.1 All constructional details on the exposed surfaces of the hull and superstructures above the design waterline should be considered for their radar reflection properties.

4.1.2 Structure that presents three orthogonal internally reflecting surfaces to an incoming radar signal are to be avoided. Superstructure overhangs, sponsons and equipment mounts are particular problem areas.

4.1.3 Flare and tumble home as defined in Fig. 1.4.1 are to be used where possible on all vertical surfaces. The angle used should be greater than 6°.

4.1.4 The use of lattice type masts and equipment supports should be avoided.

4.1.5 The use of conical structure should be avoided.

4.1.6 Consideration should be given to the effects of clutter on exposed weather decks and the use of radar absorbent materials both of which can significantly reduce the radar cross section.

4.2 Use of aluminium alloys

4.2.1 Due to the poor performance of aluminium alloys at high temperatures they are generally not to be used for items of main hull structure unless suitable insulation is arranged. Safety critical items such as life boat davits, ladders, fire main supports, emergency escape route bulkheads and floor plates, etc., are not to be constructed of aluminium alloys.

■ Section 5 Military design requirements

5.1 RAS seating and support structure

5.1.1 The strength of seats and supporting structure is to be sufficient to withstand the forces imposed by the equipment for all possible operating conditions and loads from ship motions, see Pt 5, Ch 3,5.3. Design calculations are to be submitted.

5.1.2 The seating and supporting structure is to be tested in accordance with Naval Authority requirements. Care is to be taken to ensure that the test arrangements represent the actual magnitude and direction of loads, and that the loading is applied to all relevant parts of the supporting structure rather than local items only.

5.1.3 Guidance on the loads and requirements for replenishment at sea operations are given in Ch 2,9.2.

5.1.4 A sufficient deck area clear of projections and equipment suitably strengthened for impact loading is to be provided for the landing of stores and equipment.

5.1.5 RAS equipment is to be designed in accordance with the requirements of the Naval Authority, see Pt 1, Ch 2,2.2.6 and Vol 3, Pt 1, Ch 7.

5.2 Vehicle and equipment holding down arrangements

5.2.1 The strength and stiffness of the holding down arrangements and the supporting structure under is to be sufficient to withstand the forces imposed by the vehicle(s) and or equipment for all possible operating conditions and loads from ship motions, see Pt 5, Ch 3,5.4. The design calculations are to be submitted.

5.3 Masts and externally mounted sensors or equipment

5.3.1 Masts are to be of adequate strength and stiffness for the equipment they support. The design calculations are to be submitted.

5.3.2 The excitation of the mast by ship motions, machinery, propellers and equipment is to be specially considered and the designers calculations are to be submitted. In general, ship motions can be estimated from Pt 5, Ch 3,2 and the mast natural frequencies are not to be within a band ± 20 per cent of significant excitation frequencies. See also Pt 6, Ch 2,4.

5.3.3 The effect of ice accretion, see Pt 5, Ch 2,4, is to be considered when assessing the strength and support structure of masts. Further consideration is to be given to the increased loading caused by ice accretion on the structure, due to ship motions.

5.3.4 Structure supporting radar or equipment critical to the operation of ship systems is to be of adequate stiffness to maintain the alignment of the equipment within the tolerance agreed with the manufacturer.

5.3.5 The mast should be designed and sited such that it produces minimum interference with the ships sensors and equipment.

5.3.6 Suitable permanent access arrangements are to be provided inside and on the exterior of the mast for maintenance of the structure and equipment. Provision is to be made for the drainage of water from all parts of the mast, both internal and external. Where applicable, protective coatings are to be applied in accordance with the requirements of Pt 6, Ch 6,2.6. In certain cases an increased corrosion allowance (e.g. at the mast base) should be considered.

5.3.7 Mast support arrangements are to be of suitable strength and stiffness and fully integrated into the hull or superstructure. The design calculations and arrangements are to be submitted.

5.3.8 For equipment distributed along the length of the ship, consideration is to be given to the global stiffness of the ships' hull girder in relation to the alignment tolerances required for the equipment (increasing hull stiffness is not normally an efficient option).

5.3.9 High powered transmitting equipment where fitted is to be considered for the effects of electromagnetic influence on adjacent equipment and manned spaces.

5.4 Towed arrays, towed bodies and towing points

5.4.1 The support structure of towed systems is to be suitably integrated into the main hull structure. Any additional primary stiffening is to be extended for at least three frame spaces forward and aft of the equipment.

5.4.2 The towing point and associated equipment is to be located over a primary longitudinal girder and preferably supported by a transverse web frame. The designers calculations are to be submitted for the supporting structure using the 1,5 times the maximum breaking load of the cable.

5.4.3 Towed array handling equipment is to be designed in accordance with the requirements of the Naval Authority, see Pt 1, Ch 2,2.2.6. The seating of array handling equipment is to be adequately supported.

5.5 Crane support arrangements

5.5.1 Crane pedestals are to be efficiently supported and in general, are to be carried through the deck and satisfactorily scarfed into the surrounding structure. Alternatively, crane pedestals may comprise a foundation, in which case the foundation and its supporting structure are to be of substantial construction. Proposals for other support arrangements will be specially considered.

5.5.2 The scantlings of masts and derrick posts, intended to support derrick booms, conveyor arms and similar loads, and of crane pedestals are to be designed in accordance with the requirements of the Naval Authority, see Pt 1, Ch 2,2.2.6. When submitting plans for the proposed foundation, the design calculations are to be included.

5.5.3 Deck plating and underdeck structure are to be reinforced under masts, derrick posts or crane pedestals, and where the deck is penetrated the deck plating is to be suitably increased.

5.5.4 The pedestal or proposed arrangement is to be designed with respect to the worst possible combinations of loads resulting from the crane self weight, live load, wind and crane accelerations together with those resulting from the ship's heel and trim. The designers calculations are to be submitted.

5.5.5 Stowage arrangements are to be taken into account when calculating the loads applied to the pedestal.

5.5.6 Insert plates are to be incorporated in the deck plating in way of crane foundations. The thickness of the insert plates is to be as required by the designer's calculations but is in no case is to be taken as less than 1,5 times the thickness of the adjacent attached plating.

5.5.7 All inserts are to have well radiused corners and be suitably edge prepared prior to welding. All welding in way is to be double continuous and full penetration where necessary. Tapers are to be not less than three to one.

Section 6 Magazine design and construction

6.1 General

6.1.1 The design, construction and maintenance of magazines are to be in accordance with Naval Authority Regulations. All Regulations, recommendations and requirements are to be confirmed to have been applied. See Pt 1, Ch 2,1.1.12.

6.1.2 Where Naval Authority Regulations are not specified the following requirements apply. Risk assessment may be used to justify alternative arrangements. This is to be approved by the Naval Authority or organisation acting on the Naval Authorities behalf. All recommendations and requirements are to be demonstrated to have been applied.

6.1.3 A statement of magazine requirements is to be defined and is to include:

- (a) Armaments requirement; listing the expected munitions and material to be carried in magazines. Identifying the items which can or are to be co-located and those which must be stored separately or separated. Any special requirements for the storage of particular items are also to be listed including:

- (i) environmental conditions; and
- (ii) conductive deck coating requirements.
- (b) Construction materials requirement; describing the permissible materials or required alternatives for magazine structures and munition stowages.
- (c) Magazine Labelling requirement; describing the required labels and their locations.
- (d) Fluid Systems requirement; describing the operating fluids and operating pressures of all fluid systems within the magazine boundaries.
- (e) Munition handling requirement: describing the equipment and space requirements to enable the munitions to be safely handled, maintained and stowed.

6.1.4 Munition securing and handling equipment is to be in accordance with requirements of the Armaments Requirement or, with special consideration, LR's LAME Code. Explosive stores are to be classified and stowed in accordance with the armament requirement, see 6.1.3.

6.1.15 Ready use magazines are not be used for the permanent stowage of munitions. They are to comply with the requirements of this Section for the appropriate magazine type.

6.2 Definitions

6.2.1 Munitions are a complete device (e.g. missile, shell, mine, demolitions store, etc., charged with explosives, propellant, pyrotechnics, or initiating composition), for use in conjunction with offensive, defensive, training, or non-operational purposes, including those parts of the weapon systems containing explosives.

6.2.2 Explosives are all weapons, missiles or stores containing substances especially designed to produce an explosive, propulsive, incendiary or pyrotechnic effect for use in conjunction with offensive, defensive, training, or non-operational purposes.

6.2.3 Integral magazines are those which are bounded by the elements of the main hull structure. They are specifically designed and constructed for the safe permanent stowage of the main outfit of designated munitions defined in the armaments requirement, see 6.1.3.

6.2.4 Independent magazines are those that are non integral, portable magazines greater than 3 m³ and the requirements for integral magazines are to be applied where applicable.

6.2.5 Small magazines are compartments opening off the upper deck which are of shape and size which does not permit walk-in and where the contents are handled from outside. Small magazines are to be specifically designed and constructed for the safe permanent or ready use stowage of munitions defined in the armaments requirement, see 6.1.3.

6.2.6 Magazine lockers are magazines less than or equal to 3 m³, designed and constructed for the safe stowage of explosive stores for which in built magazine facilities have not been provided. They are to be free standing and surrounded by an air gap such that they do not have an adjacent compartment.

6.2.7 Magazine boxes are non-integral, portable magazines with a capacity less than or equal to 3 m³ and capable of being jettisoned overboard.

6.2.8 Pyrotechnics lockers are to comply with the requirements for small magazines, magazine lockers or boxes as appropriate.

6.2.9 Class A fire divisions are those divisions formed by bulkheads and decks which comply with the requirements of IMO resolution MSC 61 (67) *Fire test procedures code*, Annex 1, Part 3.

6.2.10 Flash is a product of an explosion embracing transient flame and associated pressure wave and the electromagnetic wave.

6.2.11 Designated danger areas are compartments and spaces not fitted out specifically for the stowage of munitions, but where munitions are occasionally present.

6.3 Arrangement of magazines

6.3.1 Integral magazines and small magazines containing munitions or propellant are not to be sited adjacent to high fire risk and other compartments of high fire risk listed below:

- (a) Machinery spaces of category A.
- (b) Galleys.
- (c) Switch boards or electrical control rooms.
- (d) Tanks containing liquids with a flashpoint lower than 60°C or with a temperature above 32°C.
- (e) Compartments containing liquid oxygen.
- (f) Fuel, petrol, oil or lubricant pump spaces.
- (g) Accommodation spaces.
- (h) Control Spaces.

6.3.2 Access is not permitted from any of the spaces defined in 6.3.1, to the magazine.

6.3.3 For ships where the above arrangement is completely impracticable the magazine is to be separated from the high risk space by a minimum 600 mm wide cofferdam and constructed of steel or an A-30 fire division. Cofferdams are to comply with the requirements of Pt 3, Ch 2,4.10, are to be ventilated and are not to be designed or used for stowage purposes.

6.3.4 No gasoline or pressurised bottle stowage is to be within a 6 m radius of any magazine or locker.

6.3.5 Integral magazines and small magazines containing munitions may be sited adjacent to the following compartments of moderate fire risk provided that they are separated by an A-30 fire division:

- (a) Auxiliary machinery spaces including pump rooms air condition plant spaces, refrigeration compartment spaces and hydraulic compartments not containing flammable hydraulic fluids.
- (b) Service spaces, including laundries and workshops.
- (c) Uptakes and downtakes.
- (d) Hangars, docks and vehicle decks.
- (e) Paint, flammable, battery and acid stores.
- (f) Tanks or compartments containing independent tanks, of liquids other than sea or fresh water.

6.3.6 Magazine lockers are to be sited in a safe location on a weather deck, surrounded by an air gap of at least 300 mm on all sides and where applicable protected from direct sunlight by fitting solar cladding over top and sides with an air gap of at least 25 mm.

6.3.7 Within magazines arrangements are to be such to ensure that all munitions, including those in transit packaging, are safely stowed and suitably restrained in their stowage for predicted motions and environmental conditions as identified in the armaments requirement. Separate stowage is to be provided for each type of explosive except where specified by the armaments requirement, see 6.1.3.

6.3.8 Magazines are to provide suitable electro-magnetic screening and earthing arrangements for munitions as identified in the armaments requirement, see 6.1.3.

6.3.9 Magazine boxes are to be sited on a weather deck with an air gap of at least 300 mm between the box and the deck or surrounding deck houses. They are to be located in a position suitable for jettisoning of the contents and capable of remote release.

6.3.10 Detonators are to be stowed separately from other explosives in dedicated lockers or storerooms, such spaces are to be treated as designated danger areas. Co-location may be allowed as identified in the armaments requirement, see 6.1.3 (a).

6.4 Structure

6.4.1 Integral magazines are to be of permanent watertight or gastight construction (see Pt 3, Ch 2,1.3 and 7.7) and formed by permanent A-15 class divisions. A-0 class divisions may be allowed if spaces adjacent to the magazine do not contain flammable products.

6.4.2 Independent magazines are to be of weathertight metal construction, see Pt 3, Ch 2,1.3. The interior is to be insulated with a non-combustible insulation providing an A-15 standard.

6.4.3 Magazine lockers and magazine boxes are to be constructed of steel. Other material may be accepted as identified in the construction materials requirement, see 6.1.3.

6.4.4 The scantlings of integral magazine boundaries are to be determined from Table 3.3.15 in Pt 6, Ch 3 for NS1 ships and the general plating and stiffening equations in Pt 5, Ch 3,5.8 for other ships. The design pressure, P_{mag} , is to be derived as shown in Pt 5, Ch 3,5.11.

6.4.5 If venting from the magazine space is via a vent trunk, the required scantlings for the vent trunk structure are to be calculated as for magazine boundary requirements.

6.4.6 Vent plate structure and fittings are to be designed to meet the appropriate deck or bulkhead pressure requirements according to location.

6.5 Environmental conditions and ventilation

6.5.1 The temperature of the magazine is to be maintained at the environmental conditions required by the armaments requirement, see 6.1.3. Generally munitions are to be stored at temperatures greater than 7°C and less than 35°C with a relative humidity between 30 and 70 per cent. Munitions with propellant are to be maintained below 32°C.

6.5.2 The air conditioning may be recirculatory if confined to the ventilation of magazines only. If the magazine is to be ventilated with other compartments then the magazine is to vent to atmosphere. High fire risk and high value compartments should not share ventilation with magazines.

6.5.3 Where a magazine or magazine complex may require to be manned, fresh air make up, via the Air Filtration Unit is to be provided.

6.5.4 Emergency life support apparatus is to be sited in magazines where personnel are required to be permanently working.

6.5.5 Ventilation trunking is to be of an equivalent fire integrity standard as the magazine.

6.5.6 Air conditioning and ventilation systems are to be designed to maintain watertight integrity and flash.

6.6 Detail arrangements

6.6.1 Clear labelling of all magazine openings and equipment is to be maintained in accordance with the magazine labelling requirement, see 6.1.3. The following requirements are to be applied as a minimum:

- (a) Integral, small and independent magazines:
 - (i) the space is a magazine.
 - (ii) open lights and flame are to be kept away.
 - (iii) the magazine door is to be kept shut.
 - (iv) sources of ignition such as matches; lighters and pocket torches are to be removed prior to entry.
 - (v) not to lift with contents (in the case of independent magazines).
 - (vi) magazine otherside markings in adjacent compartments.
- (b) Magazine lockers and boxes:
 - (i) the container is a magazine locker or box.
 - (ii) open lights and flame are to be kept away.
 - (iii) the box is to be kept shut.
 - (iv) not to lift with contents.

6.6.2 Magazines are to be insulated with non-combustible material as necessary to prevent the condensation of moisture.

6.7 Openings

6.7.1 Openings in the magazine and lockers such as doors, hatches and escape scuttles are to be of equivalent strength and fire integrity as the surrounding structure.

6.7.2 Accesses to magazines are to be fitted with suitable security arrangements to prevent unauthorised access. Openings are to be capable of being secured from the inside and fitted with external locks. Emergency escapes are to be opened from the inside only.

6.7.3 Locking arrangements on all magazines and lockers are to be designed to prevent the possibility of entry by removing the hinge pins.

6.8 Piping, cabling and electrical systems

6.8.1 In order to eliminate potential sources of ignition in a magazine in which flammable mixtures are liable to collect, hazardous areas for magazines are to be identified and electrical equipment within the magazine is to be selected and installed in accordance with the requirements of Vol 2, Pt 10, Ch 1,13.

6.8.2 Lighting is to be operated from outside the space. Indication is to be provided at the switch location when circuits are energised.

6.8.3 All apparatus fitted in magazines is to be capable of being isolated on all poles from any source of electrical energy. The preferred method of isolation is by means of a multipole switch. Services that operate on low power at low voltage and are required to operate continuously do not require local isolation. Fire and flood detection and internal communications systems are included amongst such services.

6.8.4 Only services which are required for equipment in the magazine are to penetrate boundaries of the magazine.

6.8.5 Air and hydraulic systems used within magazines are to be low pressure systems only. Non-flammable hydraulic fluid is to be used.

6.8.6 Electrically controlled handling machinery may be fitted in magazines that continuous earth monitoring is provided in the control circuits of the machinery.

6.8.7 Equipment and light fixtures installed in magazines which may be subjected to mechanical damage are to be equipped with suitable protection against such damage. All protective metal guards for apparatus and cabling as well as the apparatus itself must be effectively earthed. Where required conduit is to be electrically continuous and bonded to earth to form an effective shield.

6.9 Fire protection

6.9.1 Integral and small magazines are to be fitted with a spray system capable of rapid reaction, with manual activation and a suitable permanent drainage system.

6.9.2 The spray system is to be capable of delivering 30 litres/m²/min. Large compartments may be fitted with independent spray systems covering separate areas.

6.9.3 Spray heads are to be arranged within magazines so that all stowages and boundaries are covered when sprayed.

6.9.4 Spray systems for integral magazines are to be fed from two separate sections of the ship's water supply.

6.9.5 Magazine lockers and boxes are to be fitted with flood and drainage systems. The flood system is to be operated by a manual control adjacent to the locker but at least 5 m away or 3 m if suitably screened and fed from a pressurised water supply.

6.9.6 Compartments other than tanks or void spaces adjacent to magazines are to be fitted with smoke or fire detectors.

6.9.7 Locking arrangements are to be fitted to all spray, flooding, drain valves and cocks with the exception of spray control valves when housed in a lockable cabinet.

6.9.8 Magazines are to be provided with fire extinguishers commensurate with risk classification, size and type of vessel. Generally one extinguisher should be fitted on the inside and one on the out side of the magazine.

6.9.9 Designated danger areas (DDA) where munitions are handled such as weapon lifts, transfer passages, weapon preparation areas, hangars, flight decks, docks and RAS points are to be fitted with similar fire protection systems to the magazine, commensurate with the risk classification and type of vessel. LR may allow system requirements to be reduced to the provision of sufficient hose points based on the risk classification.

6.9.10 Magazines are to be coated with fire resistant paint and the deck covering is to be non spark and non slip. Any requirements for a conductive deck area and personnel will be identified in the armaments requirement, see 6.1.3. Where there is a conducting deck requirement an anti static precaution notice is to be displayed.

6.10 Testing

6.10.1 Magazines are to be tested in accordance with the gas tight requirements of Pt 6, Ch 6,6.8.

Section 7

Design guidance for nuclear, biological and chemical defence

7.1 General

7.1.1 The arrangements of hull structure for chemical, biological, radiological and nuclear defence (CBRN) are to generally be in accordance with the requirements of this Section. The final design and arrangements are to be in accordance with the requirements of the Naval Authority. Where specifically requested, LR can undertake the inspection and certification of CBRN arrangements or gas tight integrity, see Pt 6, Ch 6,6.8.

7.1.2 The subdivision of the ship for CBRN defence is achieved by the provision of zones which minimise the consequences of an attack. The zone boundaries provide protective barriers to resist the spread of primary and secondary weapon effects.

7.1.3 The number and location of zone boundaries and distribution of systems within those zones is best determined by carrying out a vulnerability analysis as detailed in Section 2.

7.1.4 The effect of zones on, and requirements for damage control should also be considered. This is best assessed by testing the zone arrangement with a series of 'what if' damage scenarios. A good zone arrangement will aid damage control.

7.1.5 An effective CBRN defence is to comprise of three distinct phases:

- Monitoring and detection by the provision of systems to detect the presence of and to identify the threat both outside the ship and within the zones.
- Protection of the ship and crew, using a pressurised citadel and zones with gas-tight boundaries and airlocks. Protection is also achieved with the filtration of air drawn into the ship and enclosing machinery intakes and exhausts.
- Decontamination of spaces within the ship is achieved using a suitable ventilation and filtration system. Decontamination of the ship itself is largely achieved using pre-wetting systems. For the crew and equipment, cleansing stations can be used.

7.2 Definitions

7.2.1 A citadel is the gastight envelope of the hull and superstructure. It consists of a group of interconnecting compartments enclosed by a gas-tight boundary with the independent systems necessary to provide a toxic free area free from any CBRN hazard. Large ships may have sub-citadels or more than one citadel.

7.2.2 A zone is a smaller group of compartments within the citadel with some or all of the independent systems necessary to provide a toxic free area that is free from any CBRN hazard.

7.2.3 An airlock is a compartment with two doors between the toxic free area and the source of the CBRN hazard or cleansing station. Airlocks are normally purged with clean air to allow personnel to pass from one area to another without contaminants entering the toxic free area.

7.2.4 A cleansing station is a group of compartments suitably arranged and equipped whereby CBRN decontamination of personnel and materials can take place.

7.2.5 Individual protective equipment is the personal clothing and equipment required to protect an individual from CBRN hazard. It normally consists of a protective suit and respirator.

7.3 NS1 and NS2 ship requirements

7.3.1 The requirements of this Section deal only with the hull structure and mainly involve the arrangement of major divisions within the hull. Provision is to be made within the layout and design of the ship for the compartments required for CBRN defence. As a consequence they are to be considered from a very early stage in the design and in consultation with the Naval Authority, Owner, designer and LR.

7.3.2 Unless otherwise required by the Naval Authority, the citadel's length is to be divided into zones. It is recommended that the zone boundaries coincide with main transverse watertight bulkheads and extend from the keel to the highest superstructure deck.

7.3.3 A suitable pressure above atmospheric is to be maintained inside the citadel and zones. Zones with a higher risk of contamination are to be maintained at a lower pressure than the adjacent zones but higher than atmospheric. For example those containing machinery spaces with ventilation to atmosphere open during CBRN conditions.

7.3.4 For NS1 ships at least three cleansing stations are to be provided in separate zones. For NS2 ships at least two cleansing stations are to be provided in separate zones. They are to be located so that safe and direct entry is possible from the weather deck. One cleansing station is to be located close to the medical complex with access for stretcher borne casualties.

7.4 NS3 ship requirements

7.4.1 The requirements of this Section deal only with the hull structure and mainly involve the arrangement of major divisions within the hull. As a consequence they are to be considered from a very early stage in the design and in consultation with the Naval Authority, Owner, designer and LR.

7.4.2 For NS3 ships it may be impractical to provide zones and a citadel. In this case CBRN protection is to be provided by either individual protective equipment or sanctuaries.

7.4.3 Sanctuaries may be integral or temporary compartments on board the ship and are to be provided with an airlock, cleansing station and ventilation systems similar to that of a zone.

7.4.4 If individual protective equipment is provided arrangements are to be made to ensure that operation of the ship is possible such that it can reach a suitable place of refuge. For example, crew provisions, equipment and compartment accesses are to be suitable for persons wearing individual protective equipment.

7.5 Zones

7.5.1 The boundaries of zones are to be gastight and are to be tested in accordance with Pt 6, Ch 6,6.8. Ventilation and trunking is not to pass through zone boundaries.

7.5.2 Each zone is generally to be provided with a total air conditioning system. All air entering the citadel is to pass through CBRN filters. These filters may be bypassed when the ship is not in a threat situation.

7.5.3 Consideration is to be given to the provision of independent services in each zone for the following systems:

- (a) Electrical power generation and distribution.
- (b) Chilled water cooling.
- (c) Fire pumps, piping and hydrants (including pre-wetting).
- (d) Bilge pumps, piping and discharge.
- (e) Internal communications.
- (f) Machinery or damage control surveillance or control.
- (g) Compressed air.
- (h) Emergency crew support.
- (j) Smoke clearance arrangements.
- (k) Air start arrangements in the appropriate zones.

7.5.4 At least two airlocks to the weather decks are to be provided in each zone. Access between zones are to be fitted with airlocks. Consideration is to be given to providing gas-tight connections adjacent to this access for the provision of the services listed in 7.5.3.

7.5.5 Consideration should be given to the use of materials that do not emit toxic fumes.

7.6 CBRN hardening

7.6.1 In determining the layout and design of the ship consideration should be given to the hardening of the ship to improve its capability in an CBRN environment.

7.6.2 All external compartments and equipment not included in the citadel should be sealed or designed such that residual contaminants cannot be trapped.

7.6.3 All access for operation and maintenance of equipment should be designed for personnel wearing individual protective equipment.

7.6.4 Shelters are to be provided deep within the ship for the temporary protection from radiation of the crew during nuclear attack.

7.6.5 Command and control centres should ideally be sited such that they are afforded the maximum protection against radiation from nuclear attack. All essential equipment should be designed to resist incident nuclear radiation (INR) and nuclear electro-magnetic pulse (NEMP).

8.1.7 Wherever possible, gratings or anti-sabotage bars fitted to underwater openings are to be arranged across and aligned with the flow of the water past the ship so as to minimise turbulence. They should be deep in section and have well radiused edges.

7.7 Structural requirements

7.7.1 The scantlings of all gastight zone, citadel and airlock boundaries are to be capable of withstanding two times the maximum differential pressure that can occur in service and the scantlings are to be calculated in accordance with the relevant Sections of Pt 6, Ch 3. Gas-tight boundaries are to be tested in accordance with Pt 6, Ch 6,6.8.

7.7.2 All openings in gastight boundaries are to be fitted with gastight closing appliances and tested in accordance with Pt 6, Ch 6,6.8 and are to be of equivalent strength to the structure in which they are placed.

7.7.3 Watertight and weathertight closing appliances may be considered gas-tight if a pressure greater than atmospheric is, and can be maintained inside the zone, citadel or airlock.

■ Section 8 Design guidance for the reduction of radiated noise underwater due to sea-inlets or other openings

8.1 General

8.1.1 The number of underwater openings should be kept to a minimum.

8.1.2 To aid in the reduction of underwater radiated noise, sea tubes and/or boxes are to be provided for each sea water hull inlet or outlet. Where a number of openings are adjacent, consideration should be given to fitting a common plenum chamber with a single opening in the outer bottom. Care must be taken to avoid resonance of the chamber.

8.1.3 The outside of all underwater openings is to be flush with the surrounding hull plating. Particular care is to be taken to provide smooth surface on the inside of all sea-tubes and discharges.

8.1.4 For sea openings required to be blanked, a smooth mating face surrounding the sea tube on to which the mating flange of the blank can sit is to be provided.

8.1.5 Adequate protective coating and cathodic protection should be considered at the interface of the valve and sea tube.

8.1.6 No underwater opening, at a level lower than the deep design draught, is to be fitted within 6 m of the aftermost part of the aft sonar dome.

Military Load Specification

Volume 1, Part 4, Chapter 2

Sections 1 & 2

Section

- 1 **General requirements**
- 2 **External blast**
- 3 **Internal blast**
- 4 **Fragmentation protection**
- 5 **Underwater explosion (shock)**
- 6 **Whipping**
- 7 **Residual strength**
- 8 **Strengthening requirements for beach landing operations**
- 9 **Military installation and operational loads**
- 10 **Aircraft operations**

■ Section 1 General requirements

1.1 General

1.1.1 This Chapter contains design requirements that have to be complied with as part of **100A1** classification, ship type or a special notation such as **IB**.

1.1.2 Where significant regions of the hull structure are rendered ineffective by the threat under consideration, a residual strength calculation is to be carried out to verify the capability of the remaining structure.

1.1.3 For structure designed in accordance with the appropriate Sections of this Chapter the following notations will be assigned. The level of threat and notation will remain confidential to the Owner and Lloyd's Register (hereinafter referred to as 'LR') unless requested otherwise.

- **EB** for external blast assessment.
- **IB** for internal blast assessment.
- **FP** for fragmentation protection.
- **SP** for small arms protection.
- **SH** for assessment against underwater explosion (shock).
- **WH** for whipping assessment.
- **RSA** for a residual strength assessment, see Pt 6, Ch 4.4.

1.1.4 The notations that are applicable for a particular ship are to be agreed between the builder or designer, Owner, Naval Authority and LR as defined in Chapter 1.

■ Section 2 External blast

2.1 General

2.1.1 Structures and their response to air blast loadings, can be considered to fall into two categories:

- Diffraction-type structures.
- Drag-type structures.

2.1.2 In a nuclear type explosion, the diffraction-type structures would be affected mainly by diffraction loading and the drag-type structures by drag loading.

2.1.3 Large flat sided structures, with few openings, will respond mainly to diffraction loading because it will take an appreciable time for the blast wave to engulf the structure and the pressure differential between front and rear exists during the whole of this period. A diffraction-type structure is primarily sensitive to the peak overpressure in the shock wave to which it is exposed.

2.1.4 If structures are small, or have numerous openings, the pressures on different areas of the structure are quickly equalised; the diffraction forces operate only for a very short time. The response of this type of structure is then mainly due to the dynamic pressure (or drag forces) of the blast wind. This is typical of masts and funnels. The drag loading on the structure is determined not only by the dynamic pressure but also by the shape of the structure. The drag coefficient is less for rounded or streamlined structures than for irregular or sharp edged structures.

2.1.5 The relative importance of each type of loading in causing damage will depend upon the type of structure as well as the characteristics of the blast wave.

2.2 Threat level determination

2.2.1 Ships complying with the requirements of this Section will be eligible for the notation **EB1**, **EB2**, **EB3** or **EB4** as defined in 2.3.

2.2.2 External blast loading can come from a variety of threats the two main ones are far field from nuclear or fuel air type threats and near field from detonation by close in weapon systems. This part of the Rules is concerned only with the far field explosions.

2.2.3 The actual threat level used in the calculation of performance and the areas of the ship to be protected by this design method are to be specified by the Owner and will remain confidential to LR.

2.3 Notation assessment levels and methodology

2.3.1 Design to withstand increasing levels of blast pressure needs to employ increasing sophistication and complexity of analysis method if the structure is to be kept lightweight.

2.3.2 An **EB1** assessment method may utilise the simple design methodology suggested in 2.8 for structural assessment. The design criteria should ensure that the structure behaves in an elastic perfectly plastic manner with small displacements when subjected to the proposed blast level.

2.3.3 An **EB2** assessment method may utilise an extension of simple design methodology suggested in 2.8 to look at the elasto-plastic behaviour for the structural assessment. The structure is to be designed such that maximum displacements experienced by all structure does not compromise the structural integrity, water or gas-tight integrity or functioning of critical items of equipment required for operation of the ship and systems that is attached or adjacent to the structure.

2.3.4 An **EB3** assessment method should employ a failure criterion based on an elasto-plastic methodology which considers the following structural responses:

- Local response of the plating, here the plating can be represented as a 2-D plate strip and a large displacement, elasto-plastic dynamic response analysis carried out using a beam-column approach.
- Local bending response of stiffened panels, the preferred model will be to evaluate the non-linear dynamic response of a single stiffener with an attached strip of plating modelled as a beam-column with the appropriate boundary conditions under blast pressure.
- A lumped parameter model can be employed to look at 'overall sidesway' response of a ships superstructure.

The structure is to be designed such that maximum displacements experienced by all structure does not compromise the structural integrity, water or gas-tight integrity or functioning of critical items of equipment required for operation of the ship and systems that are attached or adjacent to the structure.

2.3.5 An **EB4** assessment method should employ a full non-linear analysis using finite element methods to predict the structural response. Using this methodology it is assumed that the ship must survive, this implies the need to retain primary hull structural integrity, water and gas-tight integrity or functioning of critical items of equipment required for operation of the ship and systems that is attached or adjacent to the structure.

2.3.6 For **EB3** and **EB4** notations, the assumptions made for initial deformations are to be submitted. Where these differ for normal ship building practice, the details are to be recorded on the approved plan.

2.4 Definitions

2.4.1 Atmospheric pressure P_o is to be taken as 101,3 kN/m².

2.4.2 The dimensions of superstructure blocks are given in Fig. 2.2.1.

Fig. 2.2.1 Superstructure definitions

2.5 Blast pressure loads

2.5.1 For explosions of different magnitude, the range at which the peak blast incident and dynamic pressures occur can be scaled using the following equation:

$$D_i = D_n \left(\frac{1000}{W} \right)^{1/3}$$

where

D_i = incident distance

D_n = distance at which the pressure occurs, in metres

W = equivalent weight of TNT for the explosive, in kg.

2.5.2 Similarly for weapons of a different magnitude, the duration, t_{p+} , of a blast can be scaled using the scaling equation:

$$t_i = t_n \left(\frac{1000}{W} \right)^{1/3}$$

where

t_i = incident duration

t_n = duration the pressure occurs, in seconds

W = equivalent weight of TNT for the explosive, in kg.

2.5.3 When a pressure shock front strikes a solid surface placed normal to the direction of shock travel there is an instantaneous rise in pressure above that of the shock front itself. The total pressure referred to as the reflected pressure is given by:

$$P_r = 2P_i (7P_o + 4P_i) / (7P_o + P_i) \text{ kN/m}^2$$

when $P_i \ll P_o$ (small charge at large standoff) P_r may be taken as $2P_i$ similarly when $P_i \gg P_o$ (large charge at short range) P_r may be taken as $8P_i$

where

P_i = peak blast incident overpressure in kN/m² from Fig. 2.2.3.

2.5.4 The reflected pressure, P_r can be assumed to diminish linearly until it reaches the stagnation pressure, P_s , at time, t_s , where

$$t_s = 3d/U \text{ seconds}$$

where

d = is the lesser of h or $l/2$ in metres, see Fig. 2.2.1

U = shock front velocity in m/s

$$= U_o \sqrt{1 + 6P_i/7P_o}$$

Military Load Specification

Volume 1, Part 4, Chapter 2

Section 2

$$U_0 = \text{speed of sound in air in m/s} \\ = 332 + 0,6T_0 \\ T_0 = \text{ambient air temperature in } ^\circ\text{C}.$$

2.5.5 The passage of the blast is immediately followed by a transient 'blast wind' that exerts a supplementary dynamic pressure which is given by:

$$q_i = 2,5 (P_i^2 / (7P_0 + P_i)) \text{ kN/m}^2$$

where

P_i = peak blast incident overpressure in kN/m² from Fig. 2.2.3

The duration of the dynamic pressure, t_{q+} , can be determined from Fig. 2.2.3.

2.5.6 The stagnation pressure, P_s , is determined for the front of the superstructure block by:

$$P_s = P_i + C_D q_i \text{ kN/m}^2$$

and for the top, sides and rear by

$$P_s = P_i - C_D q_i \text{ kN/m}^2$$

where

P_i = peak incident pressure from Fig. 2.2.3

q_i = the dynamic pressure from 2.5.5

C_D = the drag coefficient of the structure from Table 2.2.1.

Table 2.2.1 Drag coefficients

Structure	Drag coefficient, C_D
Ship sides	+1,0
Front face	+1,0
Top and sides	
0–170 kN/m ²	+0,4
170–340 kN/m ²	+0,3
340–930 kN/m ²	+0,2
Masts and funnels	+0,75

2.5.7 For the top and sides of the superstructure the peak pressure will occur at time t_t which is given by:

$$t_t = b/U \text{ seconds}$$

where

b = superstructure breadth in metres, see Fig. 2.2.1

U = shock front velocity in m/s, see 2.5.4.

2.5.8 For the rear of the superstructure the peak pressure will occur at time, t_r , which is given by:

$$t_r = b/U + 4d/U \text{ seconds}$$

where

d = is the lesser of h or $l/2$, in metres, see Fig. 2.2.1

b = superstructure breadth, in metres, see Fig. 2.2.1

U = shock front velocity, in m/s.

2.5.9 Pressure distributions for the faces of the superstructure block are given in Fig. 2.2.2, together with the overall pressure acting on the block which is obtained by subtracting the forces on the rear face from those on the front.

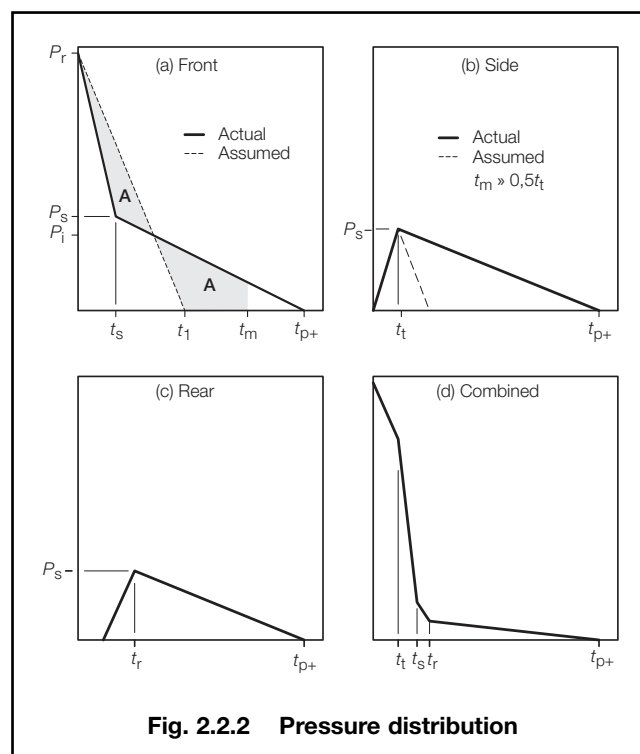

Fig. 2.2.2 Pressure distribution

2.6 Nuclear threats

2.6.1 An atmospheric nuclear explosion is most likely to occur at some height above ground level at a location known as ground zero, which may be optimised to produce maximum damage effects. The blast wave is reflected from the surface and at a certain distance from ground zero, primary reflected waves combine to form a vertical 'mach' front or stem that propagates outwards from ground zero with diminishing intensity. The peak blast incident over pressure P_i can be determined from 2.3.

2.7 Fuel air pressure loads

2.7.1 In general a structure designed to resist a moderate degree of nuclear blast will also have a reasonable resistance to fuel air threats and calculation are not normally required.

2.7.2 Where there is a risk of fuel air explosions, and for ships for which there is no nuclear threat position required, consideration needs to be given to the blast wave characteristics of such explosions, see also 3.1.7.

2.7.3 The effects of temperature on the material of the structure due to fuel air threats are to be considered using the structure surface temperature.

2.8 Conventional explosive pressure loads

2.8.1 Blast waves caused by free field explosions in air are dependent upon the mass shape and type of explosive, the distance from the target and the height of the burst. As blast waves travel through air, rapid variations occur in pressure, density, temperature and particle velocity.

Fig. 2.2.3 Blast parameters for TNT and nuclear explosions

Military Load Specification

Volume 1, Part 4, Chapter 2

Section 2

2.8.2 For a given high explosive of an equivalent TNT mass at a direct distance from the target Section 2.3 can be used to determine the blast parameters.

2.9 Structural assessment

2.9.1 The rules for the **EB1** and **EB2** structural assessment are based on the assumption that the structure can be idealised as a single degree of freedom system. They assume that there is no significant loading on the superstructure or ships' sides at the time of the blast. In cases where there are significant lateral loadings or concentrated point loads or fluids, the natural frequency and strength of the structure will be specially considered.

2.9.2 The acceptance criteria contained in this Section assume that the structure is loaded beyond it's elastic limit but not such that significant deformations result.

2.9.3 For plating the thickness is not to be less than:

$$t = \sqrt{\frac{f_{DLF} P_p l s^2}{6 f_\sigma \sigma_o (s + f_p l)}} \text{ mm}$$

where

l = the length of the plate panel, in metres

s = width of the panel, in mm
(short span length)

σ_o = yield stress of the material, N/mm²

f_p = plate aspect ratio factor, see Table 2.2.2

f_σ = stress factor

= 1,3 for $\sigma_o \leq 300$ N/mm²

= 1,2 for $\sigma_o > 300$ N/mm²

P_p = the peak pressure, P_r , for the front of the superstructure, or P_s for the top sides and rear, as defined in 2.5, in KN/m

f_{DLF} = dynamic load factor to be determined from Pt 6, Ch 2,5:

for superstructure front and ship sides using a linearly decreasing load with initially:

$t_1 = P_r t_s / P_s$ seconds

if t_m determined from Pt 6, Ch 2,5 is greater than $1,1 P_r t_s / P_s$ then f_{DLF} is to be recalculated such that:

$$t_1 = t_s + \frac{P_s}{P_r} \left(t_p - t_m \frac{(t_{p+} - t_m)}{(t_{p+} - t_s)} \right) \text{ seconds}$$

For superstructure top, sides and rear using a triangular load with:

$t_1 = 2 t_t$ seconds

$t_1 = 2 t_r$ seconds as appropriate

where

P_r = peak reflected pressure as defined in 2.5.3

P_s = stagnation pressure, as defined in 2.5.6

t_m = time at which maximum deflection occurs

t_{p+} = positive blast pulse duration

t_s = corresponding time at stagnation pressure, P_s .

Table 2.2.2 Plate factors

Aspect ratio (A_R)	f_p
1,0	1000
0,9	916
0,8	858
0,7	817
0,6	775
0,5	750
<0,5	750

2.9.4 The minimum edge through thickness area of the plate is not to be less than:

$$A_t = \frac{1}{100 s \tau_o} (6 f_{p1} t^2 \sigma_o (s + f_p l) + f_{p2} P_{tm} l s^2) \text{ cm}^2$$

where

t , σ_o , l and s are given in 2.9.3

τ_o = shear yield stress in N/mm²

P_{tm} = Pressure at the time of maximum displacement, t_m , in kN/m² based on assumed pressure distribution

f_{p1} , f_{p2} = shear load factors, given in Table 2.2.3.

Table 2.2.3 Plate shear factors

Aspect ratio s/l	short span side s		long span side l	
	f_{p1}	f_{p2}	f_{p1}	f_{p2}
1,0	0,18	0,07	0,18	0,07
0,9	0,16	0,06	0,20	0,08
0,8	0,14	0,06	0,22	0,08
0,7	0,13	0,05	0,24	0,08
0,6	0,11	0,04	0,26	0,09
0,5	0,09	0,04	0,28	0,09

2.9.5 The stiffener and plate combination is considered to be satisfactory if the plastic modulus of the beam plate combination is greater than:

$$Z_p = \frac{f_{DLF} P_p l s l_e}{f_{bz} f_\sigma \sigma_o} \text{ cm}^3$$

where

P_p , f_{DLF} , f_σ and σ_o are given in 2.9.3

Z_p = plastic section modulus of the stiffener and attached plate, in cm³

l_e = effective length of the beam, in metres

l = the length of the beam, in metres

f_{bz} = beam support factor

= 12 for fully fixed

= 8 for simply supported

s = spacing of the beams, in mm.

2.9.6 The maximum elastic deflection given by:

$$\delta_x = 10^5 \frac{f_{DLF} P_p l s l_e^3}{f_{bd} E I} \text{ mm}$$

is not to be greater than

$$\delta_{\max} = \frac{1000l}{115} \text{ mm}$$

where

P_p , f_{DLF} , s , l and l_e are given in 2.9.3

I = second moment of inertia cm^4

f_{bd} = beam support factor

= 384 for fully fixed

= 76,8 for simply supported.

2.9.7 The shear area of the stiffener web is not to be less than:

$$A_\tau = \frac{1}{100\tau_o} \left(\frac{f_{s1} f_{bz} Z_p \sigma_o}{1000l_e} + f_{s2} P_{tm} l s \right) \text{ cm}^2$$

where

Z_p , σ_o , l_e , l and s are given in 2.9.3

τ_o , P_{tm} are given in 2.9.4

f_{s1} , f_{s2} = shear load factors, given in Table 2.2.4

f_{bz} is given in 2.9.5.

Table 2.2.4 Beam shear factors

Beam type	Location	f_{s1}	f_{s2}
Simply supported	Both ends	0,39	0,11
Fixed ends	Both ends	0,36	0,14
Simple and fixed	Fixed end	0,43	0,12
	Simple support	0,26	0,19

2.9.8 Direct calculations or analyses based on the elastoplastic or plastic response of structure using a dynamic load factor or finite element approach will be specially considered. The designers' calculations are to be submitted for approval.

2.9.9 In addition to the assessment of plating and stiffeners, the global capability of superstructure and above water structure are to be assessed. The designers' calculations are to be submitted.

2.10 Design considerations

2.10.1 To minimise the effects of external blast, protrusions from the superstructure are to be kept to a minimum.

2.10.2 Re-entrant corners are to be avoided, where this is impractical they are to be covered by a blast deflecting plate, or be constructed such that the included angle between orthogonal faces is to be as large as possible.

2.10.3 Where the clear air gap between superstructure blocks is less than $0,1L_R$, the interaction under external blast loading will be specially considered.

Section 3 Internal blast

3.1 General

3.1.1 Internal blast is defined as that which occurs from detonation of a high explosive from a hostile weapon or detonation of a ship's own ammunition inside the hull envelope. In an internal explosive loading situation the loading on a boundary can be characterised by a series of decaying reflected pressure waves (blast impulses) followed by the rapid formation of a slowly decaying static pressure (Quasi static pressure QSP) as shown in Fig. 2.3.1.

Fig. 2.3.1 Typical blast pressure time history

3.1.2 The magnitude of the initial blast impulse is related to the distance from structure under consideration to the explosion. The reflections are a function of the compartment geometry. The QSP is dependent on the compartment volume with the rate of decay related to the vent area.

3.2 Threat level determination

3.2.1 The threat protection levels for a given vessel should be determined through a vulnerability analysis against customer specified threat weapons. In the absence of such a study the following levels may be used as a guide:

- Level I Watertight bulkheads at $R_{4N} \geq 1$ and zone bulkheads at $R_{4N} > 1$
- Level II Watertight bulkheads at $R_{4N} \geq 1,5$ and zone bulkheads at $R_{4N} > 2$
- Level III Watertight bulkheads at $R_{4N} > 3$ and zone bulkheads at $R_{4N} > 3$

R_{4N} is the normalised blast resistance 2,5 m high, 4 mm thick, mild steel, fillet welded bulkhead.

3.3 Notation assessment levels and methodology

3.3.1 The Rules are aimed at limiting the spread of blast damage to compartments adjacent to that directly affected by the explosion. For an explosion where the ratio of charge size to compartment volume is small, it may be possible to limit the damage to the affected compartment.

Military Load Specification

Volume 1, Part 4, Chapter 2

Section 3

3.3.2 Ships complying with the requirements of this Section will be eligible for the **IB1** notation. Where further analysis or testing are used to determine the blast resistance of the structure an **IB2** notation may be assigned.

3.3.3 For the **IB2** notation, the assumptions made for initial deformations are to be submitted. Where these differ from normal ship building practice, the details are to be recorded on the approved plan.

3.3.4 There are specific scenarios such as fuel air explosions within aircraft hangars where the internal blast wave characteristics will need to be specially considered on request.

3.4 Materials

3.4.1 For level **III** protection all plate bulkhead materials are to have a sulphur content less than 0,01 per cent. This may be achieved by the specification of through thickness properties in accordance with the requirements of Ch 3,8 of the Rules for Materials.

3.4.2 Consideration should be given to the use of austenitic electrodes for fillet welding of ferritic materials subject to high strain loading. In selecting the filler material, consideration is to be given to the material's proof strength and elongation; the 0,2 per cent proof stress of the filler material as welded is to match the strength of the ferritic parent steel plate, and the elongation to failure is to be as great as possible. Care should be taken to ensure that coatings are maintained as far as practicable. Where such materials are in wet or immersed areas, special attention is to be given to corrosion protection and the selection of a material that is not prone to chemical or electro-chemical attack. Details of the weld procedure are to be submitted for approval.

3.5 Quasi static pressure

3.5.1 Structural failure can be caused by either the impulsive loading or the dynamic loading imparted by the combined blast waves and QSP. Normally if the weapon is sufficiently large to cause failure by impulse it will also fail under a dynamic loading assessment based on a step function to the QSP level. For the purposes of general design the step function to the QSP level assessment can be used as the loading criteria to determine failure. Safety or mission critical areas should be specially considered.

3.5.2 The actual threat level used in the calculation and areas of the ship to be protected are to be specified by the Owner and will remain confidential to LR.

3.5.3 The QSP can be determined from the following:

$$P_{qs} = 2,25 (W_e / V)^{0,72} \times 10^3 \text{ kN/m}^2$$

where

$$P_{qs} = \text{quasi static pressure, in kN/m}^2$$

$$W_e = \text{weapon equivalent weight of TNT, in kg}$$

$$V = \text{free compartment volume, in m}^3.$$

3.6 Structural resistance

3.6.1 The blast resistance for a given bulkhead material, thickness and joint style can be determined as a proportion of 2,5 m high, 4 mm thick, mild steel, fillet welded bulkhead using the following formula based on a combination of explosive tests and analytical techniques:

$$R_{4N} = (K_j + K_m) t / l$$

where

R_{4N} is the normalised blast resistance 2,5 m high, 4 mm thick, mild steel, fillet welded bulkhead

K_m is the material type factor, see Table 2.3.1

K_j is the joint type factor, see Table 2.3.2

t is the thickness of steel, in metres

l is the short span length, in metres.

Table 2.3.1 Material type factor, K_m

Steel grade	K_m
A, D, E, AH32, AH36	0
DH32, EH32	86
DH36, EH36	196

Table 2.3.2 Joint type factor, K_j

Joint style	K_j	Note
Normal fillet weld	625	Valid up for $t_{bh} \leq 8 \text{ mm}$
Full penetration weld	665	Valid for $t_{bh} \leq 12 \text{ mm}$
Austenitic fillet weld	701	Valid for $t_{bh} \leq 6 \text{ mm}$
NOTE Values of K_j up to 1200 can be achieved using blast resistant bulkhead designs.		

3.6.2 The primary mode of failure for bulkhead structures is through the edge connection. Alternatives to the basic fillet weld have been assessed and incorporated in the joint type factor presented in Table 2.3.2.

3.6.3 Alternative joint types may be used but are to be categorised using a dynamic joint test and blast assessment. For novel designs a further large scale controlled blast test of the proposed arrangement is to be tested. LR can provide details of the test and analysis requirements on request.

3.7 Bulkhead arrangements

3.7.1 Piping that passes through the bulkhead is to be fitted with expansion pieces either side of the bulkhead. In addition, piping and other penetrations are to be arranged at the edges of the bulkhead where the relative movement is less as shown in Fig. 2.3.2.

Fig. 2.3.2 Blast bulkhead penetrations

3.7.2 Bulkhead attachments are to be kept to a minimum and designed for good dynamic performance.

3.7.3 The strength of doors if fitted will be specially considered. Steps are to be taken to prevent their detachment from or pushing through the surrounding structure.

3.7.4 Consideration should be given to the use of flexible collars around deep girder penetrations through the blast bulkhead to allow relative movement but retain water-tight or gas tight integrity.

Section 4 Fragmentation protection

4.1 General

4.1.1 This Section does not deal with the loss of structural strength due to material perforation. It is only concerned with fragmentation protection of equipment and personnel within critical compartments and potentially critical pipe and cable runs.

4.1.2 Fragment and small arms penetrators can be stopped by the use of structure designed to prevent penetration, either through the use of increased thickness of normal structural materials, suitable siting of compartments, addition of armour (non-structural) materials, or even the use of armour material that can take structural loads.

4.1.3 The Rules give design data based on fragment penetration equations for three representative threats. The selection and use of fragment penetration equations or computer modelling for other threats will be considered provided they are carried out by a competent body which has relevant experience and employs recognised procedures.

4.1.4 For fragmentation protection to be effective, materials within the ship forming part of the ship's equipment and outfit shall be of a type that is not prone to the generation of secondary fragments or 'splinters'. Materials such as wood, brittle plastics and brittle cast materials is not to be used in protected compartments. Where the use of such materials is essential, consideration may be given to the use of bonded splinter-retaining membranes.

4.1.5 RATTAM is defined as the response to attack on ammunition and describes protection fitted externally to the ship to prevent the penetration of particular threats which may cause damage, principally to magazines. Similar protection may also be fitted to protect other critical compartments, both are covered by the **SP** notation.

4.2 Threat level determination

4.2.1 The threat may be classified as either small arms fire or fragments from the casing of shells or warheads ('shrapnel' or 'splinters') capable of perforating the ships' structure and thus causing damage to equipment or casualties amongst personnel.

4.2.2 Three levels of protection are shown in Table 2.4.1. They are from a combination of internally and externally detonating threats. Alternative levels will be considered in accordance with 4.5.2.

Table 2.4.1 Fragment threat types

Level	Typical threat origin	Fragment weight (g)	Initial fragment velocity (m/s)
I	Aircraft fired 30 mm high explosive (HE) cannon shell	up to 1 g	less than 1250
II	Proximity detonating 105 mm Artillery round	up to 15 g	less than 1250
III	Sea Skimming (SAP) missile	up to 55 g	less than 1400

4.2.3 The actual threat level and type used in the calculation and the areas of the ship to be protected are to be specified by the Owner and will remain confidential to LR.

4.2.4 The Level I threat is assumed to detonate on impact with the ship's structure in the act of which it will penetrate the outer skin of the vessel. Fragmentation protection will reduce the risk of fragments penetrating additional compartments. The ends, internal sides and decks of critical compartment are in general to be fitted with protection, an example of which is shown in Fig. 2.4.1(a), see also 4.3.2. The outer skin of the ship may be strengthened to resist the shell in accordance with the requirements for the **SP** notation, however it will usually require a significant amount of armour.

4.2.5 Level II considers a threat posed by an externally detonating shell. Strengthening is, in general, to be fitted to the external skin of the ship to protect the critical internal spaces, an example of which is shown in Fig. 2.4.1(b), see also 4.3.2. For this level of protection a stand off distance for the weapon is to be specified by the Owner.

4.2.6 The Level III threat is a generic weapon based on a sea skimming anti-ship weapon with a semi armour piercing, (SAP) warhead that detonates within the hull. Fragmentation protection is intended to reduce the risk of fragments penetrating additional compartments. The considerable amount of protection required will normally mean that protection is only fitted at zone boundaries to limit the longitudinal spread of fragments. See example in Fig. 2.4.1(c) and also 4.3.2.

4.2.7 The examples given in Figs. 2.4.1(a) to (c) show a compartment immediately under the main deck with deck-house over subject to a side-on attack. Where the critical compartment is fitted directly below an external deck, in a deckhouse or the threat is directly above the compartment, protection is to be arranged using the principles given in examples in Figs. 2.4.1(a) to (c).

4.3 Notation assessment levels and methodology

4.3.1 The fragmentation protection **FP1** and **FP2** notations are assigned for ships which have protection fitted to resist fragments from the casing of a shell or warhead. The small arms protection, **SP** notation is assigned for ships fitted with protection to resist the penetration of small arms fire into the hull. For ships where the fragmentation resistance is carried out using the Tables and graphs of this Section an **FP1** notation is assigned. Where fragmentation testing or analysis are used to determine the fragmentation resistance required a **FP2** notation is assigned.

4.3.2 The pressure produced by a Level I threat is such that an **IB** notation is not required. The Level II threat is external and of a level such that an **EB** notation will not be required. A Level III threat will require the effect of the internal blast pressure on the structure to be considered and **IB** and **RSA** notations will generally be required.

4.4 Information required

4.4.1 For each threat level it will be necessary to identify the critical compartments requiring protection, plus the critical pipe and cable runs where appropriate. Plans are to be provided showing the location and manner of all fragmentation and terrorist attack protection.

4.4.2 Where alternative tests or calculations have been carried out full details are to be submitted. They are to include details of the organisation involved, their experience, test or calculation procedures and the program or equations used.

4.5 Structural requirements

4.5.1 Where different threats, materials or multiple plate arrays are fitted alternative methods may be used to determine the fragmentation resistance, for example:

- Penetration equations.
- Finite element and fluid-codes.
- Experimental methods.

Ascending the levels of calculation complexity is not simply a matter of increased cost in design, the increase complexity potentially offers the reward of reduced protection requirement for the given threats.

4.5.2 Armour spaced normal to the threat can reduce the total thickness by up to 30 per cent. It may also be effective for bullets provided the gap between plates is greater than 1,0 m.

4.5.3 For Level I fragmentation protection, the equivalent thickness of steel is to be in accordance with Table 2.4.2.

4.5.4 For Level II fragmentation protection, the equivalent thickness of steel is to be determined from Fig. 2.4.2.

Table 2.4.2 Level I fragmentation protection

Material yield strength N/mm ²	Transverse bulkhead or deck thickness mm	Longitudinal bulkhead thickness mm
235	6,5	6,0
355	6,0	5,5
550	5,5	5,0
RHA	5,0	4,5

NOTE
RHA is defined as rolled homogenous armour.

4.5.5 For Level III fragmentation protection, the equivalent thickness of steel is to be determined from Fig. 2.4.3. Protection will normally be required to be provided by several bulkheads or specific armour and the graph can serve only as a guide. The structural protection for this type of threat will generally be specially considered based on the particular weapon characteristics and protection arrangements. It should also be noted that many modern missiles generate controlled fragments which will need special consideration.

4.5.6 The graphs are produced based on a 50 per cent probability of perforation for penetrators perpendicular to the target.

Fig. 2.4.3 Level III fragmentation protection

Section 5

Underwater explosion (shock)

5.1 General

5.1.1 There are two principal loading mechanisms associated with the underwater detonation of a conventional high explosive ordnance:

- shock wave loading;
- bubble flow loading.

5.1.2 The energy released is in general, equally divided between shock wave energy and the energy contained within the superheated high pressure bubble of gaseous explosion products.

5.1.3 The shock wave generated as the detonation wave passes into the water is a highly non-linear pressure pulse which propagates at a speed well in excess of the speed of sound in water (approximately 1500 m/s). However, within a few charge radii of the detonation point, it can be mathematically defined as an acoustic pressure pulse travelling at the speed of sound. Its amplitude falls off inversely with distance and its profile can be characterised by a pulse which has an infinite rise to a peak pressure followed by an exponential decay. The peak value and decay rate at a given field point are given by the similitude equations/coefficients for the explosive material.

5.1.4 In the meantime, the gas bubble begins to expand against the ambient hydrostatic pressure displacing water radially outward as incompressible flow. As it expands, it loses pressure and temperature but the inertia of the outwardly flowing water leads to an overshoot of the equilibrium state so that at maximum bubble radius, the gas pressure is well below the ambient. This initiates the collapse sequence, the gas bubble is recompressed, slowly at first but then rapidly, to a minimum volume by the hydrostatic forces. Because of the generation of a large pressure in the bubble during this stage the bubble begins to expand again and several other cycles may follow. The gas bubble and water interaction can be thought of as a gas spring – mass system. It has a periodicity associated with it but because of energy losses during the process, the spring constant and mass changes over each cycle leading to a change in the periodicity. At each minimum, that is, each recompression, additional pressure pulses are emitted which become weaker with each oscillation as shown in Fig. 2.5.1.

Fig. 2.5.1 Shock wave bubble pulse

5.1.5 The bubble is pulsating in a gravitational field and will have a tendency to migrate to the water/air boundary (the free surface). However, this bodily motion of the bubble centre may be influenced by the proximity of other boundaries such as the seabed or a nearby ship structure. The rate at which a bubble will migrate to the free surface is a function of the buoyancy forces generated when it is at its maxima and of the drag forces it experiences as it moves through the water. Because these drag forces are small when the bubble is at its minima, it tends to migrate vertically upwards more rapidly when at its smallest volume.

5.1.6 The fluid flow generated by the bubble dynamics is an important loading mechanism for a structure, within its sphere of influence. Normally bubble loading can be ignored if the bubble never approaches within a distance of around ten times the maximum bubble radius. The important feature of the bubble loading is its low frequency which is ideally suited to induce ship hull girder flexural motion. This flexural motion is commonly referred to as hull girder whipping. This loading mechanism is dealt with in Section 6. If the bubble is within one bubble radius of the ship structure, it is likely to form a jet which will impact on the structure. This bubble collapse mechanism will cause extensive local damage. It is generally not possible to efficiently design against this loading event for a **NS2** or **NS3** ship. For a **NS1** ship there may be sufficient residual strength to withstand such damage, but the extent of the damage will need to be determined by a specialist calculation and the capability of the hull using a residual strength assessment, see Section 7.

5.1.7 The shock wave loading is greatest at a point on the structure nearest to the detonation event and because of the fall-off with distance and the narrowness of the pulse width, it can be thought of as a local loading event. (In contrast, the bubble induced whipping of the hull girder is considered a global loading event.) The remainder of this Section will focus on the shock loading event only.

5.1.8 There are no simple analytical or numerical techniques for reliably determining the shock resistance of a structure. A measure of the resistance to shock loading can be achieved by good design of the details of the structure to avoid stress concentrations which may lead to rupture. It is also possible to ensure that the plating thickness is matched to the assumed performance of the joints using a simple damage law. The inertial loads on the ship's structure caused by the equipment and its seatings can be determined by time domain analysis.

5.1.9 The shock performance of a ship's hull structure can be assessed solely by conducting shock tests (usually at scale). However, cost usually precludes this approach and a better strategy is to combine tests to determine failure criteria with numerical modelling using Finite Element methods. This complementary experiment/numerical simulation approach reduces the amount of testing required and also provides a method for extrapolating to full scale from scaled experiments.

5.1.10 Generally, for a normal ship structure, the explosion required to cause uncontrollable flooding or total loss of propulsive power is much less than that required to cause failure of a hull designed for normal sea loads. This is outside the scope of the shock notations which address structural aspects only.

5.1.11 Due to operational requirements, some vessel types, such as minesweepers, will be required to resist repeated shock loading at a specified level without degradation of the system or structural performance. Such vessels will also be expected to survive a single attack at a considerably higher shock loading level.

5.2 Threat level determination

5.2.1 The level of threat required is to be specified by the Owner. Three nominal levels of shock performance are presented in Table 2.5.1 together with an appropriate assessment methodology. These levels are denoted by the notations **SH1**, **SH2** or **SH3**, and are valid for a range of threat sizes. The notation that is appropriate for the level specified will be advised on request.

5.2.2 The actual threat level used in the calculation of performance and the areas of the ship to be protected by this design method are to be specified by the Owner and will remain confidential to LR.

5.2.3 Threat levels and shock performance levels are clearly closely related. No matter how well designed and inherently robust a structure and its systems are, there will be a loading level which cannot be sustained. However, there are loading levels which can be sustained with varying degrees of structural and system degradation and these levels are a measure of the shock performance of the vessel. An important consideration is the balance that has to be achieved between system functionality and structural performance.

5.2.4 Two performance bounds can be considered for the shock response of structure:

- The first (lower) of these would be the loading level associated with the onset of material failure (assuming that careful design has ensured that no geometric instability will occur before this state is reached). This level is useful to know as it may have consequences for system functionality. For example, there may be problems associated with equipment mis-alignment because of permanent set of the supporting structure. This Section of the Rules is concerned with establishing this lower bound.
- The second performance bound relates to structural integrity, this being the loading level at which there is no longer sufficient residual hull girder strength to resist normal environmental loading. This is addressed in a separate assessment which is defined by the residual strength notations **RSA1**, **RSA2** or **RSA3**, in Section 7. In conventional naval ships, this upper bound will be significantly higher but there will be little if any system functionality. The structure is considered acceptable when the hull girder is able to withstand reduced sea loads in accordance with Pt 5, Ch 4,5.

Military Load Specification

Section 5

Table 2.5.1 Shock notation requirements

Notation	Basic requirements	Method	Hull structure acceptance criteria
SH1	Detail design	Section 5.4 or testing/modelling	—
	Local strength assessment	Simple empirically based assessment	Minor plate dishing within construction tolerance limits and deformation within system and equipment limits. No global strength assessment
			Some deformation of plating secondary and primary structure and deformation within system and equipment limits
	Global strength assessment	RSA1, RSA2 or RSA3 procedure, see Section 7	Hull girder sufficient for design bending moment with damage defined above
SH2	Detail design	Section 5.5 or testing/modelling	—
	Local strength assessment	Fluid-structure interaction (FSI) modelling using a Finite Element and Boundary Element approach	Minor plate dishing within construction tolerance limits and deformation within system and equipment limits. No global strength assessment
			Some deformation of plating secondary and primary structure and deformation within system and equipment limits
	Global strength assessment	RSA2 or RSA3 procedure, see Section 7	Hull girder sufficient for design bending moment with damage defined above
	Shock trial	Shock trial at lower threat level	No loss of watertight integrity or hull damage
SH3	Detail design	Section 5.6 or testing/modelling	—
	Local strength assessment	Fluid-structure interaction (FSI) modelling using a Finite Element and Volume Element approach (Hydrocode)	Minor plate dishing within construction tolerance limits and deformation within system and equipment limits. No global strength assessment
			Some deformation of plating secondary and primary structure and deformation within system and equipment limits
	Global strength assessment	RSA2 or RSA3 procedure, see Section 7	Hull girder sufficient for design bending moment with damage defined above
	Shock trial	Shock trial at lower threat level	No loss of watertight integrity or hull damage

5.3 Notation assessment levels and methodology

5.3.1 Three levels of notations are given in Table 2.5.1, they represent nominal threats of increasing magnitude. For each level, there are requirements to assess the capability of the structure both locally and globally.

5.3.2 Ships that comply with the requirements of this Section will be eligible for the shock notation **SH1**, **SH2** or **SH3**.

5.3.3 For ships with sea area notations **SA3**, **SA4** and **SAR**, the scantling requirements assigning a shock notation will be specially considered.

5.3.4 For ships where the machinery is in class (**LMC** notation) the requirements of Vol 2, Pt 1, Ch 2,4.11 should also be complied with.

5.3.5 Local assessment is to be carried out using an analysis method appropriate to the threat level as defined in Table 2.5.1. The global assessment need only be performed if significant permanent deformation occurs that could compromise global strength, generally, deflections of plating, secondary or primary structure significantly in excess of normal constructional tolerances. The structure is considered acceptable when:

- Elastic deflections are less than the temporary limits of machinery and systems.
- Permanent deflections are less than the limits of machinery and systems.
- Deflections and strain are less than the limits of the structure or applicability of the analysis method.

Military Load Specification

Volume 1, Part 4, Chapter 2

Section 5

5.3.6 The assessment method or analysis used should be validated against shock trial results and the evidence made available. As an alternative to analysis, full or large-scale shock trials of a section of the ship can be used to validate the proposed design. For novel design arrangements or ship types, a combination of trials and analysis may be necessary, the requirements of which will depend on the threat level and type of structure or ship design.

5.3.7 Global assessment is to be made using the residual strength procedures outlined in Section 7 with the extent of damage being defined from the results of the local strength assessment rather than the damage radii. For the **RSA1** procedure, the damaged structure is to be removed from the analysis. For the **RSA2** or **RSA3** procedure, if the damage is limited, the geometry of the damaged structure can be modelled and if the damage is severe, the structure is to be removed from the analysis. The structure is considered acceptable when the hull girder is able to withstand the design loads as specified in Part 5.

5.3.8 For the notation **SH1** a simple analysis may be performed which allows the motion response at any point in the ship to be determined. This can be derived from experimental results or the Taylor plate equations given below. Once the motion response is known, the damage potential can be determined by comparing the response to an acceptance standard nominated by the Naval Authority.

Maximum velocity

$$V_{\max} = \frac{2P_m}{\rho c} z^u \text{ m/s}$$

Time to maximum velocity

$$t_{\max} = \frac{m}{\rho c} \left(\frac{1}{1-z} \right) \log_e \left(\frac{1}{z} \right) \text{ seconds}$$

where

$$z = \frac{m}{\rho c \theta}$$

$$u = \frac{z}{1-z}$$

θ = decay constant of explosive charge in seconds

P_m = peak pressure in N/mm²

ρ = density of water in kg/m³

c = speed of sound in water in m/s

m = structural mass per unit area in kg/m².

5.3.9 For the notation **SH2**, a more complex assessment method is to be used which accurately models the physics of the rapid, dynamic, fluid structure interaction problem. In general, a finite element model combined with a suitable boundary element from proprietary software may be used.

5.3.10 For complex ships such as multi-hull designs a boundary element approach may not be suitable and a **SH3** analysis would have to be performed. Also, if non-linear fluid behaviour is important (i.e. hull cavitation or bulk cavitation) then a **SH3** analysis would have to be performed unless the finite element or boundary element code used had a suitable cavitation model.

5.3.11 For the notation **SH3**, a volume of fluid is to be modelled rather than a boundary element approach using a suitable hydrocode.

5.3.12 For **SH2** and **SH3** notations, the finite element analysis performed should be in accordance with the requirement of this Section.

5.3.13 The calculations are to be carried out by a competent body with experience in non-linear analysis using a suitable code. Calculations are to be carried out in accordance with established procedures, a copy of which should be made available to LR together with a list of relevant experience when calculations are to be carried out for assignment of the shock notation.

5.3.14 The extent of the analysis model is to be from about 0,35 L_R to 0,55 L_R and encompass at least two major compartments and three watertight bulkheads. It is to be sufficiently large to avoid reflections within the structure from the boundaries, for the threats considered. For the assessment of structural strength, the structure need only be modelled to 1,0 m above the design water line. If the model is to be used to determine equipment response, all structure within that section should be modelled.

5.3.15 The model or versions of the model should encompass representative integral tank arrangements and hull penetrations, stabilisers, hull valves, the failure of which could lead to uncontrollable flooding. Penetrations, the failure of which will not lead to significant flooding or damage need not be considered. The tanks and penetrations need not actually be inside the section under consideration but should be sufficiently similar to represent structure outside the region modelled.

5.3.16 All masses above 100 kg should be included in the model together with an approximation of the mounting system if applicable.

5.3.17 The model should include at least one major machinery item or raft.

5.3.18 The response of hull panels depends upon a large number of variables which are both design and attack geometry dependent. To simplify the task, the following assumptions can be made:

- The charge detonates in the worst location, perpendicular to the structure under consideration.
- All welding is continuous and there are no manufacturing or material defects in the panels.

5.3.19 During the analysis, appropriate elements are to be used to couple the fluid medium and the structural model.

5.3.20 The shock wave can be represented by an exponentially decaying, infinite rise time pressure pulse which sweeps across the structure at the speed of sound.

5.3.21 Non-linear structural modelling can be accommodated in **SH2** and **SH3** analyses. In such cases, stiffeners should be modelled explicitly using shell elements of the appropriate thickness. Stiffener flanges should be modelled with at least two elements per half width or flange.

Military Load Specification

Volume 1, Part 4, Chapter 2

Section 5

5.3.22 Initial imperfections in the hull plating are to be taken into account prior to the dynamic loading analysis.

5.3.23 In addition to analysis requirements, there are detail design requirements for each of the levels, which are based on historical work on shock. Alternatives to the requirements proposed will be considered on the basis of satisfactory analysis or shock trial results.

5.3.24 For the higher levels, **SH2** and **SH3** there is a requirement to carry out shock trials in accordance with established procedures, on the first ship in the class. The magnitude of the test is normally less than the design value for the hull and at a level that is appropriate for the equipment and systems.

5.4 Design guidance for level SH1

5.4.1 The structure should be designed to resist normal environmental loads. The inherent ruggedness of the structure should be sufficient to resist a low level threat.

5.4.2 To achieve an adequate shock performance against a threat of this level, the design emphasis should focus on maintaining a high level of system functionality. This can be achieved by using shock mounts, rather than trying to improve the basic shock resistance of structure.

5.5 Design guidance for level SH2

5.5.1 Tank boundaries are to be of equivalent scantlings to the hull boundaries.

5.5.2 Intermittent welding is not to be used on hull girder structure or tank boundaries below the water line or for 1 metre in way of the deck and shell connections.

5.5.3 Structural discontinuities are to be avoided and in general a minimum taper of 1:4 is to be applied to changes of structural section.

5.5.4 Bar keels are not to be fitted.

5.5.5 Tanks are to be integral with the ship's structure. For free standing tanks greater than 100 litres, calculations demonstrating the capability of the tank and supporting structure are to be submitted.

5.5.6 For structure supporting seatings of equipment above 100 kg, calculations demonstrating the capability of the tank and supporting structure are to be submitted.

5.5.7 Main machinery mounts or raft mounts are to be supported on transverse web frames or floors forming part of the transverse ring structure. See Pt 3, Ch 2,3.2.2.

5.5.8 The size of longitudinal members passing through, or ending on, bulkheads are to be as small as possible, though still complying with the appropriate scantling requirements of Pt 6, Ch 3. Bulkhead stiffeners are to be fitted perpendicular to the shell plating.

5.5.9 Where deep longitudinal members are unavoidable, their connection to the bulkhead will be specially considered.

5.5.10 Bottom longitudinals are to be of a uniform size. Alternate large and small longitudinals are to be avoided as they may lead to high shear forces in the bulkhead.

5.5.11 Access holes in all primary framing members are to be avoided in areas of high shear stress. Where they are essential to the operation of the ship they are to be circular and fitted with appropriate stiffening or compensation.

5.5.12 Frames on the bilge are to be provided with adequate lateral support, consideration should be given to the fitting of a shock stringer.

5.5.13 Lapped connections are not to be used to connect frames to floors.

5.5.14 All bulkhead stiffeners are to end on longitudinals, see Fig. 2.5.2.

5.5.15 In transversely framed ships, bulkhead stiffeners are to be terminated on a shock stiffener welded to the bulkhead, parallel to, and spaced 500 mm from the shell. The bulkhead plating thickness is to be suitably increased in way. The shock stringer and bulkhead plate may be replaced by a web frame of suitable scantlings.

5.5.16 Bulkhead penetrations are to be grouped, away from the side shell and kept above the water line as far as is practicable.

5.5.17 Shell frames and deck beams are to be fitted in such a way as to minimise misalignment. Brackets where fitted are to be radiused and fitted with soft toes.

5.6 Design guidance for level SH3

5.6.1 Pillar bulkheads are to be used below the waterline in place of pillars.

5.6.2 It is recommended that symmetric stiffeners should be fitted to the underwater portion of the shell envelope.

5.6.3 Where a transverse framing system is used, the shock capability of the structure will be specially considered. Calculations supporting the use of particular design details are to be submitted.

5.6.4 All bulkhead stiffeners are to end on longitudinals, see Fig. 2.5.2. An increased thickness margin strake on bulkheads of thickness not less than 80 per cent of the adjacent shell plate thickness, the thickness of the adjacent shell stiffener or 6,5 mm. The margin plate is to have a width not less than 1,5 times the adjacent stiffener spacing or four times the depth of adjacent shell stiffeners.

5.6.5 Shell frames and deck beams are to be fitted in such a way as to minimise misalignment. The frames are to be fitted within a tolerance of $0,3t_{fl}$ median line up to a maximum of 3,0 mm where t_{fl} is the greater thickness of the frames being connected. Where this is not possible, the frame is to be released over $20t_{fl}$ and realigned.

5.6.6 Where brackets are fitted, similar tolerances to 5.6.5 are to be applied subject to a suitable area being provided for weld fillet, see Fig. 2.5.3. Tripping brackets or intercostal stiffeners should be used to stabilise the frame at the bracket toes. Brackets are to be radiused and fitted with soft toes.

Fig. 2.5.3 Bracket connections

Section 6 Whipping

6.1 General

6.1.1 The effects of a non-contact underwater explosion are described in Section 5. Whilst the initial shock wave described in that Section initiates whipping to some degree it is the pulsation of the bubble which leads to the majority of damage to the hull. The initial shock wave causes local hull damage and shock damage to the vessels equipment. In the strain history shown in Fig. 2.6.1 the initial shock wave can be seen to be not just the free response of an elastic system to an impulse as the amplitude continues to increase. There is a typical second kick to the system which stems from the first bubble pulse and which increases the response for several more cycles.

Fig. 2.6.1 Deck strains from hull whipping

6.1.2 The nature and behaviour of the gas bubble are dependent upon the warhead charge size, the explosive composition, the detonation depth and the influence of boundaries such as the sea bed.

6.1.3 The maximum radius of the bubble at the end of the first expansion phase is given by:

$$R_{bub} = 3,417 \left(\frac{W}{H + 10} \right)^{1/3} \text{ m}$$

where

W = bare charge equivalent weight of TNT, in kg

H = depth of the charge at the time of detonation, in metres.

6.1.4 The period of duration of the first bubble pulse is given by:

$$t_{bub} = 2,108 \frac{W^{1/3}}{(H + 10)^{5/6}} \text{ sec}$$

where

W and H are defined in 6.1.3.

6.1.5 Even a relatively modest warhead charge size can produce a bubble which displaces a large mass of water in a very short time frame. The momentum associated with this rapid incompressible flow of a sizeable volume of water constitutes a major loading mechanism for any structure within its sphere of influence.

6.1.6 The effect on the hull is a large amplitude vertical bending and vibration. This first introduces high shear forces at the quarter points which may cause shear wrinkling, this damage will probably not be catastrophic and the hull will go on to develop high compressive forces in the keel. These may cause buckling especially as the bottom structure may already be damaged from the initial shock wave. For extreme cases whipping may lead to the 'back breaking' and total loss of the ship.

6.1.7 An estimate of the hull natural frequency for steel ships is given by:

$$f_{s1} = \frac{215}{L_{OA}} \text{ Hz}$$

where

L_{OA} = the overall length of the ship, in metres.

6.1.8 The risk of a whipping response from a particular threat can be determined using the approximation for the natural frequency and the bubble characteristics of 6.1.4.

6.1.9 If the threat is closer to the hull than $2R_{bub}$ then the bubble loading is to be specially considered.

6.2 Threat level determination

6.2.1 The level to which a ship will be expected to survive an attack scenario that excites hull whipping is to be defined by the Owner and will remain confidential to LR.

6.2.2 The whipping threat level may be defined for a range of warheads detonating at a given stand-off distance and longitudinal (axial) location. The probability of weapon hit locations can be determined from threat analyses which can be used to select the appropriate charge locations for the assessment.

6.2.3 It is also possible to undertake a parametric study to establish the detonation location which will lead to the worst case loading scenario. In this case, all possible hit locations that will induce whipping are assessed and the worst case induced bending moments are compared with an appropriate acceptance criteria. Contours from the keel of maximum threat size to induce failure can also be determined.

6.2.4 Where a shock threat is also being assessed for whipping effects, the warhead stand-off distance from the keel is set to be the same as that which induces the prescribed severity of shock. A series of axial locations are assessed to establish the worst case excitation which is compared to the appropriate acceptance criteria.

6.2.5 The non-dimensional measure of whipping severity, commonly referred to as Whipping Factor, is simply the ratio of maximum induced hull girder bending moment at a section to the critical bending moment for that section. Each threat location assessed will generate a whipping factor which can be assigned to that particular location. In this way a series of iso-Whipping Factor contours can be mapped in the fluid beneath the keel for a particular threat weapon. These contours define hit volume boundaries within which that particular weapon will induce a known level of whipping response.

6.3 Notation assessment levels and methodology

6.3.1 Ships for which a whipping assessment is performed will be eligible for a **WH1**, **WH2** or **WH3** notation as defined in 6.3.4 to 6.3.6.

6.3.2 There are two types of assessment to determine the whipping response of the hull girder:

- Simple 2-D beam model.
- Advanced 3D beam model.

6.3.3 For most ships a simple analysis will be sufficient to determine the whipping capability of the hull girder. An advanced analysis will be required when:

- more detailed information is required on areas of a ship which have been shown by simple analysis to be deficient under whipping loads, for example where there are large structural discontinuities variations;
- the ship design cannot be idealised as a 2-D beam, for example when it has an unusual structural configuration or has low frequency modes of vibration in addition to its vertical flexural modes;
- there is a requirement to predict the extent of plastic deformation in a section;
- the whipping threats are assessed in a shallow water environment.

6.3.4 A **WH1** analysis method uses a 2-D beam representation and a failure level criterion based on the bending moment to induce material yield.

6.3.5 A **WH2** method of analysis uses a 2-D beam representation and a failure level criterion based on the section ultimate bending moments. This will require assessment using ultimate strength calculations at each of the discrete sections of the hull girder beam model.

6.3.6 A **WH3** method of analysis uses a 3-D definition of a section of the hull girder and geometric and material failure criteria implicit in the chosen finite element code.

6.3.7 In each case, it is to be demonstrated that the hull section remains below the defined failure limits for all threat scenarios.

6.3.8 For certain ship types such as minesweepers, it will be necessary to carry out several levels of analysis. An elastic analysis is required for threat levels which are expected to be survived on a regular basis. An elasto-plastic analysis is required at a higher threat level for which the ship is expected to survive.

6.4 Simple 2-D beam model

6.4.1 The modelling of ship interaction with explosion bubbles conveniently breaks down into a set of distinct sub-models.

6.4.2 The hull girder model is usually subdivided into at least twenty equal sections, each of which is assumed to form a 'Timoshenko' beam element. Since the stiffness and mass distributions may vary considerably along the length of a ship, a lumped mass/weightless beam representation is appropriate rather than a consistent mass model. The effect of shear deflection is to be included in the model.

6.4.3 The hull hydrodynamics may be modelled using standard strip theory to represent the effect of the inertia of surrounding water. At any lumped mass representing the hull girder, the added mass of water may be assumed using 'Lewis' forms coefficients. The added mass correction can be assumed to be constant for each mode of vibration.

6.4.4 For the bubble hydrodynamics it is assumed that the flow around the explosion bubble is inviscid and incompressible, that gaseous products obey ideal gas law, and that the bubble itself remains spherical. As a first approximation it may also be assumed that the bubble remains stationary but in general the migration is significant and should be considered. It is also assumed that the bubble motion is not modified by the presence of either the ship or the water surface. The loading model is to account for the dissipation of shock wave energy at the outset of detonation, generally achieved by using a modified initial radius for the bubble calculation.

6.4.5 The interaction hydrodynamics may also be assumed to be incompressible and inviscid consistent with the bubble hydrodynamics. The bubble radial flow may be resolved at the ship axis (the intersection line of the waterplane and the vertical centreline plane) at each lumped mass, into three components. Normally only the vertical z and athwartships y components need be considered as the bubble is assumed to be some distance from the ship. It may also be assumed that at each lumped mass, the transverse velocity around the whole section will be uniform in magnitude and direction.

6.4.6 The force acting on a strip is to account for this motion, plus the uniform pressure gradient assumed in the fluid which induces a buoyancy force proportional to the displaced volume of water. Wave generation and Bernoulli pressure effects may be neglected but the accelerations should account for the free surface reflection of the bubble.

6.4.7 Several assessment codes are available and calculation should be performed by a competent and experienced body with relevant experience and using recognised codes.

6.5 Advanced assessment

6.5.1 Advanced whipping assessments will normally be performed using a hybrid 3-D/2-D structural model for computational efficiency. However, care is to be exercised in the coupling of the 2-D beam elements to the 3-D section to ensure that this artificial boundary condition does not adversely influence the analysis. As an alternative, the ship may be defined as a full 3-D shell model. In which case, it may be possible to invoke symmetry to reduce the problem size and reduce the computational burden.

6.5.2 More than one option exists for modelling the fluid domain. It may be modelled using a boundary element approach and coupled to the structural domain using a Doubly Asymptotic Approximation. Alternatively, a computationally intensive volume fluid element approach employing an Eulerian code may be used. This fluid domain model would have to be coupled to the Lagrangian structural domain through a general or arbitrary coupling scheme. The detonation process and the bubble development would be physically modelled in this approach. A combined approach would entail modelling an island of fluid around the ship, truncated by a boundary element surface on which a bubble loading model would be applied.

6.5.3 For surface ship problems, whichever solution strategy is adopted, the fluid solver must be able to cope with the proximity of the bubble to the free surface and where appropriate reflections from the sea bed. Analysis is to be undertaken by a competent and experienced body using recognised techniques and with the relevant expertise necessary to establish the correct interface strategy between structural and fluid element meshes.

■ Section 7 Residual strength

7.1 General

7.1.1 This Section details the determination of the threat levels and methodology to be adopted in the attainment of an **RSA1**, **RSA2** or **RSA3** notation.

7.2 Threat level determination

7.2.1 The level to which a ship will be expected to structurally survive an attack scenario that results in weapon damage is to be specified by the Owner and will remain confidential to LR.

7.2.2 The threat level may be defined for a range of warheads detonating at given internal positions or UNDEX stand-off distances with defined longitudinal locations. The probability of weapon hit locations can be determined from threat analyses which can be used to select the appropriate charge locations for the assessment.

7.2.3 Generally, fragmentation scenarios are not included in residual strength assessments since the damage is usually localised. However, any significant structural damage resulting from fragmentation (as determined in Ch 2,4) must be considered. Similarly, any damage from an external blast threat weapon must also be included (Ch 2,2). In addition, residual strength calculations must be used in conjunction with level 2 whipping analysis (Ch 2,6).

7.3 Notation assessment levels and methodology

7.3.1 Ships for which a residual strength assessment is carried out will be eligible for a **RSA1**, **RSA2** or **RSA3** notation as defined in 7.3.6 to 7.3.8.

7.3.2 The assessment of the residual strength capability of a ship is to be performed as defined in Pt 6, Ch 4,4.

7.3.3 There are three methods of assessment that may be used to determine the damaged residual strength of the hull girder:

- Simple 2-D cross-section elastic model.
- 2-D ultimate strength model.
- Advanced 3D Finite Element Methods.

7.3.4 In the case of a mine warfare ship or NS3 ships, a 2-D elastic analysis will normally be sufficient. For most other naval ships, a 2-D ultimate strength analysis would normally be required to determine the damaged residual strength at a particular frame location along the hull girder.

7.3.5 An advanced 3D analysis incorporating initial deformations and residual stresses will be required when:

- More detailed information is required throughout one or more compartments along the length of the ship which have been shown by the more simplified 2-D ultimate strength analysis to be inadequate. This may be necessary, for example, where there are large structural discontinuities in hull girder strength.
- The ship design cannot be reduced to a 2-D beam or ultimate strength description, for example, when it has an unusual structural configuration.

7.3.6 A **RSA1** analysis method uses a 2-D elastic cross-section representation and a failure level criterion based on the calculated bending moment being greater than both the design hogging and sagging bending moments at the sections considered to be most critical.

7.3.7 A **RSA2** method of analysis uses a 2-D ultimate strength beam representation and a failure level criterion based on the section ultimate bending moments being satisfactory compared to the design bending moments in both hogging and sagging. This will require assessment using ultimate strength calculations at no less than three damaged positions along the length of the hull.

7.3.8 A **RSA3** method of analysis uses a 3-D definition of a section of the hull girder and relies on geometric and material failure criteria implicit in the chosen finite element code. It could also include coupled Euler-Lagrange formulations to specifically account for internal and external blast effects, UNDEX shock and whipping.

7.3.9 In each case, it is to be demonstrated that the hull girder remains below the defined design hogging and sagging design bending moment failure limits for all prescribed threat scenarios.

7.3.10 For certain ship types, such as mine-sweepers, it will be necessary to carry out several levels of analysis. An elastic analysis should be carried out for threat levels which are expected to be survived on a regular basis and geometric and material non-linear analysis at higher threat levels for which the ship is expected to survive.

7.4 Definition of damage

7.4.1 The damage radius is a measure of the extent of the damage caused by specific above water attack scenarios. This is shown diagrammatically in Fig. 2.7.1, where the assumption of a detonation mid-compartment is shown and the extent of damage is indicated by the extent of the damage radii. Assumptions about position and extent of damage radii are dependent on warhead characteristics. In general, the radii is to be vertically positioned such that it removes the maximum amount of material or has the greatest effect on the sectional inertia.

7.4.2 The damage radii can be determined from:

$$r = f_z W^{1/3} \text{ m}$$

where

$$f_z = \text{scaled distance dependent on ship type}$$

$$W = \text{equivalent weight of TNT, in kg.}$$

7.4.3 Once a damage radius has been determined, the simplest method of accommodating damage is to remove all structure within and touching the damage radii from the residual strength calculation.

7.4.4 For underwater shock (UNDEX), hull plating failure can be derived from angle hull shock factor, as defined in Fig. 2.7.2, exceeding appropriate hull lethality levels. The angled shock factor may be determined from:

$$SF = \frac{W^{0.5}}{R} f(\theta)$$

where

$$W = \text{equivalent charge weight of TNT, in kg}$$

$$R = \text{distance from charge, in metres}$$

$$f(\theta) = \text{threat angle function, see Fig. 2.7.2.}$$

7.4.5 Special consideration will be given to the effects of damage to box type strengthening structure, armour plating, high yield strength materials, double skin hulls and blast strengthened bulkheads.

7.4.6 Generic damage can be generated using pseudo-random hit probability algorithms and repeated application of such algorithms can be used to represent successive weapon hits. Specific damage is difficult to quantify but can be estimated by using damage radii techniques for above water structure and by assuming critical shock factor levels for below water structure.

Section 8

Strengthening requirements for beach landing operations

8.1 General

8.1.1 These requirements are in addition to those of Pt 6, Ch 3 for bottom shell structure. They need only be applied to those areas of the hull at risk from grounding during beach landing operations. These areas are to be agreed between the Owner, Builder and LR at an early stage in the plan approval process. A distinction is made between those areas likely to see impact loads on beaching and those where contact due to grounding will occur after the initial beaching.

8.1.2 The Rules assume that the ships will be brought into shallow water and up to the beach in a controlled manner and that procedures are in place and on board for the operation of these ships. The beach is assumed to be free of rocks of substantially greater projection than the depth of the rubbing strake.

8.1.3 Depending on the operational profile of the ship the minimum bow height given in Pt 3, Ch 2.5.3 will be specially considered.

8.1.4 Loading ramps are to be in accordance with the requirements of Ch 3.5.

8.1.5 Due regard is to be given to forces imposed on the ship and loading ramps by ship motions in shallow water both by impact from surf, the beach, and vehicles used to manoeuvre ships on the beach.

Military Load Specification

Volume 1, Part 4, Chapter 2

Section 8

8.2 Minimum plate thickness

8.2.1 For areas subject to impact and grounding the thickness determined from Pt 6, Ch 3 is to be increased by 20 per cent and is in no case to be taken as less than 7 mm.

8.2.2 For operation in Arctic and Antarctic conditions the material grades are to be in accordance with the requirements of Pt 6, Ch 6,2 Material Class II.

8.3 Bottom stiffening

8.3.1 Secondary stiffening is to be designed in accordance with the requirements of Pt 6, Ch 3 with the modulus increased by 20 per cent. For impact areas the spacing of stiffeners is not to be greater than 500 mm.

8.3.2 Primary structure is to be designed in accordance with the requirements of Pt 6, Ch 3. An additional load case with the forces imposed from global bending and grounding forces uniformly distributed over the bottom in contact with the beach is to be considered. In the absence of specific information, not more than 50 per cent of the bottom structure is to be assumed to be in contact with the beach. The primary structure is also to be capable of supporting the concentrated loads imposed by loading or unloading vehicles.

8.3.3 Primary and secondary structure is to be continuously welded throughout areas subject to grounding.

8.3.4 Lugged connections or fully welded collars of the type shown in Fig. 2.8.1 are to be used. Alternative equivalent arrangements will be individually considered.

Fig. 2.8.1 Collar arrangement

8.3.5 Transverse floors are not to be spaced more than 1,25 m for transversely framed structure or 1,85 m for longitudinal framed structure.

8.3.6 One side girder each side of the centreline is to be fitted in addition to the requirements of Pt 3, Ch 2,3.5 or 3.6.

8.3.7 Transverse floors and girders are to be suitably stiffened with web stiffeners spaced not more than 1,25 m apart.

8.4 Global strength

8.4.1 For ships with $L_R > 50$ m grounding conditions in addition to the loading conditions of Pt 6, Ch 4 are to be assessed. The number and type of loading conditions will be determined by the operational requirements of the ship. In some cases residual strength calculations will be required.

8.4.2 If $L_R > 50$ m and areas of the bottom shell within 0,3 to $0,5L_R$ are at risk from grounding the thickness of the bottom shell and longitudinal structure will be specially considered.

8.5 Rubbing strakes

8.5.1 Rubbing strakes or barwhales are to be fitted to the bottom shell. In longitudinally framed ships they are to be placed directly below longitudinals. Typical arrangements of rubbing strakes are shown in Fig. 2.8.2. Usually they consist of a steel frame welded to the hull supports with a bolted connection to softer material but rubbing strips can be constructed of solid steel sections. They are to be free of projections or other discontinuities which could lead to damage of the shell plating.

Fig. 2.8.2 Rubbing strakes

8.5.2 Rubbing strakes are to be spaced not less than 1,5 m apart. For closer spacing the thickness of the bottom shell will be specially considered.

8.5.3 The rubbing strake housing both internally and externally is to be efficiently coated to prevent corrosion. Where different materials are used the materials are to be selected or insulated to ensure that there is no galvanic corrosion.

8.5.4 Rubbing strakes are to be continuously welded to the hull. Butts between sections of rubbing strake are to be butt welded together before being welded to the hull. Where this is not possible, ceramic rather than copper backing strips are to be used.

8.5.5 Rubbing strakes are to be of the same grade of steel as the shell plate to which they are attached.

8.5.6 The ends of rubbing strakes are to be tapered at an angle of not less than 1 in 3 with no discontinuities in the welding in this region. Where not supported by internal longitudinals, the ends of strakes are to be arranged to pass 30 to 50 mm over the end of transverse frames or floors.

8.5.7 Due consideration is to be given to the depth of the rubbing strakes with regard to the nature of the beach. In no case are they to be less than 100 mm projection.

Section 9 Military installation and operational loads

9.1 Weapon recoil, blast and efflux loads

9.1.1 Loads resulting from weapon launch may include recoil effects, blast and missile efflux pressures, and in general will be impulsive. These three types of load are estimated in different ways and will be covered in turn.

9.1.2 Gun and mortar recoil loads will generally be obtained from the manufacturer's documentation. If the natural frequency of the supporting structure is more than four times the firing rate and at least 50 per cent higher than the frequency derived from the time to maximum force, then a dynamic load factor of 1,6 may be used for a first estimate. If the gun is mounted immediately above an effective bulkhead then the structural resonant frequencies will be much higher and a dynamic load factor of 1,2 may be assumed. The stiffness of the supporting structure should be adequate for the loads imposed and in accordance with the manufacturer's recommendations.

9.1.3 The assessment of structure is to be made at the azimuth and elevation of the gun that produces the maximum demands on each component of the support structure. These will usually be ahead and abeam and at 0° and maximum elevation, although additional calculations should be made at the 45° positions vertically and horizontally against the resolved in-plane and normal elements of the load which occur simultaneously.

9.1.4 The load on the structure due to gun blast is in the form of a short-lived transient overpressure; values of this overpressure should be available in the manufacturer's documentation for the weapon as curves of pressure against distance from the gun muzzle. The pressure will act only for a time of the order of 10 ms so the structure, with a much higher natural response period, is unable to react to the full overpressure and it is sufficient to design to an equivalent static pressure using the dynamic load factors specified in Pt 6, Ch 2.5. Guns with a high rate of fire, typically greater than 30 rounds per minute, may induce a forced vibration and will be specially considered.

9.1.5 Should blast pressure curves not be available then a spherical approximation to the equivalent static design pressure P_g can be found from the following equation for ϕ_m values in the range 80 mm to 120 mm

$$P_g = 2 (1 + \cos \theta)^2 \left(\frac{\phi_m}{x} \right)^{1,5} \times 10^3 \text{ kN/m}^2$$

where

ϕ_m = the bore of the gun, in mm

x = the distance from the muzzle of a point at which the pressure is required, in mm

θ = the angle to the centre-line of the barrel

As shown in Fig. 2.9.1.

Fig. 2.9.1 Gun blast geometry

9.1.6 Missile efflux blast loading can be predicted by considering the rate of change of momentum of the efflux where it strikes the structure under consideration. However, when calculating the equivalent design load allowance must also be made for the dynamic response of the structure. For practical purposes therefore it is sufficient to design for the thrust averaged over a cone of semi-angle β and the resultant equivalent static pressure P_m may be found from

$$P_m = f_{DLF} \left(\frac{T_m}{A} \right) \left(\frac{\sin \alpha}{\sin \alpha + \tan \beta \cos \alpha} \right) \text{ kN/m}^2$$

where

f_{DLF} = a dynamic load factor relating to variations in the efflux pressure and can be taken as 1,5

T_m = thrust, in kN

α = angle ($25^\circ < \alpha < 90^\circ$) to the structure, in degrees

A = projected area of cone, in m^2

β = the efflux cone semi-angle in degrees and can be taken as 3°

As shown in Fig. 2.9.2.

9.1.7 Missile efflux will generally be at high temperature and may contain particulates. Protection is to be provided for ship structure and equipment upon which the efflux may impinge during launch.

9.2 Replenishment at sea loads

9.2.1 The loads imposed on the ship's structure will depend on the operation of the vessel during RAS operation and what weight of stores is to be transferred.

9.2.2 Guidance on representative arrangements is presented in Fig. 2.9.3. It is the responsibility of the Owner to define the design load values. The line of action of the forces is to be considered for all possible angles that might occur during replenishment operations.

9.2.3 In the absence of any specific information the RAS jackstay point is to be designed for 160 kN at 20° either side of the vertical and 20° either side of the horizontal. The outhaul securing point are to be designed for 40 kN 20° either side of the vertical and 0° to 45° below the horizontal.

Military Load Specification

Volume 1, Part 4, Chapter 2

Sections 9 & 10

9.2.4 The structure is to be designed such that the stress from RAS operations in no part of the structure exceeds 70 per cent of the yield stress of the material under test conditions and 35 per cent of the yield stress of the material under normal working conditions.

9.2.5 For structure supporting RAS equipment, materials are to be in accordance with Table 6.2.1 in Pt 6, Ch 6.

9.2.6 Where tripods, gantries or masts are used for RAS operations the buckling strength of members in compression is to be specially considered.

9.2.7 A clear area is to be provided for RAS operations and the landing area for RAS operation is to be suitably strengthened for impact loading and concentrated equipment loads.

9.2.8 The design load used in the determination of scantlings for tanks used in RAS operation are to take due account of the maximum loads experienced in service. See Pt 5, Ch 3,5.

■ Section 10 Aircraft operations

10.1 General

10.1.1 The landing area may be located on an appropriate area of the weather deck or on a platform specifically designed for this purpose and permanently connected to the ship structure. All ships operating aircraft are to comply with the requirements of this Section and will be assigned an **AIR** notation.

10.1.2 Attention is drawn to the requirements of National and other Authorities concerning the construction of helicopter landing platforms and the operation of helicopters as they affect the ship. Consideration is to be given to air flow over the landing area and the impingement of hot exhaust gases on equipment in the flight path.

10.1.3 Where the landing area forms part of a weather or erection deck, the scantlings are to be not less than those required for decks in the same position.

10.1.4 Equipment and vehicles using the landing area will also need to be assessed to identify the most onerous load in accordance with Pt 5, Ch 3.

10.1.5 Special consideration is to be given to the insulation standard if the space below the aircraft deck is a high fire-risk space.

10.1.6 These Rules assume that the aircraft are fitted with oil/gas dampers and pneumatic types, different under carriage arrangements will be specially considered.

10.1.7 Suitable arrangements are to be made to minimise the risk of personnel or machinery sliding off the landing area. A non-slip surface and anchoring devices, and in the case of independent platforms, safety nets, are to be provided.

10.1.8 Suitable fire fighting equipment and services should be arranged on the landing deck, manoeuvring and parking areas as defined by the Naval Authority. Arrangements are to be made for drainage of the platform, including drainage of spilt fuel. Fire protection should also be arranged between spaces containing aircraft and other areas of the ship. Special consideration should be given to aircraft handling arrangements and the possible passage of spilt fuel.

10.2 Definitions

10.2.1 OLEO load is defined as the load which will cause the damper and tyre combination to reach the end of their travel. OLEO loads should not generally be used to determine loads from the undercarriage on the flight deck. OLEO loads do not always reflect the loads that can be imposed by an aircraft landing on a ship. Loads should be derived using the vertical velocities specified in Table 2.10.3. The ratios of OLEO loads may be used to determine the dynamic distribution of load from the undercarriage.

10.2.2 The all up weight (AUW) is the maximum that will be encountered for the specific application under consideration it includes the maximum weight of aircraft, personnel, fuel and payload:

- For helicopters the AUW is to be taken as the maximum weight of aircraft, personnel, fuel and payload at all times.
- For manoeuvring of fixed wing aircraft the AUW is to be taken as the maximum weight of aircraft, personnel, fuel and payload.
- For take-off of fixed wing aircraft the fuel weight is to be the maximum less the fuel required to transit to the take off position.
- For landing of fixed wing aircraft the AUW is to be as above except that the fuel weight is to be the maximum less that consumed by the shortest possible flight.

10.3 Documentation

10.3.1 Plans are to be submitted showing the proposed scantlings and arrangements of the structure. The type, size and weight of aircraft to be used are also to be indicated.

10.3.2 Details of arrangements for securing the aircraft to the deck are to be submitted for approval.

10.3.3 A landing guide should be provided as part of the ships' documentation. This is to contain all the relevant design information on the aircraft for the ship, identification of landing parking and manoeuvring areas, tie down arrangements, weights and a summary of the design calculations. It is also to provide guidance on the suitability of the landing areas for other aircraft. The information is to be presented in a graphical form similar to that shown in Fig. 2.10.1. Unrestricted landings are aircraft weights which can occur up to the design sea state. Restricted landing with weights higher

Military Load Specification

Volume 1, Part 4, Chapter 2

Section 10

than the design can occur but in a reduced sea state and are to be indicated on the diagram. Prohibited landings are aircraft weights that may not take place in any sea state. Different diagrams will be required for twin and single rotor helicopters and for aircraft as appropriate.

10.4 Flight deck arrangements

10.4.1 The landing area is to be sufficiently large to allow for the landing and manoeuvring of the aircraft, and is to be approached by a clear landing and take-off sector complying in extent with any applicable regulations.

10.4.2 Normally, for maximum flexibility in helicopter operations, the landing area is to be taken as a square not less than 1,25 times the rotor diameter. Where the operation of helicopters is restricted to known helicopter types, the areas of deck structure to be assessed for the landing condition are to be taken as squares not less than two times the maximum wheel strut spacing. The squares are to be centred on all the normal landing points, at all specified landing orientations, for all helicopters. For fixed wing aircraft the area to be considered will be determined by the operational requirements of the vessel. The landing area is to be clearly identified.

10.4.3 The takeoff and landing area are generally to be free of projections above the level of the deck. Projections above 25 mm may only be permitted where allowed by the aircraft undercarriage design standard. Projections outside the landing and takeoff areas are to be kept to a minimum such that they do not hinder aircraft manoeuvring operations.

10.4.4 The structure is to be designed to accommodate the largest aircraft type which it is intended to use. It is advised that an allowance be made for future growth of the helicopter weight such that future operations are not restricted to lower sea states.

10.4.5 Engine uptake arrangements are to be sited such that exhaust gases cannot as far as practicable be drawn directly into aircraft engine intakes during aircraft take-off or landing operations under anticipated operating conditions that include ship speed, ship motion and wind direction.

10.5 Loading

10.5.1 The load cases to be applied to all parts of the structure are defined in Table 2.10.6. in which:

- $f = 1,15$ for landing decks over magazines or permanently manned spaces, e.g deckhouses, bridges, control rooms, etc.
- $= 1,0$ elsewhere
- λ = reaction factor for the aircraft considered
- W_{auw} = the maximum all up weight of the aircraft, in kN
- W_{ty} = landing or static load, on the tyre print, in kN; with the centre of gravity in a position that causes the highest load. In the absence of specific aircraft manufacturers' information on the static or dynamic distribution of load, W_{ty} is to be taken as W_{auw} divided equally between the two main undercarriages ignoring the nose or tail wheel. For helicopters with twin main rotors, W_{ty} is to be taken as W_{auw} distributed between all main undercarriages in accordance with the static load distribution.

10.5.2 The reaction factor, λ , may be determined from Table 2.10.1 where manufacturers' information is not available. Otherwise the information in 10.6 or 10.7 as appropriate may be used to estimate λ .

Table 2.10.1 Landing reaction factor

Aircraft type	λ
Helicopters	2,5
VSTOL aircraft	3,5
Fixed wing aircraft	5
NOTE Reaction factors are derived from the average values for marinised versions of aircraft.	

10.5.3 The reaction factor for helicopters using recovery systems will be specially considered.

Military Load Specification

Volume 1, Part 4, Chapter 2

Section 10

10.6 Determination of λ for fixed wing aircraft

10.6.1 The reaction factor can be calculated by simulation, testing or estimated from the following formulae:

$$\lambda = \frac{V_L^2}{2g(\eta_T \delta_T + \eta_S \delta_S)}$$

where

- λ = reaction factor
- δ_S, δ_T = deflection of the shock absorber or tyre, in metres
- V_L = vertical landing velocity including ship motions, in m/s
- η_T = efficiency of the tyre typically assumed to be 0,47.
- η_S = efficiency of the shock absorber, see Table 2.10.2.

Table 2.10.2 Shock absorber efficiency

	Steel spring	Rubber	Air	Liquid spring	OLEO
η	0,5	0,6	0,48	0,76	0,8

10.6.2 The vertical velocity is the maximum landing velocity derived from trials or simulation and is to include the effects of ship motion. In no case is it to be taken less than 6 m/s. If landing operations are to be carried out in sea states greater than six then the minimum vertical velocity will be further considered.

10.7 Determination of λ for helicopters

10.7.1 The reaction factor can be calculated by simulation, testing or estimated from the following formulae:

$$\lambda = \frac{V_L^2}{2g(\eta_T \delta_T + \eta_S \delta_S)} + \frac{(1 - f_L)(\delta_T + \delta_S)}{\eta_T \delta_T + \eta_S \delta_S}$$

where

- $\lambda, \delta_S, \delta_T, V_L, \eta_T, \eta_S$ are defined in 10.6.
- f_L = the percentage of lift carried by the rotors at the time of landing typically 66 per cent.

10.7.2 The vertical velocity is the maximum landing velocity derived from ship trials or simulation and is to include the effects of ship motion. In no case is it to be taken less than 3,72 m/s. If landing operations are to be carried out in sea states greater than six then the minimum vertical velocity will be further considered.

10.7.3 For ships where helicopter operations are restricted to sea states lower than six the vertical velocities defined in Table 2.10.3 can be used.

Table 2.10.3 Vertical velocity

Sea state	Vertical velocity
6	3,72
5	3,35
4	2,97
3	2,60
2	2,23

10.7.4 Using a vertical velocity lower than the design given in this Section, for example a land based helicopter, will result in higher probabilities of exceedance. The derivation of vertical velocity is such that it includes the effects of ship motions and pilot action and is independent of the design vertical velocity of the undercarriage.

10.7.5 Information on the probability of encountering a particular sea state for a sea area can be found in Pt 5, Ch 2,2.

10.7.6 For helicopters with skids, determination of the reaction factor will be specially considered.

10.8 Deck plating design

10.8.1 The deck plate thickness, t_p , within the landing area is to be not less than:

$$t_p = \frac{\alpha s}{1000 \sqrt{k_s}} - t_c \text{ mm}$$

where

- α = thickness coefficient obtained from Fig. 3.2.1 in Ch 3,2 using a value of β given by
- β = tyre print coefficient used in Fig. 3.2.1 in Ch 3,2
- $\beta = \log_{10} \left(\frac{0,6 F_{typ} \phi_1 \phi_2 \phi_3 \gamma k_s^2}{9,81 s^2} \times 10^7 \right)$
- k_s = higher tensile steel factor defined in Pt 6, Ch 5
- s = stiffener spacing, in mm
- F_{typ} = tyre force, in kN from Table 2.10.6
- λ = reaction factor for the aircraft considered, see 10.5
- γ = a location factor given in Table 2.10.4
- ϕ_1, ϕ_2, ϕ_3 = are patch load correction factors determined from Table 2.10.5
- t_c = permanent set correction in mm, see 10.8.2
- a, s = the panel dimensions in mm, see Fig. 2.10.2
- u, v = the patch dimensions in mm, see Fig. 2.10.2.

Table 2.10.4 Location factor, γ

Location	γ
On decks forming part of the hull girder (a) within $0,4L_R$ amidships	1,18
(b) at the FP or AP	1,0 Values for intermediate locations are to be determined by interpolation
Elsewhere	1,0

Military Load Specification

Volume 1, Part 4, Chapter 2

Section 10

Table 2.10.5 Patch load corrections ϕ_1, ϕ_2, ϕ_3

Factor	Condition
$\phi_1 = \frac{2v_1 + 1,1s}{u_1 + 1,1s}$	$v_1 = v$, but $\leq s$ $u_1 = u$, but $\leq a$
$\phi_2 = 1,0$ $= \frac{1}{1,3 - 0,3(a-u)/s}$ $= 0,77 a/u$	for $u \leq (a-s)$ for $a \geq u > (a-s)$ for $u > a$
$\phi_3 = 1,0$ $= 0,6 (s/v) + 0,4$ $= 1,2 (s/v)$	for $v < s$ for $1,5 > (v/s) > 1,0$ for $(v/s) \geq 1,5$

**Fig. 2.10.2 Tyre patch dimensions**

10.8.2 The permanent deflection correction, t_c , is a plating thickness reduction which can be applied if aircraft manoeuvring, take off and deck equipment operations allow some permanent set to occur

$$t_c = 0,001C s^n \text{ mm}$$

where

$$C = 0,00071 \text{ and } n = 2,2 \text{ for moderate deformations}$$

$$C = 0,0154 \text{ and } n = 1,85 \text{ for large deformations.}$$

10.8.3 Moderate deformations are defined as those that will restrict manual manoeuvring of the aircraft. They will typically be 1,5 times the deflection expected from normal ship construction.

10.8.4 Large deformations are defined as those that will restrict operations to aircraft landing only with no wheeled vehicle operations they will typically be 2,5 times the deflections expected from normal ship construction.

10.8.5 If permanent deformation of the landing area plating is to be allowed then the plating must also be assessed for normal operations with $t_c = 0,0$ mm.

10.8.6 The permanent deflection correction is not to be applied to landing areas within $0,3L_R$ to $0,7L_R$ and other areas where there are significant in-plane stresses in the plate. Also the correction is not to be applied to areas where deflections could cause operational restrictions, for example the use of forklift trucks or rolling take off.

10.8.7 The static tyre print dimensions at W_{auw} specified by the manufacturer are to be used for the calculation. Where these are unknown it may be assumed that the print area is 200 mm x 300 mm and this assumption is to be indicated on the submitted plan.

Table 2.10.6 Design load cases for primary and secondary deck stiffening and supporting structure

Condition	Loading					
	Plate, F_{typ} kN	Stiffening			Support structure	
		P_{tyw} kN/m ²	Point loads, F_{tys} kN	Self weight, F_{tym} kN	Vertical kN	Horizontal kN
Emergency landing	$\lambda f W_{ty}$	0,2	$DLF \lambda f W_{ty}$	$(1 + a_z) W_s$	Self weight W_{pl} plus landing loads from all wheels	$0,5 W_{auw}$ $0,5 W_{auw} + 0,5 W_{pl}$
Normal landing	$0,6 \lambda W_{ty}$	0,5	$0,6 DLF \lambda W_{ty}$	$(1 + a_z) W_s$		
Take off (fixed wing)	$2,65 W_{ty}$	0,5	$2,65 W_{ty}$	$(1 + a_z) W_s$		
Manoeuvring internal	$1,6 W_{ty}$	–	$1,6 W_{ty}$	$(1 + a_z) W_s$		
Manoeuvring external	$1,75 W_{ty}$	0,5	$1,75 W_{ty}$	$(1 + a_z) W_s$		
Parking internal	$(1 + 0,6a_z) W_{ty}$	–	$(1 + 0,6a_z) W_{ty}$	$(1 + a_z) W_s$		
Parking external	$1,1(1 + 0,6a_z) W_{ty}$	2	$1,1(1 + 0,6a_z) W_{ty}$	$(1 + a_z) W_s$

NOTES						
1. For the design of the supporting structure for helicopter platforms applicable self weight and horizontal loads are to be added to the landing area loads.						
2. The helicopter is to be so positioned as to produce the most severe loading condition for each structural member under consideration.						
3. Stiffening members may have more than one point load acting at one time.						

10.8.8 Twin wheels are to be combined to form a single patch as shown in Fig. 2.10.2.

10.8.9 For helicopters fitted with landing gear consisting of skids, the print dimensions specified by the manufacturer are to be used. Where these are unknown it may be assumed that the print consists of a 300 mm line load at each end of each skid, when applying Fig. 3.2.1 in Ch 3,2.

10.8.10 For decks fitted with sheathing greater than 25 mm a reduced plate thickness from that given in 10.8.1 may be specially considered.

10.8.11 For steel decks in frequent use and where no suitable protective sheathing or coating is used the thickness of the plating is to be increased by 1,5 mm to allow for wear and corrosion.

10.9 Deck stiffening design

10.9.1 The aircraft deck stiffening is to be designed for the load cases given in Table 2.10.6 with the aircraft being positioned so as to produce the most severe loading condition for each structural member under consideration. All possible positions and orientations are to be considered that can occur during aircraft operations.

10.9.2 The minimum requirements for section modulus, inertia and web area of secondary stiffeners are to be in accordance with the requirements of Table 3.2.3 in Pt 4, Ch 3, using the load cases defined in Table 2.10.6.

10.9.3 For primary stiffening, and where a grillage arrangement is adopted, it is recommended that direct calculation procedures are used to determine the scantling requirements in association with the limiting permissible stress criteria given in Table 5.3.2 in Pt 6, Ch 5. The calculation is to be submitted for consideration.

10.9.4 Where continuous secondary stiffeners pass through the webs of primary members, they are to be fully collared or lugged in way. The shear stresses at the connections are to be in compliance with Pt 6, Ch 5.

10.10 Parking and manoeuvring areas

10.10.1 For areas designed for parking and manoeuvring of aircraft the maximum take off weight of the aircraft is to be used with the maximum fuel and payload.

10.10.2 For areas where only manoeuvring occurs and parking is restricted to designated and clearly marked areas then the scantlings of structure are to be calculated in accordance with 10.8 and 10.9 using the manoeuvring and parking loads given in Table 2.10.6 as appropriate. If parking areas are not clearly marked then the parking loads in Table 2.10.6 are to be applied to all areas of aircraft operation outside the landing area. W_{ty} may be determined from the static distribution of the load or in the absence of specific information shared equally between the tyres. The loads for non-pneumatic tyres will be specially considered.

10.10.3 Parking areas may not be taken less than two frame spaces or the tyre width plus 500 mm whichever is the greater. Consideration should be given to the use of removable lagging around these areas and at the adjacent beam bulkhead connection.

10.10.4 Additional forces from tie down arrangements on the structure need only be considered if the tensioning force applied exceeds that imposed by the forces from ship motions as defined in 10.14.

10.10.5 Decks subjected to a combination of parking and significant in-plane stresses will be specially considered.

10.11 Assisted take off

10.11.1 Where the aircraft jet is not parallel to the deck at the moment of launch or jet blast deflectors are used the structure is to be capable of withstanding the thermal loads imposed on the deck.

10.11.2 The structure of ramps used to assist take off are to be specially considered.

10.11.3 Structure surrounding catapults are to be effectively supported and designed for the maximum forces imposed by the launch system using the stress criteria given in Table 5.3.2 in Pt 6, Ch 5.

10.12 Arrested landing

10.12.1 Structure surrounding arresting gear is to be effectively supported and designed for the maximum forces imposed by the arrested aircraft using the stress criteria given in Table 5.3.2 in Pt 6, Ch 5.

10.13 Vertical recovery

10.13.1 The structure in way of the landing area and approach path is to be capable of withstanding the thermal loads imposed by hot exhaust gases.

10.14 Tie down forces

10.14.1 The force to be used in assessing the tie down points is to be determined from the calculations for the securing arrangements, in accordance with LR's LAME Code.

Special Features

Volume 1, Part 4, Chapter 3

Sections 1 & 2

Section

- 1 **General**
- 2 **Vehicle decks and fixed ramps**
- 3 **Bow doors**
- 4 **Side, stern doors and other shell openings**
- 5 **Movable decks, lifts, internal and external ramps**

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter are applicable to mono-hull and multi-hull ships of steel construction as defined in Pt 1, Ch 1,1.

1.2 Symbols and definitions

1.2.1 The symbols and definitions used in this Chapter are defined below and in the appropriate Section:

- s = stiffener spacing, in mm
- k_s = higher tensile steel factor, see Pt 6, Ch 5,3.1.1.

■ Section 2 Vehicle decks and fixed ramps

2.1 General

2.1.1 These requirements are applicable to longitudinally or transversely framed ships intended for the carriage of tracked vehicles, wheeled vehicles, or where wheeled vehicles are to be used for cargo handling.

2.1.2 The deck and supporting structure are to be designed on the basis of the maximum loading to which they may be subjected in service. Where applicable, the hatch covers are to be similarly designed. In no case, however, are the scantlings to be less than would be required for a weather or cargo deck, or hatch cover, as applicable.

2.1.3 Details of the deck loading resulting from the proposed stowage or operation of vehicles are to be supplied by the Builder. These details are to include axle and wheel spacing, the wheel load, type of tyre and tyre print dimensions for the vehicles. The vehicle types and wheel loads for which the vehicle decks, including hatch covers where applicable, have been approved are to be included in the ship's documentation and contained in a notice displayed on each deck. For wheeled vehicles, the wheel loading is to be taken as not less than 3,0 kN.

2.1.4 The scantling requirements are based on structural strength and limitations on stress and deflection, guidance for wear and tear allowances is given in 2.3. Local reinforcement is to be fitted as necessary, particularly in way of vehicle lanes and embarked personnel routes.

2.1.5 The webs of vehicle deck stiffening members are in no cases to be scalloped.

2.1.6 If wheeled vehicles are to be used on insulated decks or tanks tops, consideration will be given to the permissible loading in association with the insulation arrangements and the plating thickness.

2.1.7 Suitable fire fighting equipment and services should be provided in the vehicle space. Arrangements should be made for ventilation and drainage of spilt fuel.

2.2 Definitions

2.2.1 **Load area.** The load area is defined as the footprint area of an individual wheel or the area enclosing a group of wheels when the distance between footprints is less than the smaller dimension of the individual prints.

2.3 Deck plating

2.3.1 The thickness, t_p , of vehicle deck plating is to be taken as not less than:

$$t_p = \frac{\alpha s}{1000\sqrt{k_s}} \text{ mm}$$

where

- α = thickness coefficient obtained from Fig. 3.2.1 using a value of β given by
- β = tyre print coefficient used in Fig. 3.2.1
- $= \log_{10} \left(\frac{F_{typ} k_s^2}{9,81s^2} \times 10^7 \right)$

s = secondary stiffener spacing, in mm

F_{typ} = corrected patch load for plating, in kN obtained from Table 3.2.1, see also Fig. 3.2.1 and Table 3.2.2
 s and k_s are as defined in 1.2.

2.3.2 Where transversely framed decks contribute to the hull girder strength or where secondary stiffening is fitted perpendicular to the direction of vehicle lanes, the thickness, t_p , derived from 2.3.1 is to be increased by 1,0 mm.

2.3.3 In the absence of a specific requirement the thickness, t_p , derived from 2.3.1 is to be increased by a wear and wastage allowance of 1,5 mm for strength decks, weather decks, tank tops and inner bottom or 0,75 mm elsewhere.

Table 3.2.1 Deck plate thickness calculation

Symbols	Expression
$a, s, u,$ and v as defined in Fig. 3.2.1 n = tyre correction factor as detailed in Table 3.2.2 F_{typ} = corrected patch load for plating, in kN λ = dynamic magnification factor W_{ty} = load, in kN, on the tyre print. For closely spaced wheels the area shown in Fig. 2.10.2 may be taken as the combined print ϕ_1 = patch aspect ratio correction factor ϕ_2 = panel aspect ratio correction factor ϕ_3 = wide patch load factor	$F_{typ} = \phi_1 \phi_2 \phi_3 \lambda W_{ty}$
	$\phi_1 = \frac{2v_1 + 1,1s}{u_1 + 1,1s}$ <div style="display: flex; justify-content: space-between;"> <div>$v_1 = v, \text{ but } \leq s$</div> <div>$u_1 = v, \text{ but } \leq a$</div> </div>
	$\phi_2 = 1,0$ for $u \leq (a - s)$ $= \frac{1}{1,3 - \frac{0,3}{s}(a - u)}$ for $a \geq u > (a - s)$ $= 0,77 \frac{a}{u}$ for $u > a$
	$\phi_3 = 1,0$ for $v < s$ $= 0,6 (s/v) + 0,4$ for $1,5 > (v/s) > 1,0$ $= 1,2 (s/v)$ for $(v/s) \geq 1,5$
	$\lambda = 1,25$ for harbour conditions $= (1 + 0,7n)$ for sea going conditions

Special Features

Number of wheels in idealised patch	Pneumatic tyres correction factor, n	Solid rubber tyres correction factor, n
1	0,6	0,8
2 or more	0,75	0,9

2.4 Secondary stiffening

2.4.1 The scantlings of vehicle deck stiffeners are to satisfy the most severe arrangement of print wheel loads.

2.4.2 The minimum requirements for section modulus, inertia and web area of vehicle deck secondary stiffeners subject to wheel loading are to be calculated in accordance with Table 3.2.3 using the loads defined in Table 3.2.4.

2.4.3 When two or more load areas are located simultaneously on the same stiffener span, the scantling requirements are to be specially considered on the basis of direct calculation.

2.5 Primary stiffening

2.5.1 Generally the scantlings of vehicle deck primary girders and transverse web frames are to be determined on the basis of direct calculation in association with the loads defined in Table 3.2.4 and the limiting permissible stresses and deflection criteria contained in Pt 6, Ch 5.

Table 3.2.4 Design load cases for primary and secondary stiffening and supporting structure

Condition	Loading		
	Stiffening		
	UDL P_{tyw} kN/m ²	Point loads, F_{tys} kN	Self weight, F_{tym} kN
Manoeuvring internal	—	$1,6W_{ty}$	$(1 + a_z) W_s$
Manoeuvring external	0,5	$1,75W_{ty}$	$(1 + a_z) W_s$
Parking internal	—	$(1 + n a_z) W_{ty}$	$(1 + a_z) W_s$
Parking external	2	$1,1 (1 + n a_z) W_{ty}$	$(1 + a_z) W_s$
Symbols			
W_{ty} = maximum effective load per wheel or group of wheels W_s = structural weight of stiffener and supported structure, in kN UDL = uniformly distributed load over entire vehicle area, kN/m ² n = tyre correction factor in Table 3,2,2 a_z is defined in Pt 5, Ch 3,2			
NOTES			
1. For the design of the supporting structure for vehicle decks, the applicable self weight and horizontal loads are to be added to the parking area loads. 2. The vehicles are to be positioned so as to produce the most severe loading condition for each structural member under consideration. 3. Stiffening members may have more than one point load acting at any time.			

Table 3.2.3 Secondary stiffener requirements

Scantling requirement	Load case	
	$d \leq l$	$d > l$
Section modulus (Z) (cm ³)	$Z = \left(\frac{k_w F_{tys} (3l^2 - d^2)}{24l} + \frac{P_{tyw} s l^2}{10} + \frac{F_{tym} l}{10} \right) \frac{10^3}{f_\sigma \sigma_o}$	$Z = \left(\frac{k_w F_{tys} l^2}{10d} + \frac{P_{tyw} s l^2}{10} + \frac{F_{tym} l}{10} \right) \frac{10^3}{f_\sigma \sigma_o}$
Inertia (I) (cm ⁴)	$I = \left(\frac{k_w F_{tys} (2l^3 - 2d^2 l + d^3)}{384l} + \frac{P_{tyw} s l^3}{288} + \frac{F_{tym} l^2}{288} \right) \frac{10^5}{f_\delta E}$	$I = \left(\frac{k_w F_{tys} l^3}{384d} + \frac{P_{tyw} s l^3}{288} + \frac{F_{tym} l^2}{288} \right) \frac{10^5}{f_\delta E}$
Web area (A_w) (cm ²)	$A_w = \left(\frac{k_w F_{tys} (m^3 - 2m^2 + 2)}{2} + \frac{P_{tyw} s l}{2} + \frac{F_{tym}}{2} \right) \frac{10}{f_t \tau_o}$ where $m = d/l$	$A_w = \left(\frac{k_w F_{tys} l}{2d} + \frac{P_{tyw} s l}{2} + \frac{F_{tym}}{2} \right) \frac{10}{f_t \tau_o}$
Symbols		
l = overall secondary stiffener length, in metres s = stiffener spacing, in metres d = dimension of load area parallel to stiffener axis, in metres E = Youngs Modulus of elasticity of material, in N/mm ² w = dimension of load area perpendicular to stiffener axis, in metres k_w = lateral loading factor = 1 for $w \leq s$ = s/w for $w > s$		
F_{tys} = point load given in Table 3.2.4, in kN F_{tym} = self weight load given in Table 3.2.4, in kN P_{tyw} = weather deck load given in Table 3.2.4, in kN/m ² f_σ, f_δ, f_t are the structural design factors given in Pt 6, Ch 5 σ_o = specified minimum yield strength of the material, in N/mm ² τ_o = shear strength of the material, in N/mm ² = $\frac{\sigma_o}{\sqrt{3}}$		

2.6 Securing arrangements

2.6.1 The strength and stiffness of the holding down arrangements and supporting structure are to be in accordance with Ch 1,5.2.

2.6.2 Deck fittings in way of vehicle lanes are to be recessed.

2.6.3 The vehicle deck structure is to be of adequate strength for the upward forces imposed at fixed securing points. Local reinforcement is to be fitted as necessary.

2.7 Access

2.7.1 Bow doors are to comply with the requirements of Section 4.

2.7.2 Where access to the vehicle deck is provided by side and stern doors, the doors are to have scantlings equivalent to the structure in which they are fitted, see also Pt 3, Ch 4,4.

2.7.3 Doors providing access between vehicle decks and accommodation spaces are to be gastight, have scantlings equivalent to the surrounding structure and where applicable are to comply with the fire requirements as defined by the Naval Authority.

2.8 Hatch covers

2.8.1 The scantlings and arrangements of hatches and hatch covers located within vehicle decks are to be not less than that required by the Rules for the supporting structure in which such hatches are fitted. In general the end fixity of primary stiffening members is to be taken as simply supported. Local and secondary stiffening members may be either partially or fully fixed at their end connections dependent upon the proposed arrangement.

2.8.2 In no case, however, are the scantlings of plating and stiffeners to be less than would be required for a weather or cargo deck hatch cover, as applicable.

2.8.3 Where unusual arrangements of hatch cover stiffening are proposed, the scantlings of plating and stiffeners may be determined by direct calculations. The designer's calculations are to be submitted.

2.9 Heavy and special loads

2.9.1 Where heavy or special loads are proposed to be carried, the scantlings and arrangements of the deck structure will be individually considered on the basis of submitted calculations.

2.9.2 Due account is to be taken of the acceleration levels due to ship motion as applicable to particular items of heavy mass such as vehicles, containers, pallets, etc.

2.10 Tracked and steel wheeled vehicles

2.10.1 Where it is proposed to carry tracked vehicles the patch dimensions may be taken as the track print dimensions and F_w is to be taken as half the total weight of the vehicle. Deck fittings in way of vehicle lanes are to be recessed.

2.10.2 Where it is proposed to carry tracked vehicles, the total weight of the vehicle is to be used when determining the section modulus of the transverse at the top of a ramp or at other changes of gradient.

2.10.3 A wear and tear allowance is to be added to the plating thickness and it is not to be less than that defined in 2.3.3.

2.11 Openings in main vehicle deck

2.11.1 Items such as portable plates in main vehicle deck for the removal of machinery parts, etc., may be arranged flush with the deck, provided they are secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters.

2.11.2 Scuppers from vehicle or cargo spaces fitted with an approved fixed pressure water spray fire-extinguishing system are to be led inboard to tanks. Alternatively they may be led overboard providing they comply with Pt 3, Ch 4,7.1.3(a) and (b).

2.11.3 Inboard draining scuppers do not require valves but are to be led to suitable drain tanks (not engine room or hold bilges) and the capacity of the tanks should be sufficient to hold approximately 10 minutes of drenching water. The arrangements for emptying these tanks are to be approved and suitable high level alarms provided.

2.11.4 Air pipes from cofferdams or void spaces may terminate in the enclosed 'tween deck space on the main vehicle deck provided the space is adequately ventilated and the air pipes are provided with weathertight closing appliances.

2.11.5 In addition, the requirements of 3.10.8 to 3.10.10 are to be complied with.

2.12 Direct calculations

2.12.1 Lloyd's Register (hereinafter referred to as 'LR') will consider direct calculations for the derivation of scantlings as an alternative to and equivalent to those derived by Rule requirements. The assumptions made and the calculation procedures used are to be submitted for appraisal in accordance with Pt 3, Ch 1,2.

Section 3 Bow doors

3.1 Application

3.1.1 The requirements of this Section are applicable to the arrangement, strength and securing of bow doors, both the visor and the side opening type doors, and inner doors leading to a complete or long forward enclosed superstructure, or to a long non-enclosed superstructure which is fitted to attain minimum bow height equivalence.

3.1.2 Other types of bow door will be specially considered.

3.1.3 Where the operational requirements dictate that the doors and ramps be deployed at sea or in the surf zone, the strength and operation will be specially considered.

3.2 General

3.2.1 The attention of Owners and Builders is drawn to the additional statutory regulations for bow doors that may be required by the Naval Authority.

3.2.2 Bow doors are to be located above the vertical limit of watertight integrity. A watertight recess is normally permitted below the vertical limit of watertight integrity located forward of the collision bulkhead and above the deepest waterline, for the arrangement of ramps or other related mechanical devices. For any ship where bow doors may be open at sea or located below the vertical limit of watertight integrity, the enclosed spaces protected by the door or ramp are to be considered open as well as closed in damage stability or flooding conditions.

3.2.3 An inner door is to be fitted which is to be gasketed and weathertight. The inner door is to be part of the collision bulkhead. The inner door need not be fitted directly above the bulkhead below, provided it is located within the limits specified for the position of the collision bulkhead, see Pt 3, Ch 2,4. A vehicle ramp may be arranged for this purpose, provided its position complies with Pt 3, Ch 2,4 and the ramp is weathertight over its complete length. In this case the upper part of the ramp higher than 2,3 m above the vertical limit of watertight integrity may extend forward of the limit specified in Pt 3, Ch 2,4. If this is not possible a separate inner weathertight door is to be installed, as far as practicable within the limits specified for the position of the collision bulkhead.

3.2.4 Bow doors are to be fitted as to ensure tightness consistent with operational conditions and to give effective protection to inner doors. Inner doors forming part of the collision bulkhead are to be weathertight over the full height of the vehicle space and arranged with fixed sealing supports on the aft side of the doors.

3.2.5 Bow doors and inner doors are to be arranged so as to preclude the possibility of the bow door causing structural damage to the inner door or to the collision bulkhead in the case of damage to or detachment of the bow door. If this is not possible, a separate inner weathertight door is to be installed, as indicated in 3.2.3.

3.2.6 The requirements for inner doors are based on the assumption that vehicles are effectively lashed and secured against movement in the stowed position.

3.2.7 The scantlings and arrangements of side shell and stern doors are to be in accordance with the requirements of Pt 6, Ch 3.

3.3 Symbols and definitions

3.3.1 The symbols used in this Section are defined as follows:

A_s = area stiffener web, in cm^2

A_x = area, in m^2 , of the transverse vertical projection of the bow door, between the bottom of the door and the top of the door or between the bottom of the door and the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, see Fig. 3.3.2. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser. In determining the height from the bottom of the door to the upper deck or to the top of the door, the bulwark is to be excluded

A_y = area, in m^2 , of the longitudinal vertical projection of the bow door, between the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, see Fig. 3.3.2. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is the lesser

A_z = area, in m^2 , of the horizontal projection of the bow door, between the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, see Fig. 3.3.2. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is the lesser

a_{bv} = vertical distance, in metres, from visor pivot to the centroid of the transverse vertical projected area of the visor door, as shown in Fig. 3.3.2

b_{bv} = horizontal distance, in metres, from visor pivot to the centroid of the horizontal projected area of the visor door, as shown in Fig. 3.3.2

c_{bv} = horizontal distance, in metres, from visor pivot to the centre of gravity of visor mass, as shown in Fig. 3.3.2

d_{bv} = vertical distance, in metres, from bow door pivot to the centre of gravity of the bow door, see Fig. 3.3.2

Special Features

Volume 1, Part 4, Chapter 3

Section 3

- h = height of the door between the levels of the bottom of the door and the upper deck or between the bottom of the door and the top of the door, whichever is the lesser, as shown in Fig. 3.3.1
- k_s = higher tensile steel factor defined in Pt 6, Ch 5,3.1.1
- Q_{bd} = shear force, in kN, in the stiffener calculated by using uniformly distributed external pressure, β_e , as given in Fig. 3.3.1
- W_{bv} = mass of the visor door, in tonnes
- W = breadth of the door at a height $h/2$ above the bottom of the door, in metres, as shown in Fig. 3.3.2
- l_d = length of the door at a height $h/2$ above the bottom of the door, in metres, as shown in Fig. 3.3.2
- τ = shear stress, in N/mm²
- σ = bending stress, in N/mm²
- σ_o = specified minimum yield strength of the material, in N/mm²
- σ_{eq} = equivalent stress, in N/mm²
- $$= \sqrt{\sigma^2 + 3\tau^2}$$

Fig. 3.3.1 Definition of α_f and β_e

3.3.2 Locking device. A device that locks a securing device in the closed position.

3.3.3 Securing device. A device used to keep the door closed by preventing it from rotating about its hinges.

3.3.4 Side-opening doors. Side-opening doors are opened either by rotating outwards about a vertical axis through two or more hinges located near the outboard edges or by horizontal translation by means of linking arms arranged with pivoted attachments to the door and the craft. It is anticipated that side-opening doors are arranged in pairs.

Fig. 3.3.2 Bow visor upward hinging

3.3.5 Supporting device. A device used to transmit external or internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.

3.3.6 Visor doors. Visor doors are opened by rotating upwards and outwards about a horizontal axis through two or more hinges located near the top of the door and connected to the primary structure of the door by longitudinally arranged lifting arms.

3.4 Construction and testing

3.4.1 Plans are to be of sufficient detail for plan approval purposes. Plans showing the proposed scantlings and arrangement of the bow door are to be submitted. Bow doors are to be constructed under survey.

3.4.2 Bow doors fitted below the limit of watertight integrity are to be subject to a pressure test of a prototype to confirm the design pressure head.

3.4.3 As an alternative to prototype testing, the integrity of the door may be demonstrated by calculation and representative testing in accordance with IMO MSC/Circular 1176 – *Unified Interpretations to SOLAS Chapters II-1 and XII and to the Technical Provisions for Means of Access for Inspections*. For doors fitted above the vertical limit of watertight integrity, the doors only require testing following installation, in accordance with Table 6.6.1 in Pt 6, Ch 6.

Special Features

Volume 1, Part 4, Chapter 3

Section 3

3.5 Strength criteria

3.5.1 Scantlings of the primary members, securing and supporting devices of bow doors and inner doors are to be able to withstand the design loads defined in 3.6. The shear, bending and equivalent stresses are not to exceed $80/k_s$ N/mm², $120/k_s$ N/mm² and $150/k_s$ N/mm² respectively.

3.5.2 The buckling strength of primary members is to be verified as being adequate, see Pt 6, Ch 2,3.

3.5.3 For steel to steel bearings in securing and supporting devices, the nominal bearing pressure calculated by dividing the design force by the projected bearing area is not to exceed 80 per cent of the yield stress of the bearing material. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification.

3.5.4 The arrangement of securing and supporting devices is to be such that threaded bolts do not carry support forces. The maximum tension in way of threads of steel bolts not carrying support forces is not to exceed $125/k$ N/mm².

3.6 Design loads

3.6.1 The design external pressure, P_e , for the determination of scantlings for primary members, securing and supporting devices of bow doors is to be taken not less than the following:

$$P_e = 2,75\lambda_G C_H (0,22 + 0,15 \tan \alpha_f) \times (0,4V_{\max} \sin \beta_e + 0,6L_R^{0,5})^2 \text{ kN/m}^2$$

where

V_{\max} = maximum speed, in knots, as defined in Pt 1, Ch 2,2.2.4

L_R = Rule length of ship, in metres, as defined in Pt 3, Ch 1,5.2.2

λ_G = service area factor for mono-hull ships, see Pt 1, Ch 2,3.5

= 1,0 for sea-going ships

= 0,8 for ships operated in coastal waters

= 0,5 for ships operated in sheltered waters

C_H = $0,0125L_R$ for $L_R < 80$ m

= 1,0 for $L_R \geq 80$ m

α_f = flare angle, in degrees, at the point to be considered, defined as the angle between a vertical line and the tangent to the side shell plating, measured in a vertical plane normal to the horizontal tangent to the shell plating, see Fig. 3.3.1

β_e = entry angle, in degrees, at the point to be considered, defined as the angle between a longitudinal line parallel to the centreline and the tangent to the shell plating in a horizontal plane, see Fig. 3.3.1.

3.6.2 The design external forces, F_x , F_y and F_z , in kN, for the determination of scantlings of securing and supporting devices of bow doors are to be not less than $P_e A_x$, $P_e A_y$ and $P_e A_z$ respectively. Where P_e is the external pressure, defined in 3.6.1, with the flare angle, α_f , and the entry angle, β_e , measured at the point on the bow door, $l_d/2$ aft of the stem line on the plane $h/2$ above the bottom of the door, as shown in Fig. 3.3.1. A_x , A_y , A_z and h as defined in 3.3.1.

3.6.3 For bow doors, including bulwark, of unusual form or proportions, the areas used for the determination of the design values of external forces will be specially considered.

3.6.4 For visor doors the closing moment, M_y , under external loads, is to be taken as:

$$M_y = F_x a_{bv} + 10W_{bv} c_{bv} - F_z b_{bv} \text{ kNm}$$

where

W_{bv} , a_{bv} , b_{bv} and c_{bv} as defined in 3.3.1, F_x and F_z as defined in 3.6.2.

3.6.5 The lifting arms of a visor and its supports are to be dimensioned for the static and dynamic forces applied during the lifting and lowering operations, and a minimum wind pressure of 1,5 kN/m² is to be taken.

3.6.6 The design external pressure, in kN/m², for the determination of scantlings for primary members, securing and supporting devices and surrounding structure of inner doors is to be taken as the greater of $0,45L_R$ and $10h^2$, where h^2 is the distance, in m, from the load point to the top of the space enclosed by the visor, L_R , as defined in Pt 3, Ch 1,5.2.2.

3.6.7 The design internal pressure for the determination of scantlings for securing devices of inner doors is not to be taken less than 25 kN/m².

3.6.8 On ships with rounded nose bow and a large stem angle with the waterline, strengthening against horizontal impact loads is to be considered. Similarly, in ships with a flare angle of less than 60° with the waterline, strengthening against vertical impact loads is to be considered.

3.7 Scantlings of bow doors

3.7.1 The strength of bow doors is to be equivalent to the surrounding structure.

3.7.2 Bow doors are to be adequately stiffened and means are to be provided to prevent lateral or vertical movement of the doors when closed. For visor doors adequate strength for the opening and closing operations is to be provided in the connections of the lifting arms to the door structure and to the craft structure.

3.7.3 The thickness of the bow plating is not to be less than that required for the side shell plating, using bow door stiffener spacing, but in no case less than the minimum required thickness of fore end shell plating.

3.7.4 The section modulus of horizontal or vertical stiffeners is not to be less than that required for end framing. Consideration is to be given, where necessary, to differences in fixity between ship's frames and bow doors stiffeners.

3.7.5 The stiffener webs are to have a net sectional area, A_s , not less than:

$$A_s = \frac{23,5Q_{bd}}{\sigma_o} \text{ cm}^2$$

where

A_s , Q_{bd} and σ_o as defined in 3.3.1.

3.7.6 The bow door secondary stiffeners are to be supported by primary members constituting the main stiffening of the door.

3.7.7 The primary members of the bow door and the hull structure in way are to have sufficient stiffness to ensure integrity of the boundary support of the door.

3.7.8 Scantlings of the primary members are generally to be supported by direct calculations in association with the external pressure given in 3.6.1 and permissible stresses given in 3.5.1. In general, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections.

3.7.9 The webs of primary members are to be adequately stiffened, preferably in a direction perpendicular to the shell plating.

3.8 Scantling of inner doors

3.8.1 Scantlings of the primary members are generally to be supported by direct calculations in association with the external pressure given in 3.6.1 and permissible stresses given in 3.5.1. In general, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections.

3.8.2 Where inner doors also serve as a vehicle ramps, the scantlings are not to be less than those required for vehicle decks.

3.8.3 The distribution of forces acting on the securing and supporting devices is, in general, to be supported by direct calculations taking into account the flexibility of the structure and actual position and stiffness of the supports.

3.9 Securing and supporting of bow doors

3.9.1 Bow doors are to be fitted with adequate means of securing and supporting so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the bow doors is to be suitable for the same design loads and design stresses as the securing and supporting devices. Where packing is required, the packing material is to be of a comparatively soft type, and the supporting forces are to be carried by the steel structure only. Other types of packing may be considered. Maximum design clearance between securing and supporting devices is, in general, not to exceed 3 mm. A means is to be provided for mechanically fixing the door in the open position.

3.9.2 Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included and considered to calculate the reaction forces acting on the devices. Small and/or flexible devices such as cleats intended to provide load compression of the packing material are, in general, not to be included in the calculations called for in 3.9.8. The number of securing and supporting devices are, in general, to be the minimum practical whilst taking into account the requirements for redundant provision given in 3.9.9 and 3.9.10 and the available space for adequate support in the hull structure.

3.9.3 For opening outwards visor doors, the pivot arrangement is generally to be such that the visor is self closing under external loads, that is $M_y > 0$. Moreover, the closing moment, M_y , as given in 3.6.4 to be not less than:

$$M_y = 10W_{bv} c_{bv} + 0,1(a_{bv}^2 + b_{bv}^2)^{0,5} (F_x^2 + F_z^2)^{0,5}$$

where

W_{bv} , a_{bv} , b_{bv} and c_{bv} as defined in 3.3.1, F_x and F_z as defined in 3.6.2.

3.9.4 Securing and supporting devices are to be adequately designed so that they can withstand the reaction forces within the permissible stresses given in 3.5.1.

3.9.5 For visor doors the reaction forces applied on the effective securing and supporting devices assuming the door as a rigid body are determined for the following combination of external loads acting simultaneously together with the self weight of the door.

Case 1 F_x and F_z

Case 2 $0,7F_y$ acting on each side separately together with $0,7F_x$ and $0,7F_z$

where

F_x , F_y and F_z are to be determined as indicated in 3.6.2 and applied at the centroid of projected areas.

3.9.6 For side-opening doors the reaction forces applied on the effective securing and supporting devices assuming the door as a rigid body are determined for the following combination of external loads acting simultaneously together with the self weight of the door:

Case 1 F_x , F_y and F_z acting on both doors

Case 2 $0,7 F_x$ and $0,7F_z$ acting on both doors and $0,7F_y$ acting on each door separately

where

F_x , F_y and F_z are to be determined as indicated in 3.6.2 and applied at the centroid of projected areas.

3.9.7 The support forces as determined according to 3.9.5 and 3.9.6 are generally to give rise to a zero moment about the transverse axis through the centroid of the area, A_x . For visor doors, longitudinal reaction forces of pin and/or wedge supports at the door base contributing to this moment are not to be of the forward direction.

3.9.8 The distribution of the reaction forces acting on the securing and supporting devices may require to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position and stiffness of the supports.

3.9.9 The arrangement of securing and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable to withstand the reaction forces without exceeding by more than 20 per cent the permissible stresses as given in 3.5.1.

3.9.10 For visor doors, two securing devices are to be provided at the lower part of the door, each capable of providing the full reaction force required to prevent opening of the door within the permissible stresses given in 3.5.1. The opening moment, M_o , to be balanced by this reaction force, is not to be taken less than:

$$M_o = 10W_{bv} d_{bv} + 5A_x a_{bv} \text{ kNm}$$

where

W_{bv} , A_x , d_{bv} and a_{bv} as defined in 3.3.1.

3.9.11 For visor doors, the securing and supporting devices excluding the hinges should be capable of resisting the vertical design force ($F_z - 10W_{bv}$), in kN, within the permissible stresses given in 3.5.1.

3.9.12 All load transmitting elements in the design load path, from door through securing and supporting devices into the ship structure, including welded connections, are to be the same strength. These elements include pins, supporting brackets and back-up brackets. Where cut-outs are made in the supporting structure, the strength and stiffness will be specially considered.

3.9.13 For side-opening doors, thrust bearings have to be provided in way of girder ends at the closing of the two leaves to prevent one leaf to shift towards the other one under effect of unsymmetrical pressure, see Fig. 3.3.3. Each part of the thrust bearing has to be kept secured on the other part by means of securing devices. Any other arrangement serving the same purpose is to be submitted for appraisal.

3.9.14 The spacing for side and top cleats should not exceed 2,5 m and there should be cleats positioned as close to the corners as practicable. Alternative arrangements for ensuring weathertight sealing will be specially considered.

Fig. 3.3.3 Typical thrust bearing

3.10 Securing and locking arrangements

3.10.1 Securing devices are to be simple to operate and easily accessible. Securing devices are to be equipped with mechanical locking arrangement (self locking or separate arrangement), or be of the gravity type. The opening and closing systems as well as securing and locking devices are to be interlocked in such a way that they can only operate in the proper sequence.

3.10.2 Bow doors and inner doors giving access to vehicle decks are to be provided with an arrangement for remote control, from a position above the vertical limit of watertight integrity, of:

- the closing and opening of the doors, and
 - associated securing and locking devices for every door.
- Indication of the open/closed position of every door and every securing and locking device is to be provided at the remote control stations. The operating panels for operation of doors are to be inaccessible to unauthorised persons. A notice plate, giving instructions to the effect that all securing devices are to be closed and locked before leaving harbour, is to be placed at each operating panel and is to be supplemented by warning indicator lights.

3.10.3 Where hydraulic securing devices are applied, the system is to be mechanically lockable in closed position so that in the event of loss of the hydraulic fluid, the securing devices remain locked. The hydraulic system for securing and locking devices is to be isolated from other hydraulic circuits when in closed position.

3.10.4 Separate indicator lights and audible alarms are to be provided on the navigation bridge and on the operating panel to show that the bow door and inner door are closed and that their securing and locking devices are properly positioned. The indication panel is to be provided with a lamp test function. The indicator lights are to be provided with a permanent power supply, further, arrangements are to be such that it is not possible to turn off these lights in service.

3.10.5 The indicator system is to be designed on the fail-safe principle and is to show by visual alarms if the door is not fully closed and not fully locked and by audible alarms if securing devices become open or locking devices become unsecured. The power supply for the indicator system is to be independent of the power supply for operating and closing the doors. The sensors of the indicator system are to be protected from water, ice formation and mechanical damages.

3.10.6 The indication panel on the navigation bridge is to be equipped with a mode selection function 'harbour/sea voyage', so arranged that audible alarm is given if the ship leaves harbour with the bow door or inner door not closed and with any of the securing devices not in the correct position.

3.10.7 A water leakage detection system with audible alarm and television surveillance are to be arranged to provide an indication to the navigation bridge and to the engine control room of leakage through the inner door.

3.10.8 Between the bow door and the inner door a television surveillance system is to be fitted with a monitor on the navigation bridge and in the machinery control room. The system is to be able to monitor the position of doors and a sufficient number of their securing devices. Special consideration is to be given for lighting and contrasting colour of objects under surveillance.

3.10.9 A drainage system is to be arranged in the area between bow door and ramp, or where no ramp is fitted, between the bow door and inner door. The system is to be equipped with an audible and visual alarm function to the navigation bridge being set off when the water levels in these areas exceed 0,5 m or the high water level alarm, whichever is the lesser. If not discharged by a bilge suction, scuppers are to be provided port and starboard having a diameter of not less than 50 mm. Valves are to be fitted.

3.10.10 If the main vehicle deck is not totally enclosed, scuppers or freeing ports are to be provided consistent with the requirements of Pt 3, Ch 4,8.

3.10.11 Air pipes from cofferdams or void spaces may terminate in the enclosed 'tween deck space on the main vehicle deck provided the space is adequately ventilated and the air pipes are provided with weathertight closing appliances.

3.11 Operating and Maintenance Manual

3.11.1 An Operating and Maintenance Manual for the bow doors and inner doors is to be provided on board.

The manual is to contain the following information:

- (a) main particulars and design drawings,
 - special safety precautions;
 - details of vessel, class and statutory certificates;
 - equipment and design loading for ramps;
 - key plan of equipment for doors and ramps;
 - manufacturers' recommended testing for equipment; and
 - a description of the following equipment:
 - bow doors;
 - inner bow doors;

bow ramp/doors;
central power pack;
bridge panel;
ramps leading down from the main deck;
engine control room panel.

- (b) service conditions:
 - limiting heel and trim of the ship for loading/unloading;
 - limiting heel and trim for door operations;
 - operating instructions for doors and ramps; and
 - emergency operating instructions for doors and ramps.
- (c) maintenance:
 - schedule and extent of maintenance;
 - trouble shooting and acceptable clearances; and
 - manufacturers' maintenance procedures.
- (d) register of inspections, including inspection of locking, securing and supporting devices, repairs and renewals.

This Manual is to be submitted for approval and is to contain a note recommending that recorded inspections of supporting and securing devices carried out by the ship's staff at monthly intervals, or following incidents that could result in damage, including heavy weather or contact in the region of the doors. Any damages recorded during such inspections are to be reported to LR.

3.11.2 Documented operating procedures for closing and securing the bow door and inner door are to be kept on board and posted at an appropriate place.

Section 4 Side, stern doors and other shell openings

4.1 Symbols

4.1.1 The symbols used in this Section are defined as follows:

- d = distance between closing devices, in metres
- k_s = material factor, see Pt 6, Ch 5,3.1.1 but is not to be taken less than 0,72 unless demonstrated otherwise by a direct strength analysis with regard to relevant modes of failure
- I = moment of inertia, in cm^4 , of the stiffener or girder, in association with an effective width of attached plating determined in accordance with Pt 6, Ch 2,5
- σ = bending stress, in N/mm^2
- σ_e = equivalent stress, in N/mm^2

$$= \sqrt{(\sigma^2 + 3\tau^2)}$$
- σ_0 = minimum yield stress of the bearing material, in N/mm^2
- τ = shear stress, in N/mm^2 .

4.2 General

4.2.1 These requirements cover service doors in the ship side (abaft the collision bulkhead) and stern area, below the weather deck and in enclosed superstructures.

4.2.2 For the requirements of bow doors, see Section 3.

4.2.3 Side and stern doors are to be so fitted as to ensure tightness and structural integrity commensurate with their location and the surrounding structure, see also Pt 3, Ch 1,5.

4.2.4 In general, the lower edge of door openings is not to be below a line drawn parallel to the design draught.

4.2.5 When the lower edge is below the design draught or doors below the vertical limit of watertight integrity are to be opened at sea, the arrangements will be specially considered. In general, the enclosed spaces protected by the door are to be considered open as well as closed in damage stability or flooding conditions.

4.2.6 Doors are generally to be arranged to open outwards, however inward opening doors will be considered provided strongbacks are fitted when the doors are situated in the first two lower decks above the waterline.

4.2.7 For ships complying with the requirements of this Section, the securing, supporting and locking devices are defined in 3.3.

4.3 Construction and testing

4.3.1 Plans are to be of sufficient detail for plan approval purposes. Plans showing the proposed scantlings and arrangements of any side and stern doors or other shell openings are to be submitted. Side and stern doors or other shell openings are to be constructed under survey.

4.3.2 Side and stern doors fitted below the limit of watertight integrity are to be subject to a pressure test of a prototype to confirm the design pressure head.

4.3.3 As an alternative to prototype testing, the integrity of the door may be demonstrated by calculation and representative testing in accordance with IMO MSC/Circular 1176 – *Unified Interpretations to SOLAS Chapters II-1 and XII and to the Technical Provisions for Means of Access for Inspections*. For doors fitted above the vertical limit of watertight integrity, the doors only require testing following installation, in accordance with Table 6.6.1 in Pt 6, Ch 6.

4.4 Scantlings

4.4.1 In general the strength of side and stern doors is to be equivalent to the strength of the surrounding structure.

4.4.2 Door openings in the side shell are to have well rounded corners and adequate compensation is to be arranged with web frames at sides and stringers or equivalent above and below, see Pt 3, Ch 1,5.

4.4.3 Doors are to be adequately stiffened, and means are to be provided to prevent movement of the doors when closed. Adequate strength is to be provided in the connections of the lifting/manoeuvring arms and hinges to the door structure and to the ship structure.

4.4.4 The thickness of the door plating is to be not less than the shell plating calculated with the door stiffener spacing, and in no case to be less than the minimum adjacent shell thickness.

4.4.5 Where stern doors are protected against direct wave impact by a permanent external ramp, the thickness of the stern door plating may be reduced by 20 per cent relative to the requirements of 4.4.4. Those parts of the stern door which are not protected by the ramp are to have the thickness of plating in full compliance with 4.4.4.

4.4.6 Where higher tensile steel is proposed, the plating thickness required in 4.4.4 and 4.4.5 may be reduced by $\sqrt{k_s}$.

4.4.7 The section modulus of horizontal or vertical stiffeners is to be not less than required for the adjacent shell framing using the actual stiffener spacing. Consideration is to be given, where necessary, to differences in fixity between ship's frames and door stiffeners.

4.4.8 Where necessary, door secondary stiffeners are to be supported by primary members constituting the main stiffening elements of the door.

4.4.9 The scantlings of such primary members are to be based on direct strength calculations. Normally, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections. The design load is the uniformly distributed external sea pressure, p_e , as defined in 4.9.1. For minimum scantlings, p_e , is to be taken as 25 kN/m² and the permissible stresses as follows:

$$\tau = \frac{80}{k_s} \text{ N/mm}^2$$

$$\sigma = \frac{120}{k_s} \text{ N/mm}^2$$

$$\sigma_e = \frac{150}{k_s} \text{ N/mm}^2$$

4.4.10 The webs of primary members are to be adequately stiffened, preferably in a direction perpendicular to the shell plating.

4.4.11 The stiffness of the edges of the doors and the hull structure in way are to be sufficient to ensure weathertight integrity. Edge stiffeners/girders are to be adequately stiffened against rotation and are to have a moment of inertia not less than:

$$I = 0,8P_L d^4 \text{ cm}^4$$

where

$$P_L = \text{packing line pressure along edges, not to be taken less than 50 N/cm.}$$

For edge girders supporting main door girders between securing devices, the moment of inertia is to be increased in relation to the additional force.

4.4.12 The buckling strength of primary members is to be specially considered.

4.4.13 All load transmitting elements in the design load path from door through securing arrangements and supporting devices into the ship structure, including welded connections, are to be to the same strength standard as required for the securing and supporting devices. These elements include pins, supporting brackets and back-up brackets. Where cut-outs are made in the supporting structure, the strength and stiffness will be specially considered.

4.5 Doors serving as ramps

4.5.1 Where doors also serve as vehicle ramps, the plating and stiffeners are to be not less than required for vehicle decks, see Section 2.

4.5.2 The design of the hinges for these doors should take into account the ship angle of trim or heel which may result in uneven loading of the hinges.

4.6 Closing, securing and supporting of doors

4.6.1 Doors are to be fitted with adequate means of closing, securing and support so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the doors is to be suitable for the same design loads and design stresses as the securing and supporting devices. Where packing is required, the packing material is to be of comparatively soft type, and the supporting forces are to be carried by the steel structure only. Other types of packing may be considered. Maximum design clearance between securing and supporting devices is generally not to exceed 3 mm.

4.6.2 Devices are to be simple to operate and easily accessible. They are to be of an approved type.

4.6.3 Securing devices are to be equipped with mechanical locking arrangements (self locking or separate arrangements), or are to be of gravity type. The opening and closing systems as well as securing and locking devices are to be interlocked in such a way that they can only operate in a proper sequence.

4.6.4 Means are to be provided to enable the doors to be mechanically fixed in the open position taking into account the self weight of the door and a minimum wind pressure of 1,5 kN/m² acting on the maximum projected area in the open position.

4.6.5 The spacing for cleats or closing devices should not exceed 2,5 m and there should be cleats or closing devices positioned as close to the corners as practicable. Alternative arrangements for ensuring weathertight sealing will be specially considered.

4.7 Systems for operation

4.7.1 Doors with a clear opening area of 12 m² or greater are to be provided with closing devices operable from a remote control position. Doors which are located partly or totally below the vertical limit of watertight integrity with a clear opening area greater than 6 m² are to be provided with an arrangement for remote control from a position above the vertical limit of watertight integrity. This remote control is provided for the:

- (a) Closing and opening of the doors.
- (b) Associated securing and locking devices.

4.7.2 The location of the remote control panel is to be such that the opening/closing operation can be easily observed by the operator or by other suitable means such as closed circuit television.

4.7.3 A notice is to be displayed at the operating panel stating that the door is to be fully closed and secured preferably before, or immediately after the ship leaves the berth and that this operation is to be entered in the ship's log.

4.7.4 Means are to be provided to prevent unauthorised operation of the doors.

4.7.5 Where hydraulic securing devices are applied, the system is to be mechanically lockable in the closed position so that in the event of hydraulic system failure, the securing devices will remain locked. The hydraulic system for securing and locking devices is to be isolated from other hydraulic circuits when in the closed position.

4.8 Systems for indication and monitoring

4.8.1 The following requirements apply to doors in the boundaries of special category spaces or vehicle spaces, through which such spaces may be flooded. For ships, where no part of the door is below the design waterline, doors that are to be opened at sea are above the vertical limit of watertight integrity, and the area of the door opening is not greater than 6 m², then the requirements of this Section need not be applied.

4.8.2 Separate indicator lights and audible alarms are to be provided on the navigation bridge and on each operating panel to indicate that the doors are closed and that their securing and locking devices are properly positioned. The indication panel is to be provided with a lamp test function. It is not to be possible to turn off the indicator light.

4.8.3 The indicator system is to be designed on the fail safe principle and is to indicate by visual alarms if the door is not fully closed and not fully locked, and by audible alarms if securing devices become open or locking devices become unsecured. The power supply for the indicator system is to be independent of the power supply for operating and closing the doors and is to be provided with a back-up power supply. The sensors of the indicator system are to be protected from water, ice formation and mechanical damages.

4.8.4 The indication panel on the navigation bridge is to be equipped with a mode selection function 'harbour/sea voyage', so arranged that audible alarm is given if the vessel leaves harbour with side shell or stern doors not closed or with any of the securing devices not in the correct position.

4.9 Design loads

4.9.1 The design force considered for the scantlings of primary members, securing and supporting devices of side shell doors and stern doors are to be taken not less than:

(a) Design forces for securing or supporting devices of doors opening inwards:

External force:

$$F_e = Ap_e + F_p \text{ kN}$$

Internal force:

$$F_i = F_o + 10W \text{ kN}$$

(b) Design forces for securing or supporting devices of doors opening outwards:

External force:

$$F_e = Ap_e \text{ kN}$$

Internal force:

$$F_i = F_o + 10W + F_p \text{ kN}$$

(c) Design forces for primary members:

External force:

$$F_e = Ap_e \text{ kN}$$

Internal force:

$$F_i = F_o + 10W \text{ kN}$$

whichever is the greater.

The symbols used are defined as follows:

p_e = external sea pressure, in kN/m², determined at the centre of gravity of the door opening and is not to be taken less than:

$$\text{for } Z_G < T \quad 10(T - Z_G) + 25 \text{ kN/m}^2$$

$$\text{for } Z_G \geq T \quad 25 \text{ kN/m}^2$$

For stern doors, p_e is not to be taken less than:

$$p_{e\min} = 0,6\lambda C_H (0,8 + 0,6 \sqrt{L_R})^2 \text{ kN/m}^2$$

T = summer draught, in metres

Z_G = height of the centre of area of the door, in metres, above the baseline

L_R = length of ship, but need not be taken greater than 200 m

λ = coefficient depending on the area where the ship is intended to be operated:

= 1 for sea going ships with service area notation **SA1**, **SA2** and **SA3**

= 0,5 for ships operated in sheltered waters with service area notation **SA4**

C_H = 0,0125 L_R for $L_R < 80$ m

= 1 for $L_R \geq 80$ m

A = area, in m², of the door opening

W = weight of the door, in tonnes

F_p = total packing force, kN. When packing is fitted, the packing line pressure is to be specified, normally not to be taken less than 5 kN/m²

F_o = the greater of F_c and 5,0A kN

F_c = accidental force, in kN, due to loose cargo, etc., to be uniformly distributed over the area A and not to be taken less than 300 kN. For small doors such as bunker doors and pilot doors, the value of F_c may be taken as zero, provided an additional structure such as an inner ramp is fitted, which is capable of protecting the door from accidental force due to loose items.

4.10 Design of securing and supporting devices

4.10.1 Securing devices and supporting devices are to be designed to withstand the forces given above using the following permissible stresses:

The terms 'securing device' and 'supporting device' are defined in Section 3.

$$\tau = \frac{80}{k_s} \text{ N/mm}^2$$

$$\sigma = \frac{120}{k_s} \text{ N/mm}^2$$

$$\sigma_e = \frac{150}{k_s} \text{ N/mm}^2$$

4.10.2 The arrangement of securing and supporting devices is to be such that threaded bolts are not to carry support forces. The maximum tensile stress in way of threads of bolts, not carrying support forces, is not to exceed:

$$\frac{125}{k} \text{ N/mm}^2$$

4.10.3 For steel to steel bearings in securing and supporting devices, the normal bearing pressure is not to exceed $0,8\sigma_o$, see 4.1.1. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification. The normal bearing pressure is to be calculated by dividing the design force by the projected bearing area.

4.10.4 The distribution of the reaction forces acting on the securing and supporting devices may require to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position and stiffness of the supports. Small and/or flexible devices, such as cleats, intended to provide load compression of the packing material are not generally to be included in these calculations.

4.10.5 Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be considered in the calculation of the reaction forces acting on the devices.

4.10.6 The number of securing and supporting devices is generally to be the minimum practicable whilst complying with 4.6.3 and taking account of the available space in the hull for adequate support.

4.10.7 The arrangement of securing devices and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable of withstanding the reaction forces, without exceeding, by more than 20 per cent, the permissible stresses as defined in 4.10.1.

4.11 Operating and Maintenance Manual

4.11.1 An Operating and Maintenance Manual for the doors is to be provided on board.

The manual is to contain the following information:

- (a) main particulars and design drawings,
 - special safety precautions;
 - details of vessel, class and statutory certificates;
 - equipment and design loading for ramps;
 - key plan of equipment for doors and ramps;
 - manufacturers' recommended testing for equipment; and
 - a description of the following equipment:
 - side doors;
 - stern doors;
 - central power pack;
 - bridge panel;
 - ramps leading down from the main deck;
 - engine control room panel.
- (b) service conditions:
 - limiting heel and trim of the ship for loading/unloading;
 - limiting heel and trim for door operations;
 - operating instructions for doors and ramps; and
 - emergency operating instructions for doors and ramps.
- (c) maintenance:
 - schedule and extent of maintenance;
 - trouble shooting and acceptable clearances; and
 - manufacturers' maintenance procedures.
- (d) register of inspections, including inspection of locking, securing and supporting devices, repairs and renewals.

4.11.2 The Manual is to be submitted for approval, and is to contain a note recommending that recorded inspections of the door supporting and securing devices be carried out by the ship's staff at monthly intervals or following incidents that could result in damage, including heavy weather or contact in the region of the doors. Any damages recorded during such inspections are to be reported to LR.

4.11.3 Documented operating procedures for closing and securing the doors are to be kept on board and posted at an appropriate place.

Section 5

Movable decks, lifts, internal and external ramps

5.1 Classification

5.1.1 At the Owner's or Builder's request movable decks will be included as a classification item, and the class notation **Movable decks** will be entered in the *Register Book*. In such cases, all movable decks on board the ship are to comply with the requirements of this Section.

5.1.2 Plans showing the proposed scantlings and arrangements of the system are to be submitted.

5.1.3 The operating and securing equipment or machinery is to be in accordance with the requirements of the Naval Authority, see Pt 1, Ch 2,2.2.6.

5.2 Arrangements and design

5.2.1 Positive means of control are to be provided to secure decks, ramps and lifts in the raised and lowered position.

5.2.2 For steel to steel bearings in securing and supporting devices, the nominal bearing pressure calculated by dividing the design force by the projected bearing area is not to exceed 80 per cent of the yield stress of the bearing material. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specifications.

5.2.3 The arrangement of securing and supporting devices is to be such that threaded bolts do not carry support forces. The maximum tension in way of threads of steel bolts not carrying support forces is not to exceed 125/k N/mm².

5.3 Loading

5.3.1 Details of the deck, ramp or lift loading resulting from the proposed stowage arrangements of vehicles are to be supplied by the Shipbuilder. These details are to include the axle and wheel spacing, the wheel load, type of tyre and tyre print dimensions for the vehicles. For design purposes the wheel loading is to be taken as not less than 3,0 kN, see Section 2.

5.3.2 Where it is proposed also to use the decks, ramps or lifts for general cargo, the design loadings are to be submitted for consideration.

5.3.3 The forces imposed on the decks, ramps or lifts are to take due account of the ship motion for all the conditions in which they will be operated, see Pt 5, Ch 3,6.2.

5.3.4 The scantlings and arrangements are to be not less than those required by the Rules for the supporting or surrounding structure in which the decks ramps or lifts are fitted. In general the end fixity of primary stiffening members is to be taken as simply supported. Local and secondary stiffening members may be either partially or fully fixed at their end connections dependent upon the proposed arrangement.

5.3.5 The buckling strength of primary members is to be verified as being adequate, see Pt 6, Ch 2,3.

5.3.6 Decks, ramps or lifts and their supporting structure are to be designed for the maximum load that is to be carried; this may include loadings from emergency situations where they are defined by the Owner.

5.4 Movable decks

5.4.1 Movable decks are generally to be constructed as pontoons comprising a web structure with top decking. Other forms of construction will be individually considered.

5.4.2 The decks are to be efficiently supported, and hinges, pillars, chains or other means (or a combination of these) are to be designed on the basis of the imposed loads. Where supporting chains and fittings are required, they are to have a factor of safety of at least two on the proof load.

5.4.3 Where it is proposed to stow the pontoons on deck, when not in use, details of the proposals for racks, fittings, etc., are to be submitted for consideration.

5.4.4 Where wheeled vehicles are to be used, the supporting arrangements are to be such that the movement at the edge of one pontoon relative to the next does not exceed 50 mm during vehicle operations.

5.5 External deck ramps and lifts

5.5.1 In addition to the loading specified in 5.3, ramps and lifts are to be assessed using weather deck loading in the closed position, see Pt 5, Ch 3,5.

5.6 External shell ramps

5.6.1 In addition to the loading specified in 5.3, unprotected ramps are to be assessed using side shell loading in the closed position, see Pt 5, Ch 3,3.

5.6.2 Scantlings of the primary members, securing and supporting devices of bow doors and inner doors are to be able to withstand the design loads defined in 3.6. The shear, bending and equivalent stresses are not to exceed $80/k \text{ N/mm}^2$, $120/k \text{ N/mm}^2$ and $150/k \text{ N/mm}^2$ respectively.

5.7 Aircraft lifts

5.7.1 The aircraft lift platform deck alignment is to be provided by keeps at the flight deck and stops at the hangar deck.

5.7.2 If the ship has an underwater shock notation, latches are also to be provided at the flight and hangar deck levels to restrain the aircraft lift platform when stationary.

5.7.3 When transferring the aircraft or equipment to, or from, the lift platform with the keeps engaged the deflection of the platform edge is not to be greater than 25 mm.

- 3 **Model experiments**

■ **Section 1**
Introduction

1.1 General

1.1.1 The global and local design loads and criteria detailed in this Part are to be used in conjunction with the formulae given in Part 6 to determine the scantlings of naval ships as defined in Part 1.

1.1.2 When appropriate, the load and design criteria detailed in this Part are to be supplemented by direct calculation methods incorporating model test results and numerical analysis for novel designs. Full scale measurements may be required where considered necessary by Lloyd's Register (hereinafter referred to as 'LR').

1.1.3 Alternative methods of establishing the load and design criteria will be specially considered, provided that they are based on model tests, full scale measurements or generally accepted theories. In such cases, full details of the methods used are to be provided when plans are submitted for approval.

■ **Section 2**
Direct calculations

2.1 General

2.1.1 Direct calculations using hydrodynamic computer programs may be specifically required by the Rules. Also, they may be required for craft having novel design features, or may be submitted in support of alternative load and design criteria. LR may, when requested, undertake calculations on behalf of designers and make recommendations in regard to suitability of any required model tests.

2.2 Naval Ship Rules Software

2.2.1 LR's direct calculation procedures and facilities are summarised in a publication entitled the *LR Software Guide*.

2.3 Submission of direct calculations

2.3.1 In cases where direct calculations have been carried out the following supporting information is to be submitted as applicable:

- (a) Reference to the direct calculation procedure and technical program used.
- (b) Input data.
- (c) A description of the direct calculation model.
- (d) A summary of analysis parameters including environmental conditions, speeds and headings.
- (e) Details of the weight distributions.
- (f) A comprehensive summary of calculation results. Sample calculations are to be submitted where appropriate.

2.3.2 In general, all input data and output results are required to be submitted. In such cases, electronic transferral of data with agreed format may be used for submission.

2.3.3 The responsibility for error free specification and input of program data and the subsequent correct interpretation of output rests with the designer/Builder.

■ **Section 3**
Model experiments

3.1 General

3.1.1 LR may require model experiments and theoretical calculations to be carried out for novel or complex design concepts. It is advisable that details of all proposed model experiments and theoretical calculations are submitted to LR prior to commencement of the testing and analysis phases. The results of all such investigations are to be provided no later than when plans are submitted for approval, but preferably as early as possible.

3.1.2 Where model testing is undertaken, the following details are to be submitted:

- (a) a summary of the model construction and its instrumentation, including calibration of instruments;
- (b) a summary of the testing arrangements and procedures;
- (c) a summary of the tank facilities and test equipment;
- (d) details of the wave generation, response measurements, definitions and notations;
- (e) details of data recording, data reduction and data analysis procedures;
- (f) details of calibration procedures with theoretical computations; and
- (g) tabulated and plotted output.

3.2 Model test matrix

3.2.1 Where model testing is undertaken, the minimum test matrix shown in Table 1.3.1 is required to be carried out.

Table 1.3.1 Minimum test matrix

Item	Test matrix
Sea state	Regular and irregular seas, using the wave environment details in Chapter 2
Heading	Beam, head, stern and bow and stern quartering seas
Speed	Three speeds including zero and maximum service speeds
Wave Frequency	Six frequencies for regular seas

3.2.2 In addition to those quantities which are normally measured in a model experiment, the following data is to be obtained where appropriate:

- (a) vertical accelerations at the LCG, bow and stern;
- (b) acceleration loads due to heave, pitch and roll;
- (c) vertical bending moment;
- (d) bow impact pressures at representative operational forward speeds;
- (e) oblique sea loads inducing horizontal bending moments and torsional moments.

3.2.3 The basis on which the parameters are chosen for investigation is to be submitted for approval at the earliest opportunity.

3.2.4 Results from open water model experiments and full scale measurements may be accepted, full details are to be submitted for appraisal.

Environmental Conditions

Volume 1, Part 5, Chapter 2

Section 1

Section

- 1 **General**
- 2 **Wave environment**
- 3 **Air environment**
- 4 **Guidance for ice environment**

- (a) Service area notation required together with the required extent of the operational area.
- (b) The wave environmental parameters for the design.
- (c) Specification of the environmental conditions used for the design assessment.

1.2 Definitions and symbols

1.2.1 Beaufort Number. Beaufort Number is a measure of wind strength. The wind speed corresponding to each Beaufort number is shown in Table 2.1.1.

1.2.2 Sea state. Sea state is an expression used to categorise wave conditions and is normally defined by a significant wave height and wave period, a suitable wave energy distribution may also be defined. A list of standard sea state definitions is shown in Table 2.1.2.

1.2.3 Wave period. References to wave period are to be taken as the zero crossing wave period, i.e. the average time interval between upward crossings of the mean value, unless otherwise stated.

1.2.4 L_{WL} is defined in Pt 3, Ch 1,5.2.

Section 1 General

1.1 Introduction

1.1.1 This Chapter contains information regarding the environmental conditions to be applied in the derivation of loads that are to be used for the computation of the local and global design loads in Chapters 3 and 4.

1.1.2 Environmental conditions include natural phenomena such as wind, wave and currents and also ice and thermal conditions.

1.1.3 The environmental conditions given here are derived from hindcast data, long term measurements and theoretical studies complemented with service experience.

1.1.4 Alternative methods of establishing the environmental conditions will be specially considered, provided that they are based on hindcast data, long term measurements, global and local environmental theoretical models, or similar techniques. In such cases, full details of the methods used are to be provided when plans are submitted for approval.

1.1.5 In order that an assessment of the design requirements can be made, the following information is to be submitted:

Table 2.1.1 Wind data

Beaufort number	Wind speed range knots
0	0–1
1	1–3
2	4–6
3	7–10
4	11–16
5	17–21
6	22–27
7	28–33
8	34–40
9	41–47
10	48–55
11	56–63

Table 2.1.2 Sea state data

Sea State Number	Significant Wave height(m)		Sustained Wind Speed (Knots) (See Note 1)		Percentage probability of sea state	Modal Wave Period (sec)	
	Range	Mean	Range	Mean		Range (see Note 3)	Most probable
0–1	0–0,1	0,05	0–6	3	0,7	—	—
2	0,1–0,5	0,3	7–10	8,5	6,8	3,3–12,8	7,0
3	0,5–1,25	0,88	11–16	13,5	23,7	5,0–14,8	7,5
4	1,25–2,5	1,88	17–21	19	27,8	6,1–15,2	8,8
5	2,5–4	3,25	22–27	24,5	20,64	8,3–15,5	9,7
6	4–6	5	28–47	37,5	13,15	9,8–16,2	12,4
7	6–9	7,5	48–55	51,5	6,05	11,8–18,5	15,0
8	9–14	11,5	56–63	59,5	1,11	14,2–18,6	16,4
>8	>14	>14	>63	>63	0,05	18,0–23,7	20,0

NOTES

1. Ambient wind sustained at 19,5 m above surface to generate fully-developed seas.
2. To convert to another altitude, H_2 , apply $V_2 = V_1 (H_2/19,5)^{(1/7)}$
3. Minimum is 5 per cent and maximum is 95 per cent for periods given wave height range.
4. The wave period shown here is the modal or peak period, T_p . The zero crossing period, T_z , may be derived by the expression $T_z = T_p/1,4$ for fully developed seas.

■ Section 2 Wave environment

2.1 General

2.1.1 Generally ships of Naval Ship Groups 1 and 2, **NS1** and **NS2**, see Pt 1, Ch 2,2.1 will be designed for unrestricted world-wide operation. Ships in group 3, **NS3**, may also be designed for world-wide operation but typically will be designed for more specific roles within clearly defined areas of operation, e.g., coastal patrol craft, landing craft, harbour vessels, tugs, etc.

2.1.2 The procedure for deriving the design factors and the wave environment used for the assessment of local and global loads is illustrated in Fig. 2.2.1.

2.1.3 The following definitions are applicable:

Service area

A service area refers to a collective group of sea areas. The service area specifies the limits of the ship's operational area.

Sea area

A sea area is a small area of the world's oceans for which statistical wave data has been collected, the sea areas are shown in Fig. 2.2.2.

2.2 Service areas

2.2.1 All ships classed under the Rules will be assigned a service area notation **SA** followed by a number or letter, e.g. **SA1**.

2.2.2 The service area notations listed below are available. The definitive extents of the service areas are shown in Fig. 2.2.2 and Table 2.2.3. The chart shows the minimum service area requirement for operating in different areas of the world.

- SA1** Service Area 1 covers ships having unrestricted world-wide operation. Service area 1 includes operation in all other service areas.
- SA2** Service Area 2 is primarily intended to cover ships designed to operate in tropical and temperate regions, see 2.2.3. This service area excludes operating in sea areas for which a **SA1** notation is required.
- SA3** Service Area 3 is primarily intended to cover ships designed to operate in tropical regions, see 2.2.3. This service area excludes operating in sea areas for which a **SA1** or **SA2** notation is required.
- SA4** Service Area 4 covers ships designed to operate in Sheltered water, as defined in Pt 1, Ch 2,2.2. This service area excludes operating in sea areas for which a **SA1**, **SA2** or **SA3** notation is required.
- SAR** Service Area Restricted covers ships that are designed to operate in a predetermined and contiguous area of operation, see 2.2.4.

2.2.3 For all ships that are designed for specific areas of operation, the designer may take advantage of reduced wave loadings that are likely to be encountered. This covers all ships which are assigned a service area notation **SA2**, **SA3**, **SA4** or **SAR**.

2.2.4 For all cases where a **SAR** service area notation (Service Area Restricted) is required, the extents of the restricted area will be specified after the **SAR** service area notation. The service area factor, f_s , and the wave environment characteristics for the ship will be specially considered. Where the geographical limits of the intended service can be satisfied by a single or group of contiguous sea areas then the service area factor, f_s , and the wave environment characteristics may be derived using the methods given in 2.4 and 2.5.

2.2.5 Under normal circumstances, a ship which is assigned a service area notation **SA2**, **SA3**, **SA4** or **SAR** is to operate in solely the designated area and is not transit to other areas of the world, see Pt 1, Ch 2,1.1. Due allowance is to be made for the ship's trials, work-up period and delivery voyages in the assignment of a service area notation. However special consideration may be appropriate to these periods in order to ensure that the ship is not subjected to dynamic loads which might impair the structural working life of the ship.

2.2.6 The wave environmental data for service areas **SA1**, **SA2**, **SA3** and **SA4** are specified in 2.3.

2.2.7 The Owner or builder should confirm that the chosen Service Area, the service area factor, f_s , and the wave environment characteristics as defined in 2.3 are appropriate for the intended areas of operation.

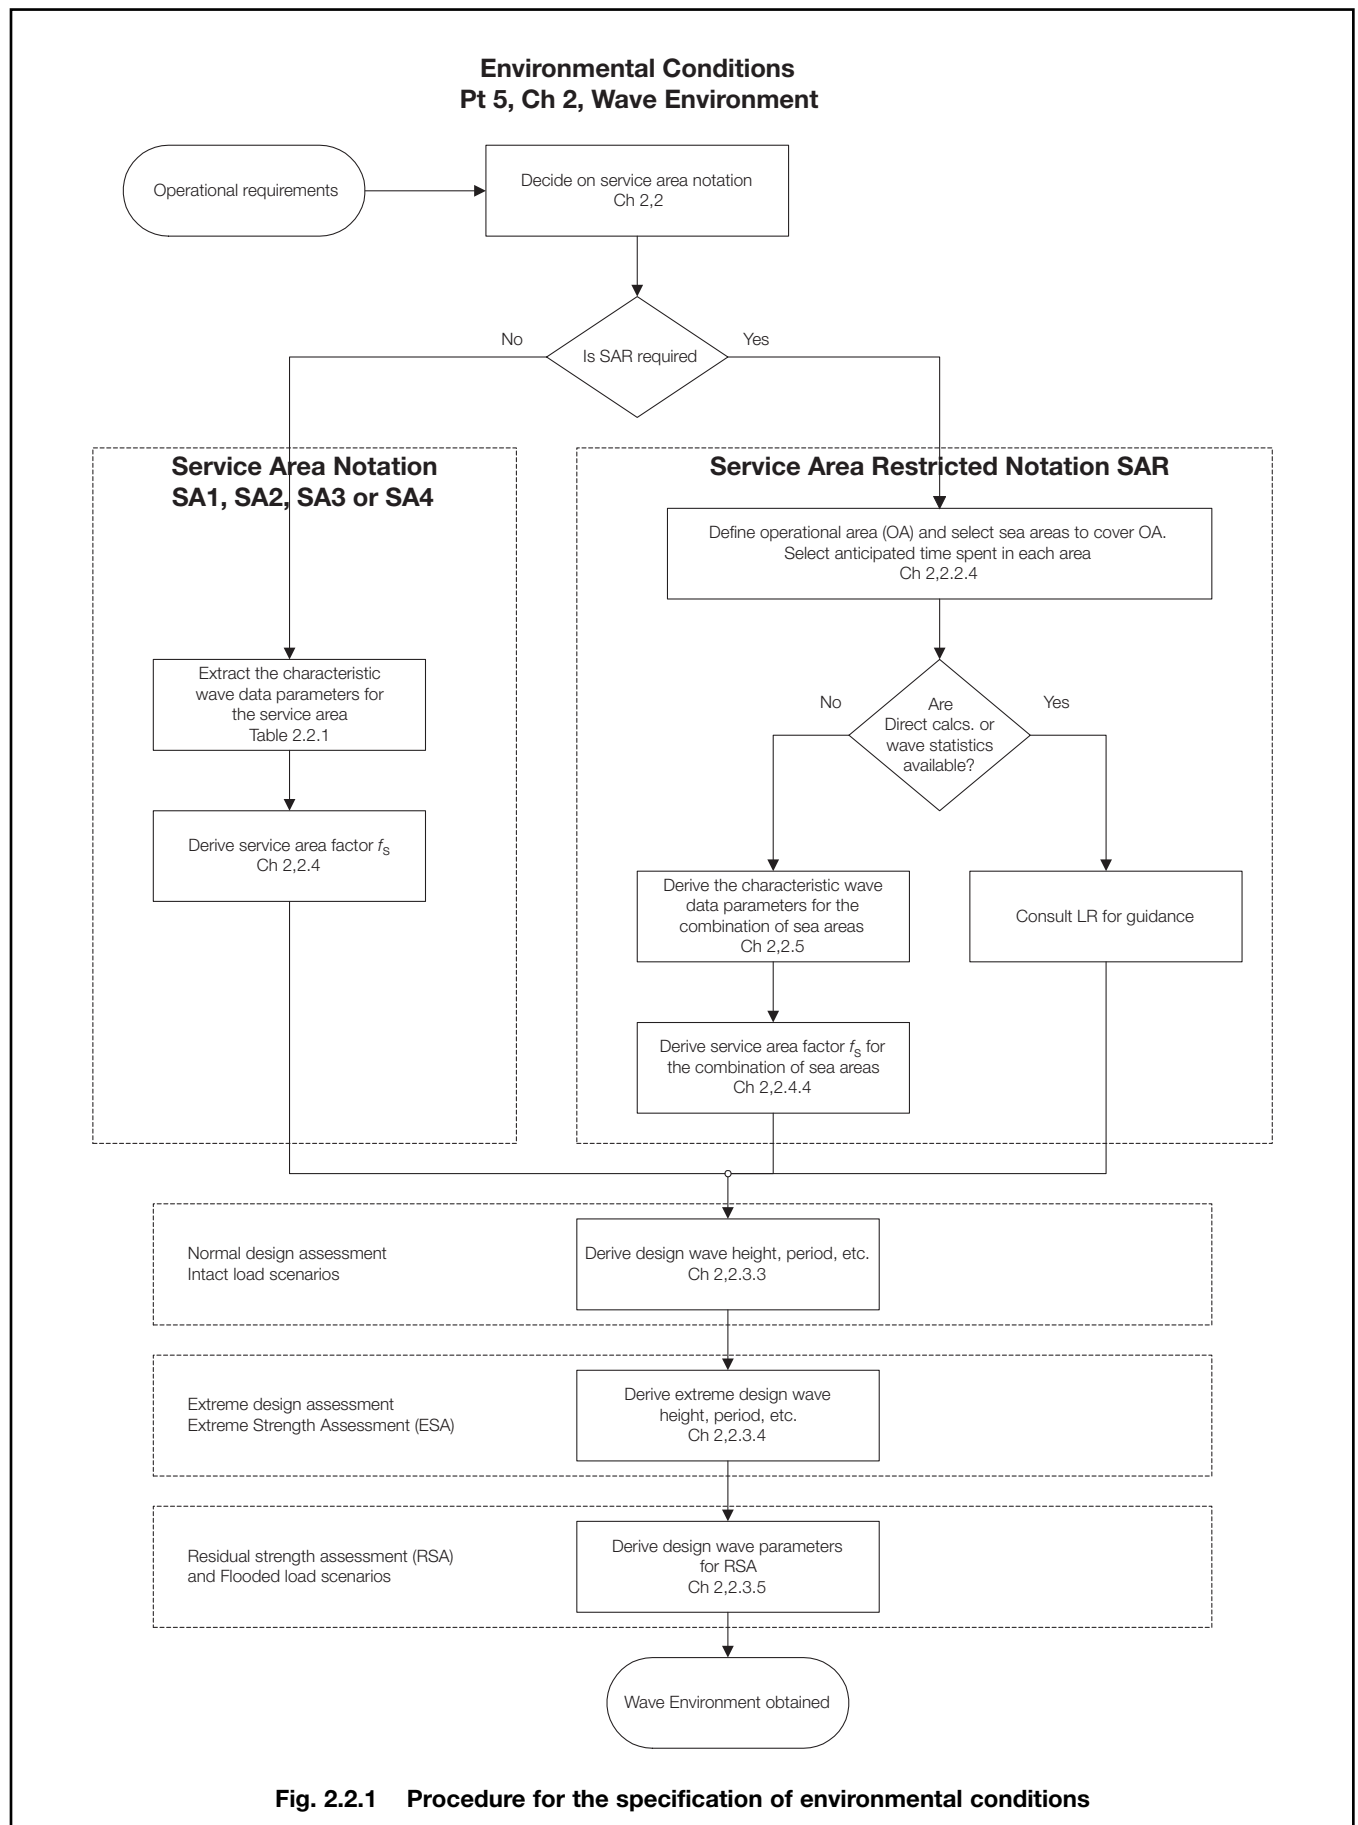

2.2.8 The allocation of a service area notation to a ship does not remove the responsibility of the master or commanding officer to take suitable measures to avoid typhoon, hurricane and other extreme weather conditions, as appropriate.

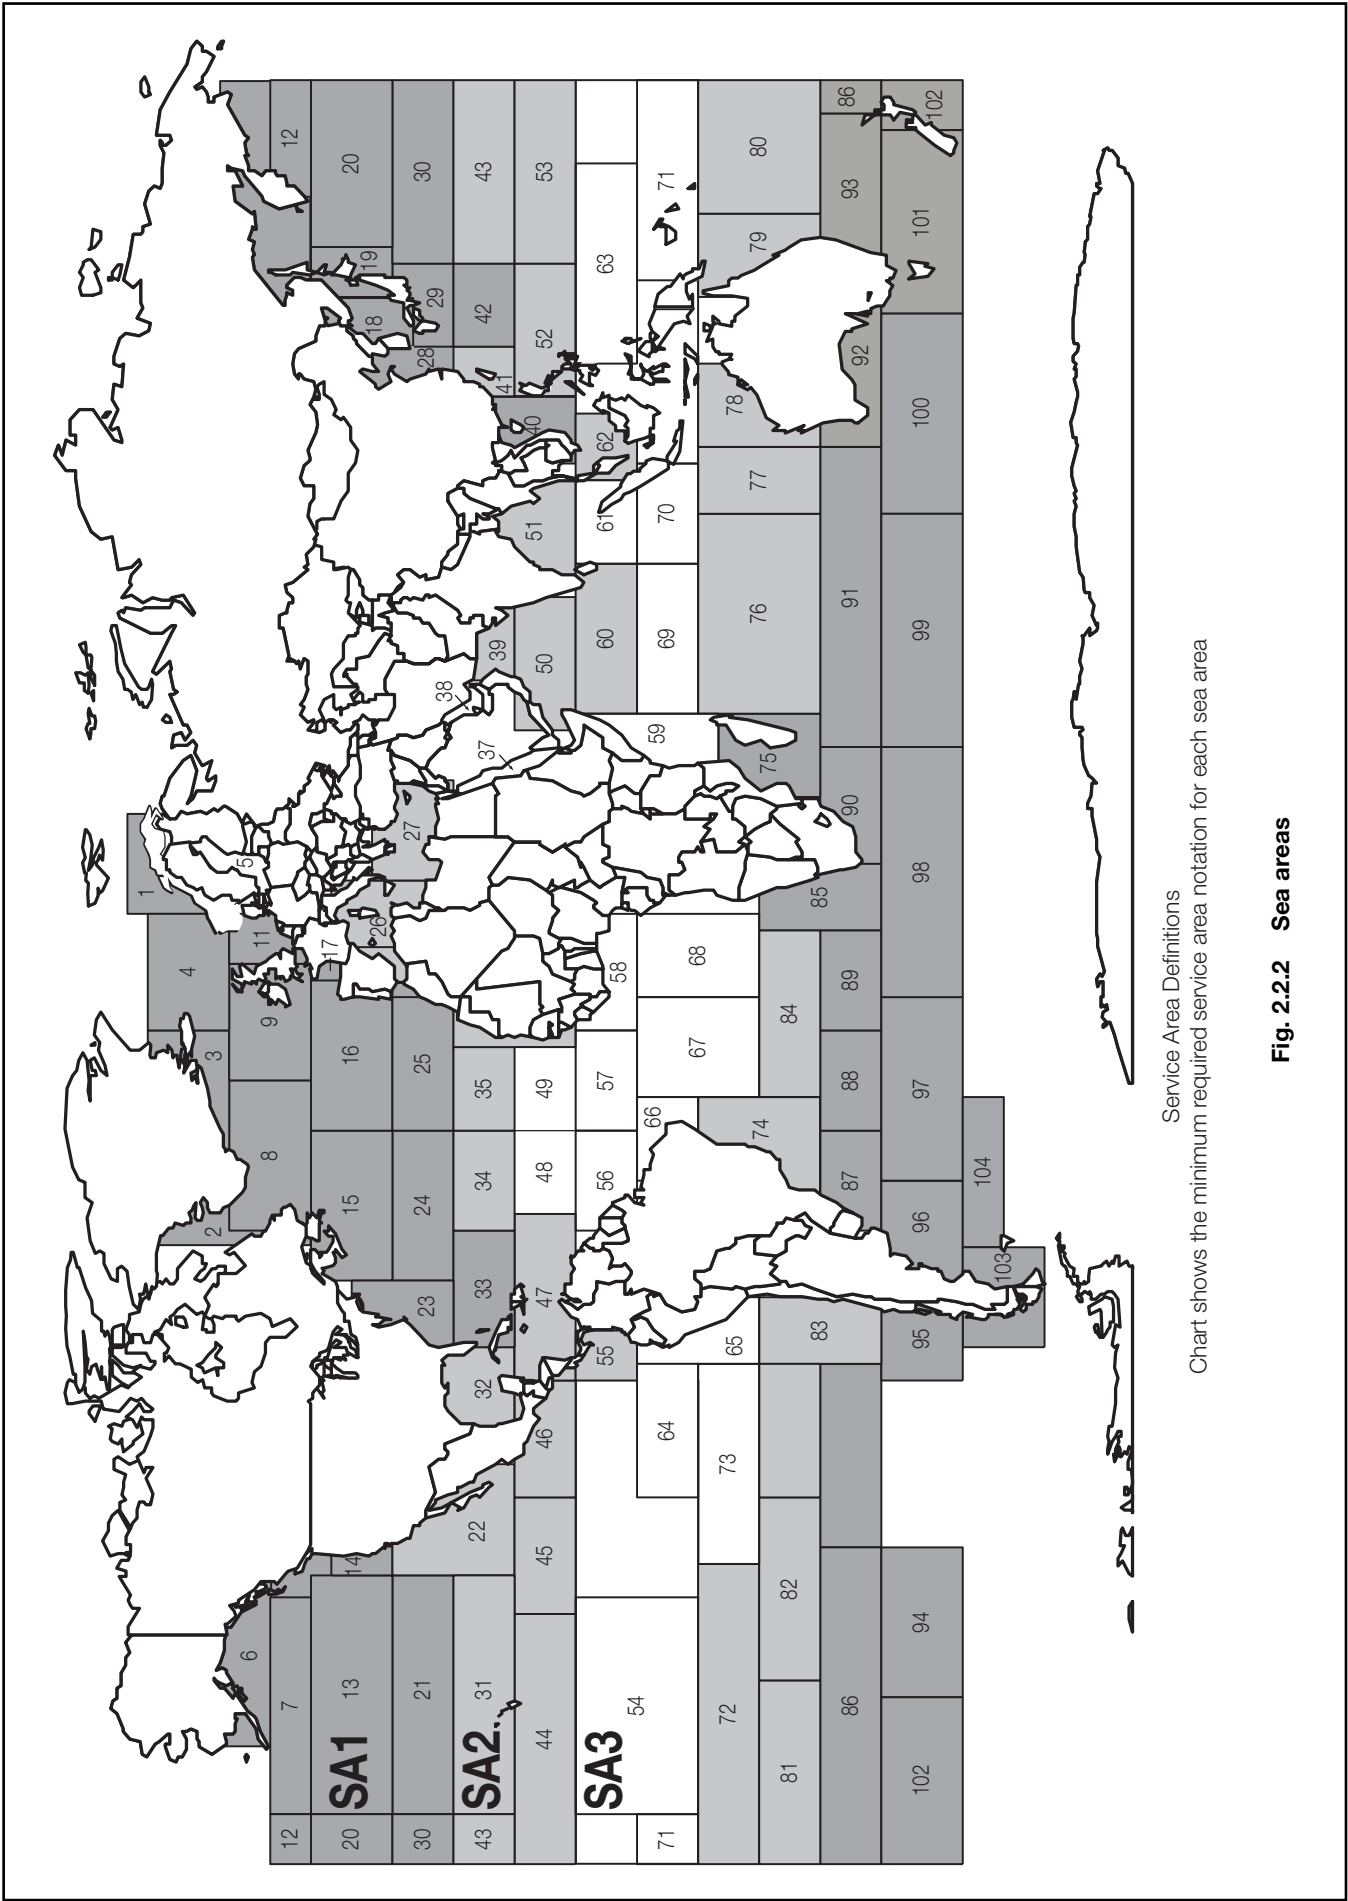

2.2.9 The requirements for ships which are required to maintain station or operate in typhoon, hurricane and other extreme weather conditions will be specially considered.

2.3 Wave environment

2.3.1 The environmental wave data for each service area notation is given in Table 2.2.1. Table 2.2.4 gives the environmental wave data for each individual sea area.

2.3.2 The definitions of wave height, wave period and wave period range given below are to be used in the determination of the environmental loads acting on the ship.

Environmental Conditions

Volume 1, Part 5, Chapter 2

Section 2

Table 2.2.1 Environmental wave data for each service area

Service Area Notation	Wave height for the service area, in metres	Mean wave period, in seconds	Standard deviation of wave period, in seconds	Extreme design wave height, in metres
	H_s	T_z	T_{sd}	H_x
SA1	5,5	8,0	1,7	18,5
SA2	4,0	7,0	1,7	13,5
SA3	3,6	6,8	1,7	9,5
SA4	2,5	6,0	1,5	6,0
SAR	To be specially considered			
NOTE See text and notes in Table 2.2.4 for definitions of all values.				

2.3.3 Wave environmental design criteria for normal design assessment. These design parameters have been used to derive the standard local and global environmental loadings in Chapters 3 and 4. All direct calculations and model tests required to supplement these loads are to use these environmental loadings.

Design wave height, H_{dw}

Average of the one hundredth highest observed wave heights for the service area. To be taken as:

$$H_{dw} = 1,67H_s \text{ m}$$

Design wave period, T_{dw}

Average zero crossing period of all seastates in the service area

$$T_{dw} = T_z \text{ seconds}$$

Standard deviation of wave period, T_{dsd}

Standard deviation of the zero crossing periods for the service area

$$T_{dsd} = T_{sd} \text{ seconds}$$

Design wave period range, T_{drange}

To be taken as the design wave period plus and minus 2 standard deviations of the zero crossing period, i.e.

$$T_{drange} \text{ is } T_{dw} - 2T_{dsd} \text{ to } T_{dw} + 2T_{dsd} \text{ seconds}$$

H_s , T_z and T_{sd} are given in 2.3.6.

2.3.4 Wave environmental design criteria for extreme design analysis, **ESA** notations. These design parameters have been used to derive the global environmental loadings in Chapter 4 which are used for the extreme strength assessment notation. All direct calculations and model tests required to supplement these loads are to use these environmental loadings.

Extreme wave height, H_{xw}

To be taken as the significant wave height that has a probability of 5×10^{-5} of being exceeded.

$$H_{xw} = H_x \text{ m}$$

Extreme wave period, T_{xw}

To be taken as the design wave period plus one standard deviation

$$T_{xw} = T_{dw} + T_{dsd} \text{ seconds}$$

Extreme wave period range, T_{xrange}

To be taken as the extreme design wave period plus and minus 1,5 standard deviations

$$T_{xrange} \text{ is } T_{xw} - 1,5T_{dsd} \text{ to } T_{xw} + 1,5T_{dsd} \text{ seconds}$$

Duration of extreme storm

It is to be assumed that extreme storm events are to persist for three hours.

T_{sd} and H_x are given in 2.3.6

T_{dw} and T_{dsd} is given in 2.3.3.

2.3.5 Wave environmental design criteria for residual strength analysis, **RSA** notations. These design parameters have been used to derive the global and local environmental loadings in Chapters 3 and 4 which are used for the residual strength assessment notation. All direct calculations and model tests required to supplement these loads are to use these environmental loadings.

Residual wave height, H_{rw}

To be taken as the significant wave height that has a 20 per cent probability of being exceeded for the service area

$$H_{rw} = 0,90H_s \text{ m}$$

Residual wave period, T_{rw}

To be taken as the standard design wave period

$$T_{dw} = T_z \text{ seconds}$$

Residual wave period range, T_{rrange}

To be taken as the standard design wave period range

$$T_{rrange} = T_{drange} \text{ seconds}$$

Duration of sea state

It is to be assumed that the duration of sea states of this magnitude is 12 hours.

H_s and T_z are given in 2.3.6

T_{drange} is given in 2.3.3.

2.3.6 The parameters used in above equations are given in Table 2.2.1 for service area notations **SA1**, **SA2**, **SA3** and **SA4**. For the restricted service area notation **SAR**, the values of H_s , T_z , T_{sd} and H_x will need to be derived, see 2.5.

2.4 Service Area factors

2.4.1 The service area factor, f_s , is used to derive the global hull girder loads in Chapter 4. The service area factor applicable for Service Area notations **SA1**, **SA2**, **SA3** and **SA4** is given by:

$$f_s = (f_1 + f_2 (L_{WL} - 100)/1000) f_{sl}$$

where

f_s is to have a minimum value of 0,5 and normally a maximum value of 1,0 and is to be rounded up to the nearest 0,05

f_{sl} is the service life factor as defined in 2.4.2

f_1 and f_2 are given in Table 2.2.2

L_{WL} is defined in Pt 3, Ch1,5.2.

2.4.2 The service life factor, f_{sl} , is based on a ship's operational life. This factor may need to be increased for service lives which are predicted to require significantly more wave encounters. The service life factor is to be taken as follows:

$$\begin{aligned} f_{sl} &= 1,0 \text{ for } 1 \times 10^8 \text{ wave encounters (20 years)} \\ &= 1,010 \text{ for } 1,25 \times 10^8 \text{ wave encounters (25 years)} \\ &= 1,019 \text{ for } 1,5 \times 10^8 \text{ wave encounters (30 years).} \end{aligned}$$

Table 2.2.2 Environmental wave data for service area

Service Area Notation	Intercept factor f_1	Slope factor f_2
SA1	1,00	0,00
SA2	0,93	-1,15
SA3	0,70	-1,00
SA4	0,50	0,00
SAR	To be specially considered	

2.4.3 For unrestricted sea-going service, i.e. service area notation **SA1**, the service area factor is to be taken as 1,0.

2.4.4 Alternatively the service area factor may be derived by direct calculation of the long term hull girder loads, see Ch 4,1.3.

2.4.5 For restricted Service Area Notation **SAR** the service area factor is to be derived by combining the service areas factors for each sea area using the following formula:

$$f_s = \ln \left(\sum_{i=1}^n P_i e^{f_{si}} \right)$$

where

$$f_{si} = f_{1i} + f_{2i} (L_{WL} - 100) / 1000$$

f_{1i} and f_{2i} are the individual sea area factors given in Table 2.2.3

$$e = 2,7183$$

$\ln()$ is the natural log

P_i is defined in 2.5.3.

2.5 Derivation of wave statistics for a combination of sea areas

2.5.1 For the **SAR** restricted service area notation, it is necessary to derive the environmental wave data for the required area of operation. This data may be determined using statistical methods as specified in 2.6 or using the information given in this Section.

2.5.2 The following formulae may be used to derive the design wave statistics for a ship designed to operate with a particular service area restriction. These formulae enable the environmental wave data from a set of individual sea areas to be combined to give the appropriate design wave statistics for the **SAR** restricted service area notation, see also 2.2.

2.5.3 The environmental wave data for each sea area is given in Table 2.2.4. The extents of each sea area are shown in Fig. 2.2.2.

Wave height, H_s

H_s = weighted average of the wave height for all sea areas plus one standard deviation

$$= H_{sm} + \sqrt{\sum_{i=1}^n P_i (H_{si} - H_{sm})^2} \quad \text{m}$$

where

$$H_{sm} = \sum_{i=1}^n P_i H_{si} \quad \text{m}$$

Design wave period, T_{dw}

T_{dw} = weighted average of the wave period for all sea areas

$$= \sum_{i=1}^n P_i T_{zi} \quad \text{seconds}$$

Standard deviation of wave period, T_{sd}

T_{sd} = weighted average of the standard deviation for all sea areas about the combined design wave period, T_{dw}

$$= \sqrt{\sum_{i=1}^n P_i (T_{sdi}^2 + (T_{dw} - T_{zi})^2)} \quad \text{seconds}$$

Extreme wave height, H_x

H_x = weighted average of the extreme wave height for all sea areas plus one standard deviation

$$= H_{xm} + \sqrt{\sum_{i=1}^n P_i (H_{xi} - H_{xm})^2} \quad \text{m}$$

where

$$H_{xm} = \sum_{i=1}^n P_i H_{xi} \quad \text{m}$$

where

N is the number of sea areas

i is the sea area index reference

P_i is the probability of the ship operating in sea area i , i.e. the percentage of time, expressed as a probability value

H_{si} is the appropriate sea area wave height value for sea area i

H_{xi} is the appropriate extreme wave height value for sea area i

T_{zi} is the appropriate zero crossing period for sea area i

T_{sdi} is the appropriate standard deviation for sea area i

2.5.4 The designer/Builder is to supply full details of the **SAR** notation required together with full supporting calculations. All transit voyages and ship work-up/trial periods should be included in the list of sea areas if their inclusion results in a more severe wave environment, see also 2.2.5.

2.6 Direct calculations

2.6.1 The wave environmental parameters may be derived by direct calculation using long term statistical wave data for the selected area(s) of operation based on hindcast data or similar analysis. This data is to accurately represent the sea environment in the intended area of operation over a long period and enable sound long term and extreme short term statistics to be derived. Depending on the area of operation, due account is to be taken of typhoon, hurricane and other seasonal extremes, see also 2.2.8.

Environmental Conditions

2.6.2 The derivation of the wave environmental parameters is to be in accordance with the data specification and methods given in 2.3. The areas used for the direct calculation will then be specified after the **SAR** service area restriction notation.

NOTES

1. The sea area wave height H_{Si} and wave zero crossing period, T_{Zi} , are based on the annual, all directions wave data scatter diagram.
2. The sea area wave height H_{Si} is the average of the one third highest observed (or significant) wave heights in the wave scatter diagram.
3. The T_{Zi} and standard deviation of T_{Sdi} are derived using all wave heights in the wave data scatter diagram.
4. The extreme design wave height, H_{Xi} , is based on a Gumbel projection using the following data set definition:
A wave data scatter diagram based on integer parts per ten thousand. (Note using a higher precision scatter diagram will result in a higher estimate of extreme wave height).
Probability of exceedance of 5×10^{-5} , roughly equivalent to 6,5 years continuously at sea in each sea area.
5. The values of H_{Si} , T_{Zi} , and T_{Sdi} were derived from the data set used for the extreme wave height.

Environmental Conditions

Volume 1, Part 5, Chapter 2

Sections 3 & 4

Section 3 Air environment

3.1 Wind speed

3.1.1 For design purposes a wind speed of 40 m/s is to be assumed.

3.2 Design air temperature

3.2.1 The design air temperature is to be taken as 2°C lower than the lowest mean daily average air temperature in the area of operation:

where

Mean = statistical mean over a minimum of 20 years (MDHT)

Average = average during one day and one night (MDAT)

Lowest = lowest during the year (MDLT).

Fig. 2.3.1 shows the definition graphically.

Fig. 2.3.1 Design air temperature

Section 4 Guidance for ice environment

4.1 General

4.1.1 This Section is intended to give guidance on the selection of a suitable ice class notation for the operation of naval ships in Arctic and Antarctic regions.

4.1.2 The Owner is to confirm which notation is most suitable for their requirements. Ultimately the responsibility rests with the commanding officer and their assessment of the ice and temperature conditions at the time.

4.1.3 The documentation supplied to the ship is to contain the ice class notation adopted, any operation limits for the ship and guidance on the type of ice that can be navigated for the nominated ice class.

4.2 Definitions

4.2.1 The World Meteorological Organisation's, WMO, definitions for sea ice thickness are given in Table 2.4.1.

Table 2.4.1 WMO definition of ice conditions

Ice conditions	Ice thickness
Medium first year	1,2 m
Thin first year, second stage	0,7 m
Thin first year, first stage	0,5 m
Grey-white	0,3 m
Grey	0,15 m

4.2.2 Table 2.4.2 defines the ice classes in relation to the Rules and the equivalent Internationally recognised Standards.

Table 2.4.2 Comparison ice standards

Lloyd's Register class notation	Finnish-Swedish Ice-Due class	Canadian type
1AS	IA Super	A
1A	IA	B
1B	IB	C
1C	IC	D
1D	ID	—
none	none	E

4.2.3 Extended periods are defined as those that involve the vessel remaining in air temperatures below 0°C for more than one week.

4.3 Application

4.3.1 For naval ships intended for extended periods of operation in Arctic and Antarctic areas the suggested ice class is **1C**. For these operational limits, the materials used for hull construction are to be in accordance with Pt 6, Ch 6.2. If a higher ice class is proposed, material requirements are to be specially considered using a specified design air temperature as defined in 3.2.

4.3.2 For naval ships required to operate in multi year ice as defined by the Ice breaker region in Fig. 2.4.1 without an ice breaker escort, the requirements for ice class will be specially considered. Material requirements are to be in accordance with Pt 6, Ch 6,2 using a specified design air temperature as defined in 3.2.

4.3.3 The variable nature of ice conditions is such that the average limits of the conditions are not easily defined. However, it is possible to plot the probable limits of the ice flows and the ice edge for each season. Operation with Ice Class **1C** may be possible up to 150 nm inside the 7/10 region shown depending on the severity of the winter. Operation with Ice Class **1A** may be possible up to 150 nm inside the medium first year ice shown depending on the severity of the winter. Operation up to the multi year ice is possible most years with Ice Class **1AS**.

4.3.4 Operation in the region between 7/10 and 1/10 in the arctic is possible with due care for ships with no ice class. For ships operating for extended periods in these areas it will be necessary to specify and design for a minimum temperature for the hull materials. To cover all situations for a non-ice class ship, the material requirements of Pt 6, Ch 6,2 are recommended.

4.4 Ice Class notations

4.4.1 Where the requirements of Vol 3, Pt 1, Ch 1 are complied with, the ship will be eligible for a special features notation as defined in Pt 1, Ch 2,3.8.

4.5 National Authority requirements

4.5.1 Certain areas of operation may require compliance or demonstration of equivalence with National Authority requirements. Table 2.4.2 gives the equivalence of National Authority requirements.

4.5.2 The standards of ice strengthening required by the Rules have been accepted by the Finnish and Swedish Boards of Navigation as being such as to warrant assignment of the Ice-Due Classes given in Table 2.4.2. For definition of Ice-Due Classes, see *Finnish-Swedish Ice Class Rules, 1985*.

4.5.3 Ships intending to navigate in the Canadian Arctic must comply with the Canadian Arctic Shipping Pollution Prevention Regulations established by the Consolidated Regulations of Canada, 1978, Chapter 353, in respect of which Lloyd's Register is authorised to issue Arctic Pollution Prevention Certificates.

4.5.4 The Canadian Arctic areas have been divided into zones relative to the severity of the ice conditions experienced and, in addition to geographic boundaries, each zone has seasonal limits affecting the necessary ice class notation required to permit operations at a particular time of year. It is the responsibility of the Owner to determine which notation is most suitable for their requirements.

4.6 Ice accretion

4.6.1 For ships intended to operate for extended periods in Arctic or Antarctic the build up of ice on exposed surfaces is to be considered. See Ch 3,7 and Ch 4,2.

4.6.2 As a minimum a full icing allowance is to be applied to vessels operating in the following areas, see Fig. 2.4.2.

- The area north of latitude 65°30'N, between longitude 28°W and the West coast of Iceland; north of the north coast of Iceland; north of the rhumb line running from latitude 66°N, longitude 15°W to latitude 73°30'N, longitude 15°E, north of latitude 73°30'N between longitude 15°E and 35°E, and east of longitude 35°E, as well as north of latitude 56°N in the Baltic Sea.
- The area north of latitude 43°N bounded in the west by the North American coast and the east by the rhumb line running from latitude 43°N, longitude 48°W to latitude 63°N, longitude 28°W and thence along longitude 28°W.
- All sea areas north of the North American continent west of the areas defined in subparagraphs above.
- The Bering and Okhotsk Seas and the Tartary Strait during the icing season.
- South of latitude 60°S.

4.6.3 A full icing allowance is defined as an additional pressure of 1 kN/m² (100 mm of ice) applied to all exposed horizontal or near horizontal surfaces and 0,25 kN/m² (25 mm of ice) applied to all exposed vertical surfaces. The volumetric centre of the ice is to be taken as that of an equivalent head of water. The density of the ice is assumed to be 1000 kg/m³.

4.6.4 As a minimum a half icing allowance is to be applied to vessels operating in the winter seasonal areas as defined in the International Load Line Convention.

4.6.5 A half icing allowance is defined as an additional pressure of 0,5 kN/m² (50 mm of ice) applied to all exposed horizontal or near horizontal surfaces and 0,18 kN/m² (18 mm of ice) applied to all exposed vertical surfaces. The volumetric centre of the ice is to be taken as that of an equivalent head of water. The density of the ice is assumed to be 1000 kg/m³.

4.6.6 The effects on stability of ice accretion are to be assessed in accordance with the stability standard identified by the Naval Authority.

4.6.7 Where alternative icing allowances are specified by the Naval Authority and these allowances exceed that defined in 4.6.3 and 4.6.5 for the appropriate operational areas, these allowances shall be used in the assessment of the local and global structure.

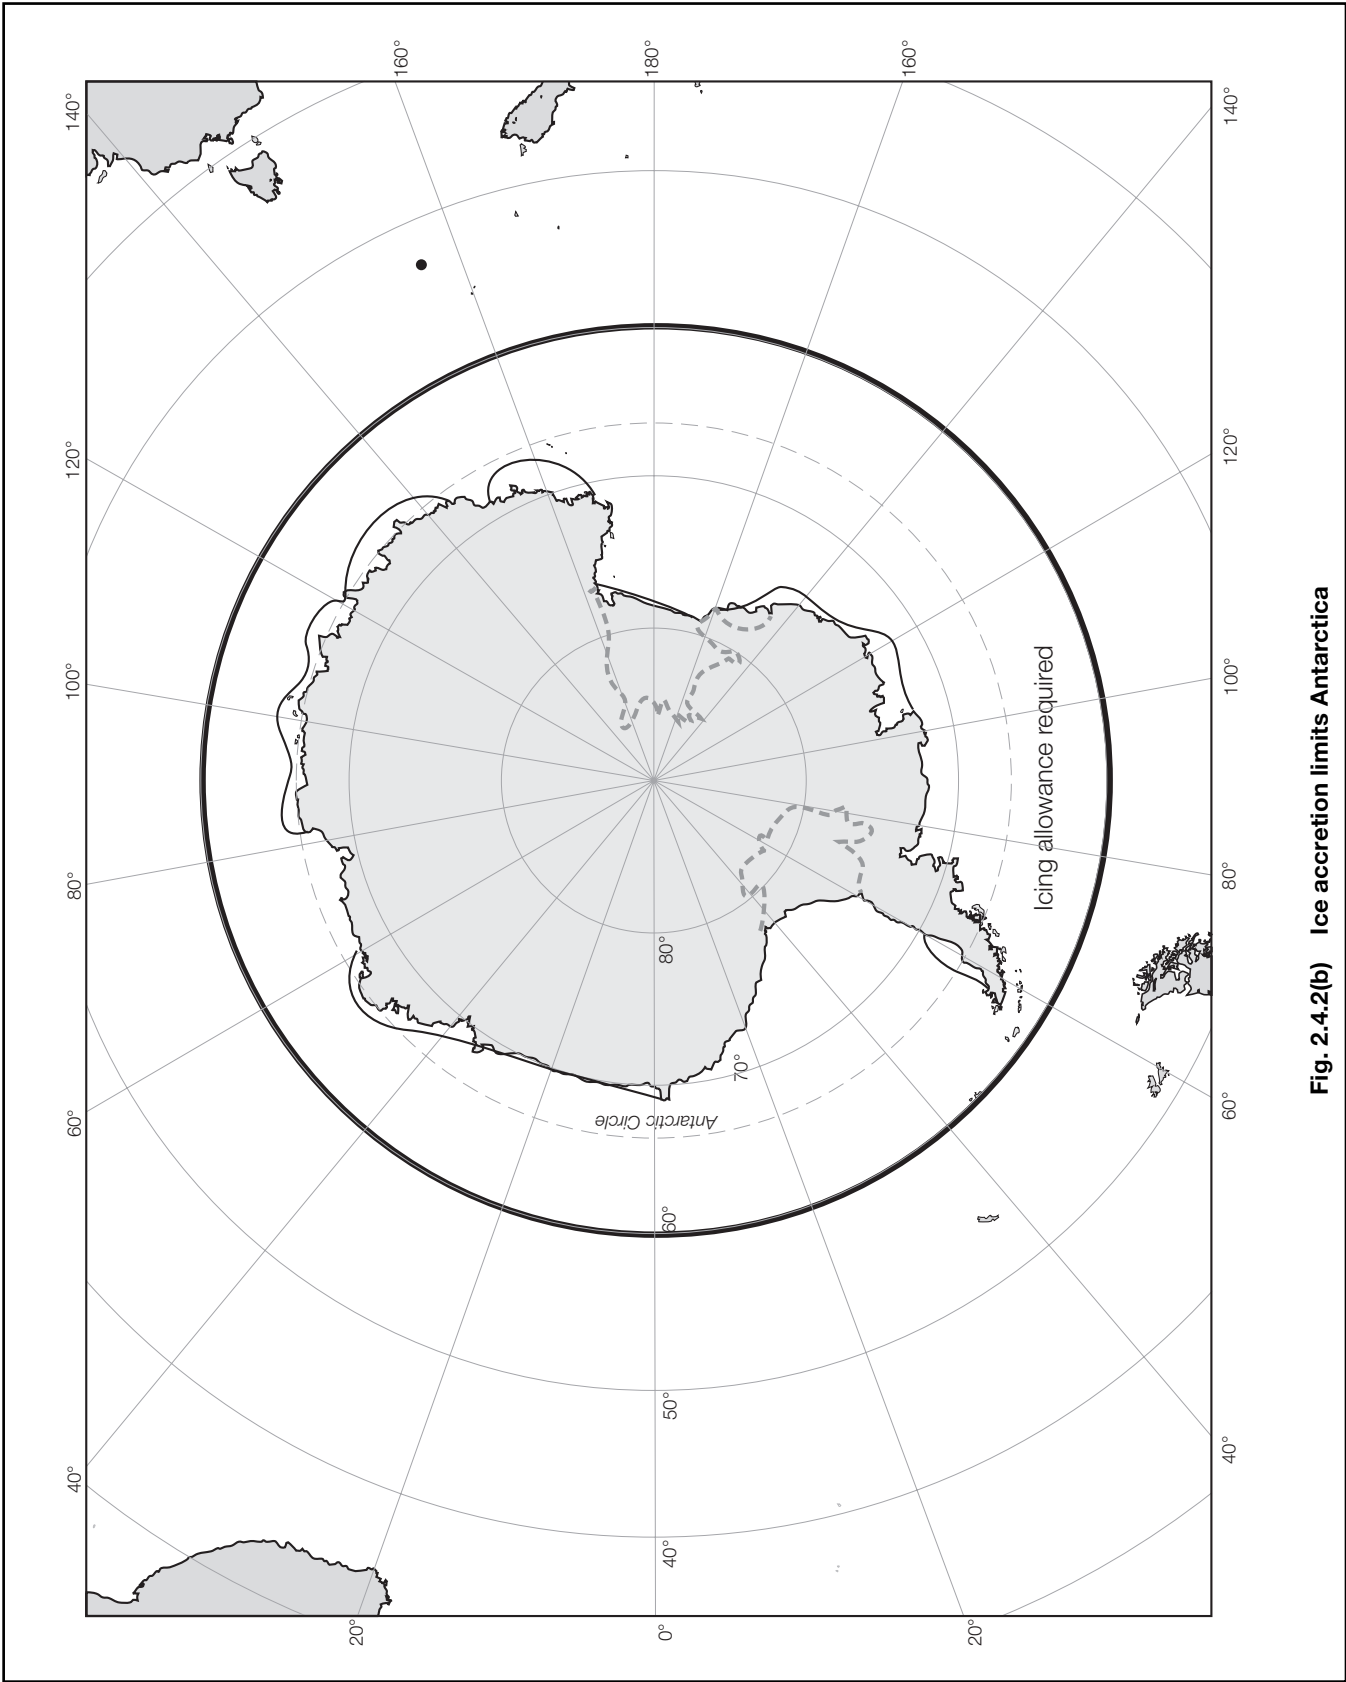

Fig. 2.4.2(b) Ice accretion limits Antarctica

4.7 Ice conditions

4.7.1 Charts and images for the current and recent ice conditions in all areas of the world plus information on icebergs can be found from the National Ice Centre on the world wide web at

<http://www.natice.noaa.gov/>.

Information is supplied by regular assessment and survey by the naval ice centres patrols.

4.7.2 Daily ice information and consultation is available from the Canadian ice service which is part of the Canadian department of the environment. Their web site can be found at

[http// www.ice-glaces.ec.gc.ca](http://www.ice-glaces.ec.gc.ca).

Local Design Loads

Volume 1, Part 5, Chapter 3

Section 1

Section

- 1 **Introduction**
- 2 **Motion response**
- 3 **Loads on shell envelope**
- 4 **Impact loads on external plating**
- 5 **Local design loads for decks and bulkheads**
- 6 **Other local loads**
- 7 **Ice loads**

Section 1 Introduction

1.1 General

1.1.1 This Chapter contains information regarding the derivation of local design loads that are to be used for the assessment of scantlings to local loads as specified in Pt 6, Ch 2.

1.1.2 The formulae for ship motion loads given in this Chapter are suitable for all ships that operate in the displacement mode. Ship motion loads for ships that operate in the fully planing mode will need to be specially considered.

1.1.3 Fig. 3.1.1 gives an overview of the contents of this Chapter, the locations of the local load components and the route through the Chapter.

1.2 Environmental conditions

1.2.1 The environmental conditions for the determination of the local loads are to be based on the normal environmental design criteria specified in Pt 5, Ch 2,2.3 unless otherwise stated.

1.2.2 The wave height factor for local loads, f_{Hs} , is dependent on the service area notation and is to be taken as follows:

$f_{Hs} = 1,0$ for SA1 service area notation, i.e. unrestricted sea-going service

otherwise

$$f_{Hs} = \frac{\text{design wave height for the restricted service}}{\text{design wave height for unrestricted service}}$$

$$= \frac{H_{dw}}{H_{dw} \text{ for SA1}}$$

f_{Hs} is not to be taken as less than 0,5
 H_{dw} is given in Ch 2,2.3.3.

1.2.3 All other environmental parameters are defined in Chapter 2.

1.2.4 The local design loads for assessment of the residual strength notation, **RSA**, or for special loading conditions where the ship will not experience severe weather or severe seastates may be adjusted for the appropriate environmental conditions. A reduced wave height factor, f_{Hs} , may be applied, see 5.10 and Pt 5, Ch 3,5.10.3.

1.3 Symbols and definitions

1.3.1 The symbols and definitions applicable to this Chapter are defined below or in the appropriate sub-Section.

L_{WL} , B , B_{WL} , D , T and C_b are defined in Pt 3, Ch 1,5.2

f_{Hs} = wave height factor for service area, see 1.2.2

V_{cr} = two thirds the cruising speed, in knots

V_{sp} is to be taken as the greater of the cruising speed or two thirds the sprint speed, in knots. For ships where it is not required to maintain high speeds in severe weather then the value of V_{sp} may be specially considered

T = mean draught at midships to the design waterline, based on L_{WL} , measured from the baseline

T_x = local draught to design waterline at longitudinal position under consideration measured above the baseline is to be taken as the horizontal plane passing through the bottom of the moulded hull at midships, see Fig. 3.1.2

x_{wl} = longitudinal distance, in metres, measured forwards from the aft end of the L_{WL} to the position or centre of gravity of the item being considered

y = transverse distance, in metres, from the centreline to the centre of gravity of the item being considered. y is positive to port and negative to starboard

z = vertical distance, in metres, from the base line to the position or centre of gravity of the item being considered. z is positive above the baseline

Normally the following definitions are to be applied: For a longitudinally framed plate panel, z is to be taken at the panel centre

For a transversely framed plate panel, z is to be taken at two thirds of the panel height

For short stiffener members: z is to be taken at the stiffener mid position

For long stiffener members: z is generally to be taken at the stiffener mid position, but may need to be specially considered, especially when there is a significant pressure variation along its length

z_k = vertical distance of the underside of the keel above the baseline, in metres, see Fig. 3.1.2

Δ = moulded displacement of the ship, in tonnes.

1.3.2 **Froude Number F_n .** The Froude number is a non-dimensional parameter which is the primary constituent part of the wave making resistance and which dictates the maximum displacement speed. It is defined as:

$$F_n = \frac{V_m}{\sqrt{g L_{WL}}}$$

where

g is the acceleration due to gravity and is taken to be 9,81 m/s²

L_{WL} is defined in 1.3.1

V_m is the appropriate ship speed in m/s.

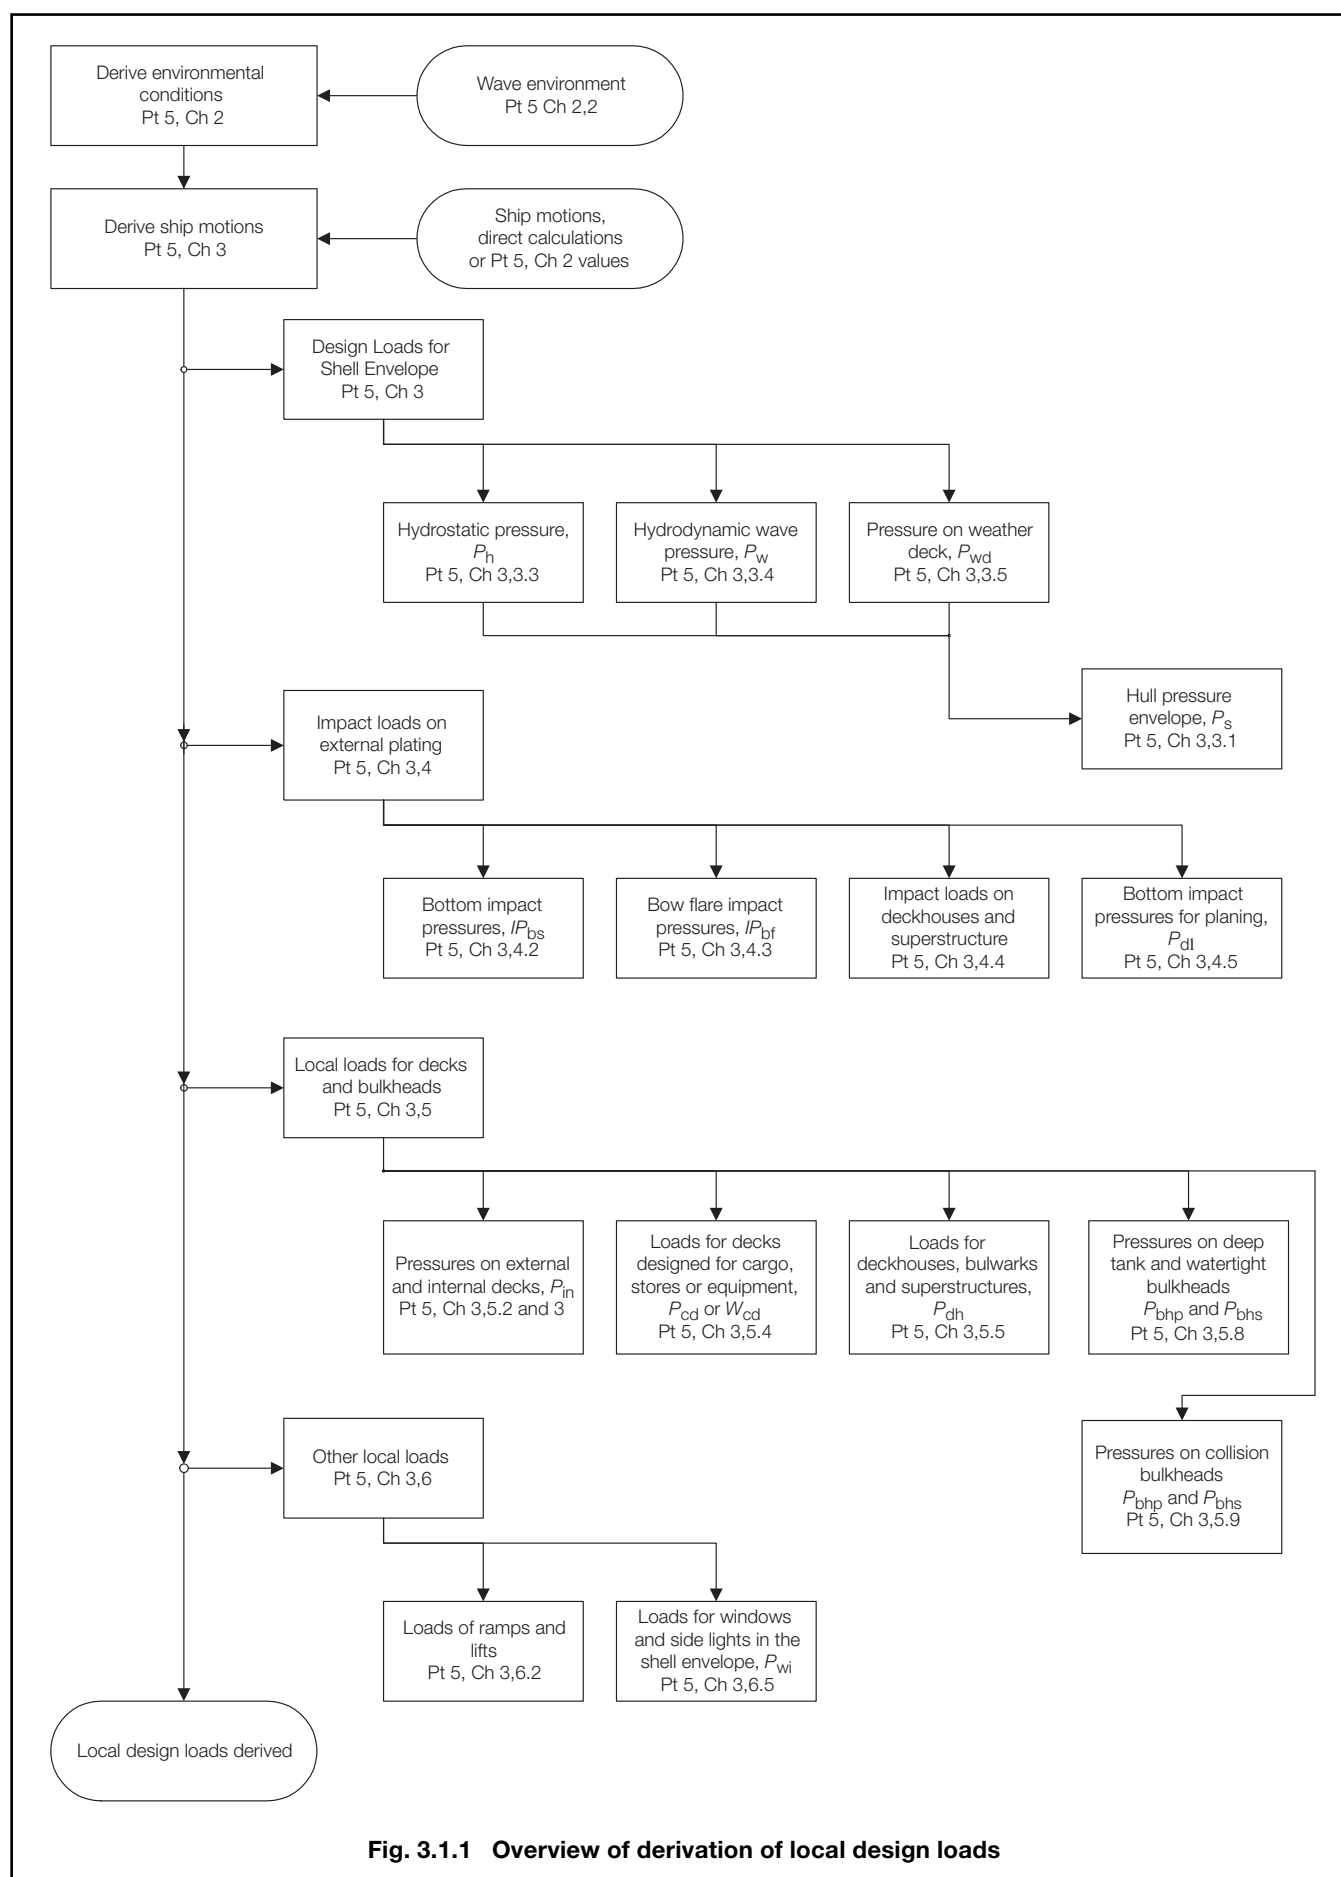

Fig. 3.1.1 Overview of derivation of local design loads

Fig. 3.1.2 Definition of draft T and baseline

1.3.3 Design loading condition. The design loading condition is to be taken as the normal operating deep draft condition with tanks and consumables, etc in the departure state. Where there is a significant variation in loading conditions or operating modes, then it may be necessary to consider additional loading conditions which represent the extremes of service requirements. For example:

- a ship which can operate in displacement and non-displacement modes;
- a ship which is required to operate at a much deeper draft than the normal seagoing draft for off-loading payload;
- a ship which is required to be involved in humanitarian emergency evacuation incidents or similar situations where short term overloading may be necessary.

1.3.4 LCG. The LCG is the longitudinal centre of gravity of the ship measured in metres from the aft end of the L_{WL} for the design loading condition.

1.3.5 Displacement mode. Displacement mode means the regime, whether at rest or in motion, where the weight of the ship is fully or predominantly supported by hydrostatic forces. Typically this applies to craft with a Taylor Quotient, Γ , less than 3. However, some craft are designed to plane with Γ less than 3 and these should be considered as operating in the non-displacement mode.

1.3.6 Fully planing mode or Non-displacement mode. Non-displacement mode means the normal operational regime of a ship when non-hydrostatic forces substantially or predominantly support the weight of the ship. Typically this applies to craft with a Taylor Quotient, Γ , greater than 3. However, some craft are designed not to plane with Γ greater than 3 and these should be considered as operating in the displacement mode unless they are classified as a high speed craft.

1.3.7 Taylor Quotient Γ . The Taylor Quotient is defined as:

$$\Gamma = \frac{V_m}{\sqrt{L_{WL}}}$$

where

V_m is defined in 1.3.2
 L_{WL} is defined in 1.3.1.

Section 2

Motion response

2.1 General

2.1.1 The motions of the ship are to be considered in deriving the dynamic loads acting on the ship. The formulae given in this Section may be utilised or ship motion design values may be derived by direct calculation methods or model testing.

2.1.2 For the assessment of mass inertial forces acting on structure the following combinations of static and dynamic forces are to be considered:

- Rolling motion only:
Static roll + dynamic roll + dynamic heave (at roll angle)
- Pitching motion only:
Static pitch + dynamic pitch + dynamic heave (at pitch angle)
- Combined motion:
Static combined +0,8 (dynamic roll + dynamic pitch)

Full details of the load cases applied are to be submitted for approval.

2.2 Ship motions

2.2.1 The ship motion response data given in Table 3.2.1 are to be used in the design calculations. Alternatively, the ship motion responses may be derived by direct calculation or equivalent methods.

2.3 Design accelerations

2.3.1 The non-dimensional ship motion acceleration values given in this Section are to be used in the design calculations. The equations given here are applicable to ships with conventional hull forms operating in the displacement mode at their normal ship service speed or cruising speed. It is not normally necessary to consider the ship motion or acceleration values at sprint speeds unless there is a particular requirement to operate at sprint speeds in severe seastates.

2.3.2 The following formulae are given as guidance for the components of acceleration due to ship motions and apply for ships with a length exceeding 50 m and where the speed is such that the ship is operating within the displacement mode based on normal ship service speed. Typically this will apply to most ships with displacement hull forms that are not designed to operate in the planing regime.

Vertical acceleration due to heave, pitch and roll motions

$$a_z = \pm \sqrt{(a_{\text{heave}}^2 + a_{\text{pitch}}^2 + a_{\text{rollz}}^2)}$$

Transverse acceleration due to sway, yaw and roll motions

$$a_y = \pm \sqrt{(a_{\text{sway}}^2 + a_{\text{yaw}}^2 + a_{\text{rolly}}^2)}$$

Longitudinal acceleration due to surge motions

$$a_x = \pm a_0 \sqrt{(0,06 + A^2 - 0,25A)}$$

where

Local Design Loads

Volume 1, Part 5, Chapter 3

Section 2

Table 3.2.1 Ship motions

Motion			Acceleration
Heave		a_{heave}	$= a_0$
Pitch		a_{pitch}	$= a_0 \left(5,3 - \frac{45}{L_{\text{WL}}} \right) \left(\frac{x_{\text{WL}} - L_{\text{CG}}}{L_{\text{WL}}} \right) \left(\frac{0,6}{C_b} \right)^{0,75}$
Sway		a_{sway}	$= a_0 0,78$
Yaw		a_{yaw}	$= a_0 1,6 \left(\frac{x_{\text{WL}} - L_{\text{CG}}}{L_{\text{WL}}} \right)$
Roll	Acceleration due to Roll Vertical direction	a_{rollz}	$= a_0 \frac{0,6y K^{1,5}}{B_{\text{WL}}}$
Roll	Acceleration due to Roll Transverse direction	a_{rolly}	$= a_0 \sqrt{K} \left(1 + 0,6K \left(\frac{z - T}{B_{\text{WL}}} \right) \right)$
		a_0	$= f_{\text{Hs}} f_{\text{st}} \left(\frac{0,2V}{\sqrt{L_{\text{WL}}}} + \frac{34 - \left(\frac{600}{L_{\text{WL}}} \right)}{L_{\text{WL}}} \right)$
Relative vertical motion		H_{rm}	$= C_{\text{w,min}} \left(1 + \frac{k_r}{(C_b + 0,2)} \left(\frac{x_{\text{WL}}}{L_{\text{WL}}} - x_m \right)^2 \right)$
Symbols			
f_{st} = correction factor for long term (10^{-8}) acceleration value to average of the highest 1/100 acceleration values $= 0,8$ C_w = a wave head, in metres $= f_{\text{Hs}} 0,0771 L_{\text{WL}} (C_b + 0,2)^{0,3} e^{(-0,0044 L_{\text{WL}})}$ $C_{\text{w,min}} = \frac{C_w}{k_m} \sqrt{\frac{2,25}{k_r}}$ $k_m = 1 + \frac{k_r (0,5 - x_m)^2}{(C_b + 0,2)}$ $x_m = 0,45 - 0,6 F_n$ but x_m is not to be less than 0,2 $k_r = 2,25$ for the determination of pressure loads in Section 3 $k_r = 4,5$ for the determination of impact loads in Section 4			
V is appropriate design speed as follows: $V = V_{\text{Cr}}$ for determination of pressure in Section 3, local design loads in Section 5 and 6, and all other loads unless specifically noted $= V_{\text{sp}}$ for determination of impact loads in Section 4 $F_n = \frac{0,515V}{\sqrt{g L_{\text{WL}}}}$ $K = 1$ in general. For particular loading conditions and hull forms, determination of K according to the formula below may be necessary $K = 13 GM/B_{\text{WL}}$, but $\geq 1,0$ GM = metacentric height, in metres f_{Hs} and B_{WL} are defined in 1.3.1 L_{CG} is defined in 1.3.4			
NOTES 1. Heave motion is measured positive upwards. 2. Pitch motion is measured positive bow downwards. 3. Sway motion is measured positive to port. 4. Yaw motion is measured positive bow to port. 5. Roll motion is measured positive port side upwards.			

$$A = f_{\text{Hs}} f_{\text{st}} \left(0,7 - \frac{L_{\text{WL}}}{1200} + \frac{5(z - T)}{L_{\text{WL}}} \right) \left(\frac{0,6}{C_b} \right)$$

and
 a_x , a_y and a_z are the maximum dimensionless accelerations (i.e. relative to the acceleration of gravity) in the respective directions and are considered as acting separately for calculation purposes
 a_x measured positive in the forward direction
 a_y measured positive in the transverse direction to port
 a_z measured positive in the downwards direction, i.e. adds to g

NOTES:
 a_x includes the component due to static weight in the longitudinal direction due to pitching
 a_y includes the component due to static weight in the transverse direction due to rolling
 a_z does not include the component due to static weight
 a_0 , a_{heave} , a_{pitch} , a_{rollz} , a_{sway} , a_{yaw} , a_{rolly} and A are defined in Table 3.2.1
 f_{st} is defined in Table 3.2.1
 f_{Hs} is defined in 1.2.2
 T , L_{WL} , C_b and z are defined in 1.3.1.

2.4 Design vertical acceleration for ships in the planing regime

2.4.1 The design vertical acceleration for the derivation of bottom impact pressures for ships operating in the planing regime may be derived using the following Sections.

2.4.2 The non-dimensional vertical acceleration at the LCG, a_{op} , is defined as the average of the 1/100 highest accelerations and is to be taken as:

$$a_{op} = 5,66g \theta_B L_1 (H_1 + 0,084) (5 - 0,1\theta_D) F_n^2 10^{-3}$$

where

F_n = Froude number based on V_{sp} , where V_{sp} is defined in 1.3.1, F_n is defined in 1.3.2

g = acceleration due to gravity (9,81 m/sec²)

$L_1 = \frac{L_{WL} B_c^3}{B_{WL} \Delta}$, but $\frac{L_{WL}}{B_{WL}}$ is not to be taken as less than 3

$H_1 = \frac{H_{dw}}{B_{WL}}$ but not less than 0,2

B_c = breadth of hull between the chines or bilge tangential points at the LCG, as appropriate, in metres, see Fig. 3.2.1

H_{dw} = design wave height in metres, see Ch 2,2.3.3

θ_D = deadrise angle at the LCG, in degrees, but is not taken as greater than 30°, see Fig. 3.2.1

θ_B = running trim angle in degrees, but is not to be taken as less than 3°

B_{WL} , Δ and L_{WL} are defined in 1.3.1

LCG is defined in 1.3.4

NOTES:

- The bilge tangential point is defined as the tangential point of the bilge with an oblique line sloped at 50° to the horizontal at the LCG, see Fig. 3.2.1.
- For ships with no clearly defined deadrise angle at the LCG, the angle, in degrees, to the horizontal line at the LCG formed by joining the lowest point of the hull or underside of keel and the bilge tangential point is to be taken as the deadrise angle θ_D , see Fig. 3.2.1.
- For ships with hulls of asymmetric section, where the inner and outer deadrise angles differ, the smaller of the two angles is to be used.

2.4.3 Where the Froude number, F_n , is greater than 1,8, the motion response criteria are to be specially considered.

2.4.4 The vertical non dimensional acceleration, a_z , at any given distance x along the hull may be taken as:

$$a_z = a_{op} \left(1,0 - 0,32 \frac{(x_{wl} - L_{CG})}{L_{WL}} + 1,76 \left(\frac{x_{wl}^2 - L_{CG}^2}{L_{WL}^2} \right) \right)$$

where

a_z = is the vertical acceleration in terms of g

x_{wl} = distance from aft end of L_{WL} , in metres, to the point at which the vertical acceleration is calculated

L_{CG} is defined in 1.3.4.

Fig. 3.2.1 Definition of bilge tangential point

Section 3

Loads on shell envelope

3.1 Pressures on the shell envelope

3.1.1 The design pressures for the shell envelope including exposed decks are to include the effects of combined static and dynamic load components. In addition the effects of impact or slamming loads are also to be considered, but these may be treated separately, see Section 4.

3.1.2 The individual pressure components are given in 3.3 to 3.5 and the combined pressure to be applied to the shell envelope is given in 3.2. The pressure to be applied to exposed and weather decks is given in 3.5.

3.2 Combined hydrostatic and hydrodynamic pressure on the shell plating, P_s

3.2.1 The total pressure distribution, P_s , in kN/m² acting on the shell plating envelope due to hydrostatic and hydrodynamic pressures is illustrated in Fig. 3.3.1 and is to be taken as specified in Table 3.3.1.

3.3 Hydrostatic pressure on the shell plating, P_h

3.3.1 The pressure, P_h , acting on the shell plating up to the design waterline due to hydrostatic pressure is to be taken as:

$$P_h = 10 (T_x - (z - z_k)) \text{ kN/m}^2$$

where

T_x , z and z_k are defined in 1.3.

Local Design Loads

Volume 1, Part 5, Chapter 3

Table 3.3.1 Shell envelope pressure, P_s

Vertical location i.e. z value	Shell envelope pressure, P_s kN/m ²
for $z \leq T_x + z_k$ i.e. up to the design waterline	$P_h + P_w$
At $z = T_x + z_k + H_w$	P_d
At $z \geq T_x + z_k + 1,5H_w$	$0,5P_d$
Symbols	
P_h is the hydrostatic pressure, see 3.3 P_w is the hydrodynamic wave pressure, see 3.4 P_d is the weather deck pressure, see 3.5.2 H_w is the nominal wave limit height, see 3.4.4 P_h and P_w are to be derived at the appropriate vertical position, z T_x , z and z_k are defined in 1.3	
NOTE Pressure values at other z values are to be derived by interpolation.	

3.4 Hydrodynamic wave pressure, P_w

3.4.1 The hydrodynamic wave pressure distribution, P_w , around the shell envelope up to the design waterline, i.e. $z \leq T_x + z_k$, is to be taken as the greater of the following:

P_m kN/m² (relative motion)

P_p kN/m² (pitching motion)

where

P_m and P_p are defined in 3.4.2 and 3.4.3.

3.4.2 The distribution of hydrodynamic pressure up to the design waterline, P_m , due to relative motion is to be taken as:

$$P_m = 10 f_z H_{rm} \text{ kN/m}^2$$

where

f_z = the vertical distribution factor

$$= k_z + (1 - k_z) \left(\frac{z - z_k}{T_x} \right)$$

$k_z = e^{-u}$

$$u = \left(\frac{2\pi T_x}{L_{WL}} \right)$$

H_{rm} is defined in Table 3.2.1

z , z_k , T_x and L_{WL} are defined in 1.3.

3.4.3 The distribution of hydrodynamic pressure up to the design waterline due to pitching motion, P_p , is to be taken as:

$$P_p = 10 H_{pm} \text{ kN/m}^2$$

where

$$H_{pm} = 1,1 f_{Hs} \left(\frac{2x_{wl}}{L_{WL}} - 1 \right) \sqrt{L_p}$$

but not less than $0,3f_{Hs} \sqrt{L_{WL}}$

where

$$L_p = L_{WL} \text{ but } \leq 150 \text{ m}$$

x_{wl} , L_{WL} and f_{Hs} are defined in 1.3.

3.4.4 The nominal wave limit height, H_w , above the design draft, T_x , is to be taken as:

$$H_w = 2 H_{rm} \text{ m}$$

where

H_{rm} is given in Table 3.2.1.

3.5 Pressure on exposed and weather decks, P_{wd}

3.5.1 The pressure acting on weather decks, exposed decks or decks designed for prolonged immersion, P_{wd} , is illustrated in Fig. 3.3.2 and is to be taken as specified in Table 3.3.2.

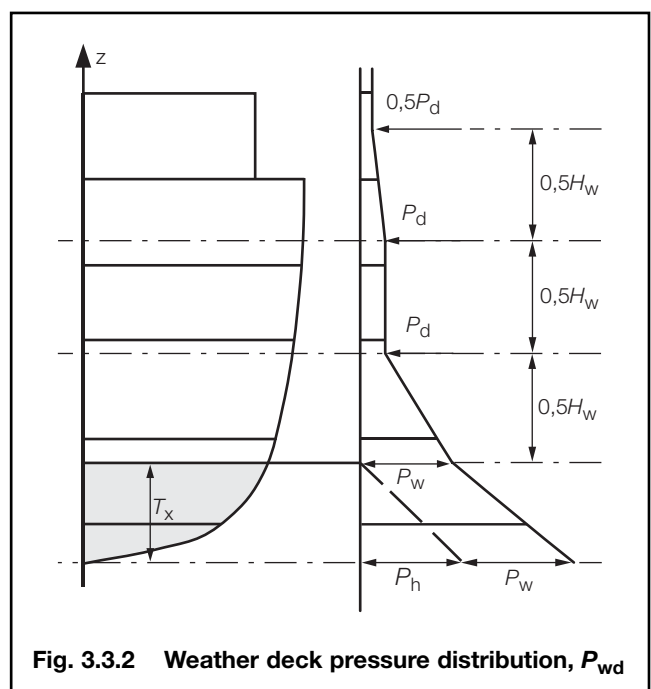

Fig. 3.3.2 Weather deck pressure distribution, P_{wd}

Local Design Loads

Volume 1, Part 5, Chapter 3

Sections 3 & 4

Table 3.3.2 Exposed/weather deck pressure, P_{wd}

Vertical location i.e. z value	Exposed/weather deck pressure, P_{wd} kN/m ²
for $z \leq T_x + z_k$ i.e. up to the design waterline	$P_h + P_w$
At $z = T_x + z_k + 0,5H_w$	P_d
At $z = T_x + z_k + 1,0H_w$	P_d
At $z \geq T_x + z_k + 1,5H_w$	$0,5P_d$
Symbols	
P_h is the hydrostatic pressure, see 3.3 P_w is the hydrodynamic wave pressure, see 3.4 P_d is the weather deck pressure, see 3.5.2 H_w is the nominal wave limit height, see 3.4.4 P_h and P_w are all taken at the appropriate vertical position, z T_x , z and z_k are defined in 1.3	
NOTE Pressure values at other z values are to be derived by interpolation.	

3.5.2 The minimum design pressure for weather decks, P_d , above the $0,5H_w$ limit line and below the $1,0H_w$ limit line is to be taken as:

$$P_d = 6 + 6f_L f_{Hs} \text{ kN/m}^2$$

where

$$f_L = \text{a location factor}$$

$$= 1 + 4 \left(\frac{x_{wl}}{L_{WL}} - 0,75 \right)$$

but not less than 1,0

L_{WL} and x_{wl} are defined in 1.3

f_{Hs} is defined in 1.2.

3.5.3 If a bulwark is fitted at the deck edge then consideration will be given to allowing the height of the top of the bulwark to be used for the pressure calculation.

Section 4 Impact loads on external plating

4.1 General

4.1.1 The effects of impact or slamming loads on the shell envelope are to be considered. This Section gives formulations for equivalent design pressure loads. Alternatively the impact pressure loads may be derived using suitable direct calculation methods.

4.1.2 The methods below produce average instantaneous impact pressures which need to be converted to equivalent static pressures by application of a dynamic load factor, see Pt 6, Ch 2,5 and Pt 6, Ch 3, Sections 14 and 15.

4.1.3 These methods are based on the Ochi-Motter slamming approach and are equivalent to the standard direct calculation procedure. The values of m_0 , variance of the relative vertical motion, and m_1 , variance of the relative vertical velocity, may be derived using direct calculations. In this case the variances are to be based on seastates as defined by the normal design assessment environmental criteria, see Ch 2,2.3.

4.2 Bottom impact pressure, IP_{bi}

4.2.1 The bottom impact pressure due to slamming, IP_{bi} , is to be derived using the method given below. This method will produce impact pressures over the whole of the under-water plating region:

$$IP_{bi} = 0,5k_{sl} V_{bs}^2 \text{ kN/m}^2$$

where

$$k_{sl} = \text{hull form shape coefficient}$$

$$= \frac{\pi}{\tan \beta_p} \quad \text{for } \beta_p \geq 10$$

$$= 28 (1 - \tan(2\beta_p)) \quad \text{for } \beta_p < 10$$

β_p = deadrise angle, in degrees, see Fig. 3.4.1

V_{bs} = slamming velocity, in m/s, and is given by

$$= \sqrt{V_{th}^2 + 2m_1 \ln(N_{sl})} \quad \text{for } N_{sl} \geq 1$$

$$= 0 \quad \text{for } N_{sl} < 1$$

V_{th} = threshold velocity for slamming, in m/s, to be taken as:

$$= \sqrt{10}$$

N_{sl} = No of slams in a 3 hour period and is given by

$$= 1720PR_{sl} \sqrt{\frac{m_1}{m_0}}$$

PR_{sl} = probability of a slam and is given by

$$= e^{-u}$$

$$u = \left(\frac{z_{wl}^2}{2m_0} + \frac{V_{th}^2}{2m_1} \right)$$

z_{wl} = distance of the centroid of the area of plating or stiffener to the local design waterline

$$= z - (T_x + z_k)$$

m_1 = variance of the relative vertical velocity

$$= 0,25 (\omega_e f_{sl} H_r m)^2$$

m_0 = variance of the relative vertical motion

$$= 0,25 (f_{sl} H_r m)^2$$

ω = effective wave frequency based on 80 per cent ship length

$$= \sqrt{\frac{2\pi g}{0,8L_{WL}}}$$

ω_e = effective encounter wave frequency

$$= \omega \left(1 + \frac{0,2\omega V_{sp}}{g} \right)$$

$H_r m$ = relative vertical motion based on V_{sp} , see Table 3.2.1

f_{sl} = probability level correction factor for relative vertical motion

$$= 1,0$$

V_{sp} , z , z_k and T_x are defined in 1.3

See Fig. 3.4.1.

Fig. 3.4.1 Bow flare and bottom slamming angles

4.2.2 For the purposes of deriving the dynamic load factor, the rise time of the impact pressure may be taken as:

$$t_r = \frac{1}{4 \sqrt{IP_{bi}}} \text{ seconds}$$

It is assumed that the impact pressure may be represented by a triangular pulse load.

4.3 Bow flare and above waterline wave impact pressures, IP_{bf}

4.3.1 The bow flare wave impact pressure, wave impact pressure on sponsons and other parts of the side shell plating above the design waterline, IP_{bf} , in kN/m², due to relative motion is to be taken as:

$$IP_{bf} = 0,5 (k_{bf} V_{bf}^2 + k_{rv} H_{rv} V_{rv}^2) \text{ kN/m}^2$$

where

k_{bf} = hull form shape coefficient for wave impacts

$$= \frac{\pi}{\tan \beta_p} \quad \text{for } \beta_p \geq 10$$

$$= 28 (1 - \tan(2\beta_p)) \quad \text{for } \beta_p < 10$$

V_{bf} = wave impact velocity, in m/s, and is given by

$$= \sqrt{V_{thbf}^2 + 2m_1 \ln(N_{bf})} \quad \text{for } N_{bf} \geq 1$$

$$= 0 \quad \text{for } N_{bf} < 1$$

V_{thbf} = threshold velocity for wave impact, in m/s, to be taken as:

$$= \frac{\sqrt{10}}{\cos \alpha_p}$$

N_{bf} = No. of wave impacts in a 3 hour period and is given by

$$= 1720PR_{bf} \sqrt{\frac{m_1}{m_0}}$$

PR_{bf} = probability of a wave impact and is given by
= e^{-u}

$$u = \left(\frac{z_{wl}^2}{2m_0} + \frac{V_{thbf}^2}{2m_1} \right)$$

k_{rv} = hull form shape coefficient for impact due to forward speed

$$= \frac{\pi}{\tan(90 - \alpha_p)} \quad \text{for } \alpha_p \leq 80$$

$$= 28 (1 - \tan(2(90 - \alpha_p))) \quad \text{for } \alpha_p > 80$$

H_{rv} = relative wave heading coefficient

$$= 1,0 \quad \text{for } \gamma_p \geq 45$$

$$= \cos(45 - \gamma_p) \quad \text{for } \gamma_p < 45 \text{ and } \geq 0$$

$$= 0 \quad \text{for } \gamma_p < 0$$

V_{rv} = relative forward speed, in m/s

$$= 0,515 V_{sp} \sin(\gamma_p)$$

α_p = buttock angle measured in the longitudinal plane, in degrees, see Fig. 3.4.1

β_p = effective deadrise angle measured in the transverse plane, in degrees, see Fig. 3.4.1. For bow flare regions where the bow is non prismatic, i.e., changing rapidly, then β_p may be taken as the maximum of α_p or β_p . Note final β_p is to be decreased by 10° with a minimum of 0° to allow for the effects of roll motion on the above waterline impact pressures for ships with $C_b \leq 0,6$

γ_p = waterline angle measured in the horizontal plane, in degrees, see Fig. 3.4.1

C_b = Block coefficient as defined in Pt 3, Ch 1,5

z_{wl} , m_1 , m_0 are defined in 4.2 but are to be calculated using:

f_{sl} = probability level correction factor for relative vertical motion

$$= 1,0 \text{ for ships } C_b \leq 0,6$$

$$= 1,2 \text{ for ships } C_b > 0,6$$

NOTES

Where only two angles are known and are measured in the orthogonal planes, then the third angle may be obtained by the following expression:

$$\alpha = \tan^{-1}(\tan \beta \tan \gamma)$$

Local Design Loads

Volume 1, Part 5, Chapter 3

Sections 4 & 5

If the area of plating under consideration has a waterline angle which is re-entrant or decreasing, e.g. in the stern region, then the relative wave heading coefficient, H_{rv} , and the speed V_{sp} , used in the derivation of H_{rm} , are to be taken as zero. V_{sp} is defined in 1.3.1.

4.3.2 For the purposes of deriving the dynamic load factor, the rise time of the wave impact pressure may be taken as:

$$t_r = \frac{1}{4\sqrt{IP_{bf}}} \text{ seconds}$$

It is assumed that the wave impact pressure may be represented by a triangular pulse load.

4.3.3 The extents around the girth of the bow flare wave impact pressure are to be derived as follows:

(a) the vertical slam extent, g_{bfv} , is to be taken as:

$$g_{bfv} = \frac{4}{\sin\beta_p \sqrt{8k_{bf}}} \text{ m}$$

(b) the horizontal slam extent, g_{bfh} , is to be taken as:

$$g_{bfh} = 4 \text{ m}$$

where

k_{bf} and β_p are given in 4.3.1.

4.4 Impact loads on deckhouses and superstructures

4.4.1 Normally, it may be assumed that the equivalent static pressure loads given in 5.5 make due allowance for impact loads on deckhouse fronts and sides.

4.5 Bottom impact pressure for ships operating in the planing regime

4.5.1 The equivalent static bottom impact pressure due to slamming, P_{dI} , at the LCG for mono-hull planing hull forms is given by the following expression:

$$P_{dI} = \frac{k_{dI} \Delta f_{dI} (1 + a_{op})}{L_{WL} G_o} \text{ kN/m}^2$$

where

G_o = support girth or girth distance, in metres, as defined in Table 3.4.1

L_{WL} = waterline length, in metres, see 1.3.1

a_{op} = vertical acceleration as defined in 2.4

k_{dI} = hull form pressure factor
= 54

For craft in continuous contact with water:

$$\begin{aligned} f_{dI} &= 0,5 \text{ for } x = 0,0L_{WL} \\ &= 1,0 \text{ for } x = 0,5L_{WL} \\ &= 1,0 \text{ for } x = 0,75L_{WL} \\ &= 0,5 \text{ for } x = 1,0L_{WL} \end{aligned}$$

Intermediate values to be determined by linear interpolation. Otherwise $f_{dI} = 1,0$.

Table 3.4.1 Definition of G_o for the determination of bottom impact pressure, P_{dI} , for different regions

Bottom shell region	G_o	
	Hull forms with chines	Hull forms without chines
Between tangential points or chines	G_s	G_s
Between tangential points and design waterline	—	G_{WL}
NOTES 1. G_s = support girth, in metres. This is the girth distance measured between the bilge tangential points or chines at the LCG. The bilge tangential point is defined as the point where a line 50° above the horizontal touches the bilge plating, see Fig. 3.2.1. 2. G_{WL} = girth distance, in metres, measured between the waterlines on either side of a hull at the LCG.		

Section 5 Local design loads for decks and bulkheads

5.1 General

5.1.1 This Section gives formulations for design pressure loads for decks, watertight and deep tank boundaries including decks and bulkheads.

5.1.2 The loads acting on the deck structures are to reflect the intended purpose for each deck. If it is envisaged that the role of the ship will be such that it may be used for emergency evacuation incidents or similar situations, then the appropriate design loads are to be considered in the assessment. The maximum permissible deck loading are to be recorded in the Operations Manual or Stability Information Book.

5.1.3 Bulkheads and decks forming the boundary of tanks are to be assessed in accordance with the requirements for deep tanks using the loads defined in 5.8 and 5.9 or the maximum load experienced in service, e.g. from RAS operations, whichever is the greater. For an open system the pressure height may be taken from the keel to the filling point open to the atmosphere.

5.2 Pressure on external decks

5.2.1 The standard pressure requirements for external decks are given in 3.5. If the deck is also to be used for cargo, heavy equipment or similar, then the loads specified in 5.4 are also to be applied. Consideration will be given to a reduction in the weather deck pressure loading if it can be shown that the cargo or equipment stowage makes the weather deck pressure requirements conservative.

Local Design Loads

Volume 1, Part 5, Chapter 3

Section 5

5.3 Pressure on internal decks, P_{in}

5.3.1 The pressure acting on internal decks, P_{in} , not subject to cargo or heavy equipment loads is to be taken as:

$P_{in} = 5 \text{ kN/m}^2$ for accommodation spaces

$P_{in} = 10 \text{ kN/m}^2$ for workshop spaces

$P_{in} = 20 \text{ kN/m}^2$ for store spaces.

5.3.2 Alternatively the design pressure is to be based on the static loading on the deck with due allowance for inertial effects as follows:

$$P_{in} = W_{in} (1 + a_z) \text{ kN/m}^2$$

where the following values of static pressure are to be assumed

$W_{in} = 3 \text{ kN/m}^2$ for accommodation spaces

$W_{in} = 6 \text{ kN/m}^2$ for workshop spaces

$W_{in} = 12 \text{ kN/m}^2$ for store spaces

a_z is defined in 2.3.2.

5.3.3 The hydrostatic design pressure for decks specified as watertight by the Naval Authority shall be taken as that determined by the damage stability analysis and limit of watertight integrity.

5.3.4 The static design pressure for internal decks not specified as watertight may be provided by the designer.

5.4 Loads for decks designed for cargo or heavy equipment loads, P_{cd} and W_{cd}

5.4.1 Where the load applied to the deck can be considered as uniformly distributed, the cargo deck design pressure, P_{cd} , is to be taken as:

$$P_{cd} = W_{cd} (1 + a_z) \text{ kN/m}^2$$

where

a_z is the non dimensional vertical acceleration given in 2.3.2

W_{cd} is the static pressure exerted by the cargo on the deck as specified by the designer in kN/m^2 .

5.4.2 Where the load applied to the deck is not uniformly distributed, the likely actual forces and force distribution over the deck must be considered. The forces are to include the following if appropriate:

- gravity
- inertial forces due to ship motion
- wind loads
- forces imposed by the securing arrangements
- wave impact loads
- icing loads

$$F_{cd} = W_{ma} (1 + a_z) \text{ kN}$$

where

W_{ma} is the weight of each mass item on the deck as specified by the designer in kN.

5.5 Loads for deckhouses, bulwarks and superstructures, P_{dh}

5.5.1 The design normal pressure, P_{dh} , for the side, front and back panels of plating and stiffeners for deckhouses, bulwarks and superstructures is given by:

$$P_{dh} = C_1 P_s \text{ kN/m}^2$$

where

$C_1 = 1,25C_2$ for exposed deckhouse fronts and superstructure fronts forward of $0,67L_R$

$= 1,15C_2$ for exposed deckhouse fronts and superstructure fronts aft of $0,67L_R$

$= 1,15$ for exposed machinery casings

$= 0,8$ for the side and back panels of deckhouses that are stepped in from the deck edge by 1,0 m or more which are also above the nominal wave limit height, H_w , see 3.4.4

$= 0,5$ for non-exposed deckhouse and superstructure fronts, sides and backs which are also above the nominal wave limit height

$= 1,0$ elsewhere

P_s is to be taken at the height of the deck supporting the deckhouse front, side or back panel under consideration, P_s is defined in 3.2

$C_2 = 1,2$ for panels below the nominal wave limit height
 $= 1,0$ elsewhere

Typical values of C_1 are shown in Fig. 3.5.1

Where there is more than one deckhouse, the front of the most forward deckhouse will normally be considered exposed, whereas the back of this deckhouse will be non-exposed. Normally, the front of the deckhouse aft of this one will also be considered non-exposed.

5.6 Pressure height for deep tank bulkheads and boundaries, H_{tk}

5.6.1 The design lateral pressure height for tank and deep tank bulkheads and boundaries, H_{tk} , is to be taken as

H_{tk} = the distance, in m, from the baseline to half the distance from the top of the tank to the top of the overflow. For determination of the maximum head, the top of the overflow is to be taken as not less than 1,8 m above the crown of the tank, see Fig. 3.5.2.

5.6.2 For tanks which are connected to a filling tank system, H_{tk} may be taken as the distance, in m, from the baseline to the highest point of the overflow pipe from the filling tank into the overflow tank. Consideration may need to be given to the pressure height for situations where any of the valves in the filling system may be closed. The transfer pump must feed only into the filling tank and must not be linked directly to the tanks.

5.6.3 In a filling tank system, suitable measures are to be provided such that the maximum design level in the system cannot be exceeded. Automatic shutdown measures are to ensure a fail safe arrangement to avoid overfilling the filling tank or the overflow tank. The overflow pipe is to be of sufficient size to ensure that the filling trunk is not overfilled.

5.7 Pressure height for watertight bulkheads and boundaries, H_{da}

5.7.1 The design lateral pressure height for watertight bulkheads and boundaries, H_{da} , is to be taken as

- (a) for a watertight bulkhead design philosophy based on a SOLAS type approach, i.e. to the top of a watertight bulkhead deck or freeboard deck, see Pt 3, Ch 2, 1.3.3.2 and illustrated in Fig. 2.1.1(b) in Pt 3, Ch 2.

H_{da} = the vertical distance, in m, from baseline to a line 0,91 m above the top of the watertight bulkhead at side, see Fig. 3.5.3(a).

- (b) for a watertight bulkhead design philosophy based on a standard which requires a damaged stability draft and heel envelope approach, e.g. the red risk line approach, see Pt 3, Ch 2, 1.3.3.3 and illustrated in Fig. 2.1.2(b) in Pt 3, Ch 2.

H_{da} = the distance, in m, from baseline to the damaged stability draft envelope at the centreline, see Fig. 3.5.3(b).

NOTE

The effect of lesser angles of heel in the damage situation may lead to an increase in the effective pressure height, especially in way of the forward end of the ship where it may be necessary to consider H_{da} based on a zero heel angle.

Local Design Loads

Volume 1, Part 5, Chapter 3

Section 5

5.8 Design pressures for watertight and deep tank bulkheads and boundaries

5.8.1 The design normal pressure for bulkhead plating with stiffeners is to be considered separately for the plating and the stiffeners. The design normal pressure for the plating, P_{bhp} , is to be taken as follows:

Deep Tank

$$\rho g (H_{tk} - z_p) \text{ kN/m}^2$$

WT sub-division based on the head normal to the line of watertight integrity

maximum of

$$10 ((H_{da} - z_p) \cos \theta + y_p \sin \theta) \text{ kN/m}^2$$

$$10 (H_{da} - z_p) \text{ kN/m}^2$$

where

ρ = density of fluid, in tonnes/m³, and is not to be taken as less than 1,025

z_p = distance above the baseline of a point one-third of the height, above the lower edge, of the plate strake under consideration. z_p is illustrated in Fig. 3.5.4 for horizontally stiffened plating and 3.5.5 for vertically stiffened plating

y_p = distance from the centreline to the mid-breadth of the plate strake under consideration. y_p is always to be taken as positive

θ = the stipulated damaged stability heel angle, see also Pt 3, Ch 2, 1.3. For a SOLAS type approach, θ is normally to be taken as 0,0.

5.8.2 The design normal pressure for the stiffener, P_{bhs} , is to be taken as follows:

Deep Tank

$$\rho g (H_{tk} - z_s) \text{ kN/m}^2 \text{ (Deep Tank)}$$

WT sub-division

maximum of:

$$10 ((H_{da} - z_s) \cos \theta + y_s \sin \theta) \text{ kN/m}^2$$

$$10 (H_{da} - z_s) \text{ kN/m}^2$$

where

z_s = distance above baseline of the mid span of the vertical stiffener under consideration, see Fig. 3.5.5

or

z_s = distance above baseline of the mid span of the horizontal stiffener under consideration, see Fig. 3.5.4

y_s = distance from the centreline to the mid span of the stiffener under consideration. y_s is always to be taken as positive

ρ = density of fluid, in tonnes/m³, and is not to be taken as less than 1,025.

5.8.3 The appropriate design criteria are to be applied to the bulkhead plating and stiffeners, see Pt 6, Ch 5. It is not permissible to use watertight criteria for a deep tank design head.

5.8.4 The design impulse pressure, IP_{bh} , for the bulkhead plating and stiffeners may be ignored, unless these members are likely to be subjected to significant sloshing loads or similar. In this case it will be necessary to determine the sloshing loads using a suitable direct calculation procedure.

5.9 Design pressures for collision bulkheads

5.9.1 The design lateral pressure height for collision bulkheads, H_{cb} , is to be taken as:

H_{cb} = the vertical distance, in metres, from the baseline to 0,91 m above the uppermost point of the collision bulkhead.

5.9.2 The design normal pressure for the collision bulkhead plating, P_{bhp} , is to be taken as:

$$P_{bhp} = 10 (H_{cb} - z_p) \text{ kN/m}^2$$

where

z_p = distance above baseline of a point one third of the height, above the lower edge, of the plate strake under consideration.

5.9.3 The design normal pressure for bulkhead stiffeners, P_{bhs} , is to be taken as:

$$P_{bhs} = 10 (H_{cb} - z_s) \text{ kN/m}^2$$

where

z_s = distance above base of the mid-span of the vertical stiffener under consideration, see Fig. 3.5.5

or

z_s = distance above base of the mid-span of the horizontal stiffener under consideration, see Fig. 3.5.4.

5.9.4 The collision bulkheads are to be designed to the deep tank design criteria specified in Pt 6, Ch 5.

5.9.5 If there is a design requirement for the ship to be able to remain operational after an incident which results in the collision bulkhead becoming the primary watertight boundary to the sea, then it will be necessary to design the collision bulkhead using the pressures for the shell envelope, P_s , given in Section 3 and the shell envelope design criteria. It will also be necessary to consider the effects of wave impact pressures, see 4.3, using the design speed requirement after damage.

5.10 Design loads for RSA notation assessment

5.10.1 The capability of transverse bulkheads, longitudinal bulkheads, watertight decks and other structure to withstand any additional loads as a consequence of damage, e.g. sloshing loads on watertight bulkheads, may need to be specially considered. Pressure heads consistent with draughts and heel angles determined from the damage stability analyses are to be used for local scantling assessment.

5.10.2 Where the Naval Authority requires watertight boundaries for damage control purposes, the nominated decks are to be assigned as watertight boundaries, see Pt 6, Ch 3,10. The pressure heads used in the assessment of damage control decks are to be the greater of that determined from the Rules or that specified by the Naval Authority.

5.10.3 The local design loads for structures subjected to additional loading as a consequence of structural damage are to be taken as specified in this Chapter except that the wave height factor, f_{Hs} , may be reduced, to account for the lesser environmental requirements, as follows:

f_{Hs} may be reduced by a factor of 1,85

where

f_{Hs} is defined in 1.2.

5.10.4 Where local strength issues need to be considered, the following local loads are to be applied in the evaluation contained in Pt 6, Ch 4,4.1:

- Hydrostatic load due to flooding taking account of the increase in local draft.
- Wave and inertial loads in the damaged condition, derived using the reduction factor given in 5.10.3.
- Local loads on watertight divisions as a consequence of flooding. For the evaluation of local loads on watertight divisions, the standard design pressure, H_{da} (see 5.7) may be applied. Alternatively the external hydrostatic and wave pressure load, P_s , may be applied using the reduction factor given in 5.10.3.
- Wave impact loads need not be considered unless a significant operational requirement is necessary following damage.

Local Design Loads

Volume 1, Part 5, Chapter 3

Sections 5, 6 & 7

5.11 Design pressure for magazine decks and bulkheads

5.11.1 For magazine structure which is assessed in accordance with Pt 4, Ch 1.6.4 the quasi-static design pressure is to be taken as follows:

$$P_{mag} = 2,25 \left(\frac{W_e}{V} \right)^{0,72} \times 10^3 \text{ kN/m}^2$$

where

W_e = weapon equivalent weight of TNT, in kg
 V = free compartment volume, in m³.

5.11.2 For magazines below the limit of watertight integrity the design pressure, P_{mag} , is not to be taken as less than the design pressure for watertight bulkheads and boundaries, plating and stiffening, see 5.8.

Section 6 Other local loads

6.1 General

6.1.1 This Section gives formulations for design pressure loads for shell closing appliances and requirements for gravity and inertial loads due to equipment, payload, cargo, etc., acting on ramps and lifting appliances.

6.2 Loads for ramps and lifts, P_{ra}

6.2.1 The loads acting on ramps and lifts intended to be used at sea, P_{ra} , is to be derived as follows:

$$P_{ra} = W_{cd} (1 + f_d (a_z + a_{ra})) \text{ kN/m}^2$$

where

W_{cd} is the equivalent static pressure exerted by the cargo on the ramp or lift as specified by the designer in kN/m²

a_z is the non dimensional vertical acceleration given in 2.3.2

a_{ra} = maximum acceleration of the lift, see 2.3

f_d = duty factor for the lift or ramp
 = 2,0 for operation with personnel
 = 1,5 otherwise.

6.2.2 If the hoisting speed of the ramp or lift is such that the acceleration of the lift will cause an increase in the forces acting on the lift, then this acceleration term should be included.

6.2.3 Where the lift or ramp is designed to operate totally or partially under water, then due consideration is to be taken of the additional forces applied to the lift or ramp as a direct consequence of the water environment, e.g. added mass and velocity dependant damping forces.

6.3 Loads for windows and side lights in the shell envelope, P_{wi}

6.3.1 The design normal pressure, P_{wi} , for windows and side lights in deckhouses and superstructures is given by:

$$P_{wi} = W_1 P_s \text{ kN/m}^2$$

In no case is the design pressure for windows to be taken less than $P_{wi,min}$ as given by:

$$P_{wi,min} = W_1 (10 + 0,04L_R) \text{ kN/m}^2$$

where

$$W_1 = 1,33C_1$$

z = vertical distance, in metres, from baseline to the structural element being considered

P_s is to be taken at the height of the deck below the side light, see 3.2

C_1 is defined in 5.5.1

D and T are defined in 1.3.

Section 7 Ice loads

7.1 General

7.1.1 A half or full icing allowance in accordance with Pt 5, Ch 2.4 is to be included in the local load calculations of plating and stiffed panels of ships that are required to operate for extended periods in areas where ice accretion is expected.

Section

- 1 **General**
- 2 **Still water global loads**
- 3 **Global hull girder loads**
- 4 **Extreme hull girder loads**
- 5 **Residual strength hull girder loads**
- 6 **Loading guidance information**

■ Section 1 General

1.1 Introduction

1.1.1 The global design loads detailed in this Chapter are to be used in conjunction with Part 6 to determine the global hull strength requirements. The application of the global design loads is given in Pt 6, Ch 4.

1.1.2 Flowcharts showing the procedures for the specification of the global design loads are shown in Fig. 4.1.1.

1.1.3 The global design loads are divided into the following categories:

(a) Hull girder loads.

The types of hull girder loads which are to be considered for strength purposes in the initial design assessment are distinguished on the basis of their frequency of occurrence and are defined as follows:

- (i) Still water shear forces and associated bending moments arising from static mass distribution and buoyancy forces, see Section 2.
- (ii) Low frequency vertical wave shear forces and associated bending moments arising from hydrodynamic forces.
- (iii) High frequency dynamic shear forces and associated bending moments arising from slamming events.

The derivation of the hull girder loads is given in Section 3.

(b) Extreme hull girder loads.

The loads to be considered for extreme hull girder strength purposes are used to assess the hull girder structural capability to withstand extreme sea states. The derivation of the extreme hull girder loads is given in Section 4.

(c) Hull girder loads for residual strength assessment.

The loads to be considered for residual strength purposes are used to assess the structural capability of the ship after damage to withstand moderately severe sea states. The derivation of the residual strength hull girder loads is given in Section 5.

1.1.4 Alternative methods of establishing the global load and design criteria will be specially considered, provided that they are based on model tests, full scale measurements or other generally accepted theories. In such cases, full details of the methods used and the results are to be provided when plans are submitted for approval.

1.2 Definitions and symbols

1.2.1 L_R , B , B_{WL} , D and T are defined in Pt 3, Ch 1.5. F_n and Δ are defined in Ch 3, 1.3.2 and Ch 3, 1.3.1 respectively. Displacement mode and non-displacement mode are defined in Ch 3, 1.3.

1.2.2 For longitudinal strength calculations of vertical shear force and bending moment, downward loads are to be taken as positive values and are to be integrated in the forward direction from the aft end of the ship. Shear force is positive when the algebraic sum of all vertical forces aft of the position is positive. Hogging bending moments are to be taken as positive values.

1.3 Direct calculation procedures

1.3.1 The still water longitudinal strength values are to be derived using a suitable longitudinal strength calculation system.

1.3.2 In direct calculation procedures capable of deriving the wave induced loads on the ship account is to be taken of the ship's actual form and weight distribution.

1.3.3 Lloyd's Register's (hereinafter referred to as 'LR') direct calculation method of the long term wave induced loads involves derivation of response to regular waves by strip theory, short-term response to irregular waves using the sea spectrum concept, and long-term response predictions using statistical distributions of sea states. Other direct calculation methods submitted for approval are normally to contain these three elements and produce similar and consistent results when compared with LR's methods.

1.3.4 The long term response predictions are to be based on probability of 10^{-8} . The LR long term prediction method produces values which have a low statistical probability of occurring taking into account many factors. These factors include:

- The operating life of the vessel, normally the operating life is taken as 20 years which is assumed to correspond to 10^8 wave encounters.
- The mission profile of the vessel.
- Different loading conditions.
- The effect of different wave headings on ship motions.

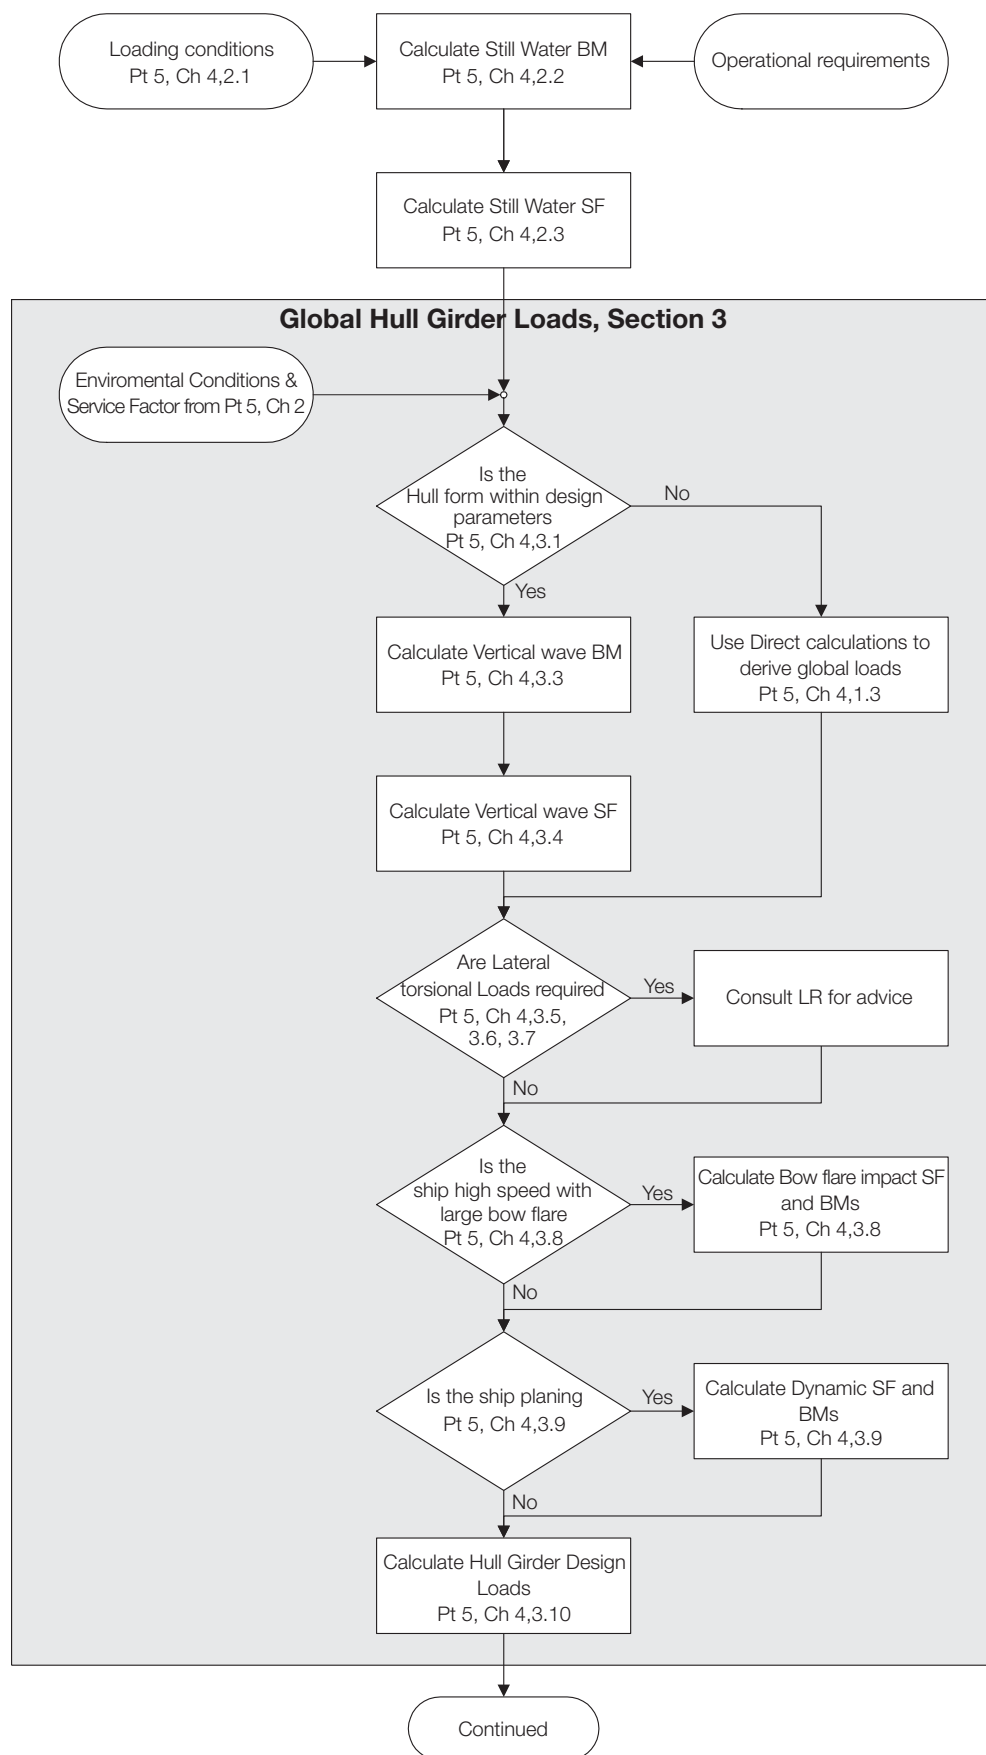

Fig. 4.1.1 Procedure for the specification of global design loads (see continuation)

1.4 Information required

1.4.1 In order that an assessment of the longitudinal strength requirements can be made, the following information is to be submitted, in LR's standard format where appropriate:

- (a) General arrangement and capacity plan or list showing details of the volume and position of centre of gravity of all tanks, spaces and compartments.
- (b) Bonjean data, in the form of tables or curves, for at least 21 equally spaced stations along the hull together with a lines plan and/or tables of offsets.
- (c) Details of the calculated lightweight and its distribution.
- (d) Details of the weights and centres of gravity of all dead-weight items for each of the main loading conditions.
- (e) Calculated still water bending moments and shear forces and the proposed design envelopes. Calculated wave and dynamic bending moment and shear force values.

1.4.2 It is recommended that this information be submitted in the form of a preliminary Loading Manual or Stability Information Book including: specification of operational requirements, hydrostatic data, details of loading conditions, etc. It may also be necessary to submit a summary of the damage stability analysis.

■ Section 2 Still water global loads

2.1 General

2.1.1 The still water bending moments and shear force distributions are to be derived using a suitable direct calculation method for a range of loading conditions which cover the operational envelope of the ship.

2.1.2 In general, loading conditions based on amount of fuel, fresh water, stores and payload at departure, arrival and during special operations are to be considered. Loading conditions representing special operational requirements are also to be considered.

2.1.3 As a minimum the following conditions are to be considered in deriving the maximum hogging and sagging still water bending moment and shear force envelopes:

- Deep draught (departure) condition with no growth margin.
- Light draught (arrival) condition with no growth margin.
- Deep draught condition with full growth margin.
- Light draught condition with full growth margin.
- Maximum and minimum operating draught conditions, if different to the above.
- Ballast conditions, where appropriate.
- Any special mid-voyage conditions caused by changes in payload or ballast distribution.
- Other special loading conditions, e.g. Emergency evacuation or similar emergency scenario conditions, heavy payloads or cargo, deck cargo conditions, etc., where applicable.

2.1.4 For special loading conditions which may only be required in restricted operational areas, a reduced service area factor, f_s , may be allowable, see 3.3.1.

2.1.5 If the still water bending moment and shear force envelope approach is not appropriate, (as a consequence of the envelope being too severe due to one or two special conditions distorting the envelope) then individual consideration of the bending moment and shear force will be necessary.

2.1.6 A full or half icing allowance in accordance with Ch 2,4 is to be included in the still water bending moment and shear force calculations.

2.1.7 To account for miscellaneous fittings such as stanchions and rails an additional 5 per cent should be added to the total ice weight calculated for both full and half icing allowances.

2.2 Still water bending moments

2.2.1 The design still water hogging and sagging bending moment distribution envelope, M_S , is to be taken as the maximum sagging (negative) and maximum hogging (positive) still water bending moments, in kN m, calculated at each position along the ship. The maximum moments from all loading conditions are to be used to define the still water bending moment distribution envelope.

2.2.2 It is normal for ships which have low deadweight requirements, e.g. frigates, to have a bending moment distribution envelope which is always hogging. In this case the maximum sagging bending moment envelope may be taken as the minimum hogging bending moment.

2.3 Still water shear forces

2.3.1 The design still water shear force distribution envelope, Q_S , is to be taken as the maximum positive and negative shear force values, in kN, calculated at each position along the ship. The maximum shear forces from all loading conditions, see 2.2, are to be used to define the still water shear force distribution envelope.

2.3.2 It is recommended that the minimum shear force value over the midships region should not be less than 50 per cent of the maximum value.

■ Section 3 Global hull girder loads

3.1 General

3.1.1 The global hull girder loads specified here are applicable to all displacement mono-hull naval ships as defined in Pt 1, Ch 2,2.2.5. These loads are to be used in the hull girder strength assessment given in Pt 6, Ch 3.

3.1.2 Individual consideration based on direct calculation procedures will generally be required for ships having one or more of the following characteristics:

Froude number $> 0,8$ (based on V_{sp} , see Ch 3, 1.3.1)

$L_R/B_{WL} \leq 5$, or $B_{WL}/D \geq 2,5$

Unusual hull weight distribution

Unusual type or design.

3.2 Environmental conditions

3.2.1 The environmental conditions given in Chapter 2 are to be used in the derivation of the global hull girder loads.

3.3 Vertical wave bending moments

3.3.1 The minimum value of vertical wave bending moment, M_W at any position along the ship may be taken as follows:

$$M_W = F_f D_f M_o \text{ kNm}$$

where

F_f is the hogging, F_{fH} , or sagging, F_{fS} , correction factor based on the amount of bow flare, stern flare, length and effective buoyancy of the aft end of the ship above the waterline

F_{fS} is the sagging (negative) moment correction factor and is to be taken as

$$F_{fS} = -1,10 R_A^{0,3} \quad \text{for values of } R_A \geq 1,0$$

$$F_{fS} = -1,10 \quad \text{for values of } R_A < 1,0$$

An area ratio value of 1,0 results in a sagging correction factor of $-1,10$.

F_{fH} is the hogging (positive) moment correction factor and is to be taken as

$$F_{fH} = \frac{1,9C_{b1}}{(C_{b1} + 0,7)}$$

R_A is an area ratio factor, see 3.3.2

D_f = the longitudinal distribution factor

= 0 at aft end of L_R

= 1,0 between $0,4L_R$ and $0,65L_R$

= 0 at forward end of L_R

Intermediate values of D_f are to be determined by linear interpolation

$$M_o = 0,1L_f f_s L_R^2 B_{WL} (C_{b1} + 0,7) \text{ kNm}$$

$$L_f = 0,0412L_R + 4,0 \quad \text{for } L_R \leq 90 \text{ m}$$

$$= 10,75 - \left(\frac{300 - L_R}{100} \right)^{1,5} \quad \text{for } L_R > 90 \text{ m}$$

$$= 10,75 \quad \text{for } L_R > 300 \text{ m}$$

$$= 10,75 - \left(\frac{L_R - 350}{150} \right)^{1,5} \quad \text{for } L_R > 350 \text{ m}$$

f_s = service area factor applicable to the Service Area Notation. To be specially considered depending upon the required areas of operation and in any event should be not less than 0,5

For unrestricted sea-going service $f_s = 1,0$, for other Service Areas Notations, see Ch 2,2.4

B_{WL} = maximum waterline breadth, see 1.2.1

C_{b1} = C_b but is not to be taken less than 0,60

C_b = the block coefficient as defined in Pt 3, Ch 1,5.

3.3.2 The area ratio factor, R_A , for the combined stern and bow shape is to be derived as follows:

$$R_A = \frac{30 (A_{BF} + 0,5A_{SF})}{L_R B_{WL}}$$

where

A_{BF} is the bow flare area, in m^2 , see 3.3.3

A_{SF} is the stern flare area, in m^2 , see 3.3.4.

3.3.3 The bow flare area, A_{BF} , is illustrated in Fig. 4.3.1 and may be derived as follows:

$$A_{BF} = A_{UB} - A_{LB} \text{ m}^2$$

where

A_{UB} = half the water plane area at a waterline of $T_{C,U}$ of the bow region of the hull forward of $0,8L_R$ from the AP

A_{LB} = half the water plane area at the design draught of the bow region of the hull forward of $0,8L_R$ from the AP

Note the AP is to be taken at the aft end of the Rule length, L_R

The design draught is to be taken as T , see Ch 3,1.3.1

Alternatively the following formula may be used

$$A_{BF} = 0,05L_R (b_0 + 2b_1 + b_2) + b_0 a/2 \text{ m}^2$$

where

b_0 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at the FP, in metres, see Fig. 4.3.1

b_1 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at $0,9L_R$ from the AP, in metres

b_2 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at $0,8L_R$ from the AP, in metres

a = projection of $T_{C,U}$ waterline forward of the FP, in metres

$T_{C,U}$ is a waterline taken $L_f/2$ m above the design draught

$$T_{C,U} = T + \frac{L_f}{2} \text{ m}$$

L_f is given in 3.3.1

For ships with large bow flare angles above the $T_{C,U}$ waterline the bow flare area may need to be specially considered.

3.3.4 The stern flare area, A_{SF} , is illustrated in Fig. 4.3.1 and is to be derived as follows:

$$A_{SF} = A_{US} - A_{LS} \text{ m}^2$$

where

A_{US} = half the water plane area at a waterline of $T_{C,U}$ of the stern region of the hull from aft to $0,2L_R$ forward of the AP

A_{LS} = half the water plane area at a waterline of $T_{C,L}$ of the stern region of the hull from aft to $0,2L_R$ forward of the AP

$T_{C,L}$ is a waterline taken $L_f/2$ m below the design draught

$$T_{C,L} = T - \frac{L_f}{2} \text{ m}$$

For ships with tumblehome in the stern region, the maximum breadth at any waterline less than $T_{C,U}$ is to be used in the calculation of A_{US} . The effects of appendages including bossings are to be ignored in the calculation of A_{LS} .

Fig. 4.3.1 Derivation of bow and stern flare areas

3.3.5 Alternatively, for frigate and destroyer type ships the hogging and sagging vertical wave bending moments and shear forces may be derived from long term 'in-service' measurements of a series of ships with similar hull forms, mass distributions and areas of operation. Typically this will be based on a static wave balance approach. The longitudinal distribution of the vertical wave bending moment is to be taken in accordance with the longitudinal distribution factor, D_f .

3.3.6 The vertical wave bending moments and associated shear forces are not to be taken as less than that given by 3.3.1 and 3.4.1.

3.3.7 Direct calculation methods may be used to derive the vertical wave bending moments, see 1.3.

3.3.8 The sagging correction factor, f_{IS} , in the vertical wave bending moment formulation in 3.3.1 may be derived by direct calculation methods. Appropriate direct calculation methods may include a combination of long term ship motion analysis, non linear ship motion analysis and static balance on a wave crest or trough.

3.4 Vertical wave shear forces

3.4.1 The wave shear force, Q_W , at any position along the ship is given by:

$$Q_W = \frac{3K_f M_0}{L_R} \text{ kN}$$

where K_f is to be taken as follows, see also Fig. 4.3.2

(a) Positive shear force:

- $K_f = 0$ at aft end of L_R
- $= +0,836F_{IH}$ between $0,2L_R$ and $0,3L_R$
- $= +0,65F_{IH}$ between $0,4L_R$ and $0,5L_R$
- $= -0,65F_{IS}$ between $0,5L_R$ and $0,6L_R$
- $= -0,91F_{IS}$ between $0,7L_R$ and $0,85L_R$
- $= 0$ at forward end of L_R

(b) Negative shear force:

- $K_f = 0$ at aft end of L_R
- $= +0,836F_{IS}$ between $0,15L_R$ and $0,3L_R$
- $= +0,65F_{IS}$ between $0,4L_R$ and $0,5L_R$
- $= -0,65F_{IH}$ between $0,5L_R$ and $0,6L_R$
- $= -0,91 F_{IH}$ between $0,7L_R$ and $0,85L_R$
- $= 0$ at forward end of L_R

Fig. 4.3.2 Shear force factor K_f

Intermediate values are to be determined by linear interpolation.

M_0 , F_{tH} and F_{tS} are defined in 3.3.1.

3.4.2 The direct calculation method used to derive the vertical bending moments may also be used to derive the vertical shear forces, see 1.3.

3.5 Lateral wave bending moments

3.5.1 If considered necessary by LR, the effects of lateral bending moments may need to be considered. Normally this will only be required for ships with extreme hull forms, multihulls, unusual structural configurations or arrangements or particular loading conditions or operational modes which are likely to result in significant lateral stresses.

3.6 Lateral wave shear forces

3.6.1 If considered necessary by LR, the effects of lateral shear forces may need to be considered. Normally this will only be required for ships with extreme hull forms, multihulls, unusual structural configurations or arrangements or particular loading conditions or operational modes which are likely to result in significant lateral stresses.

3.7 Torsional moments

3.7.1 If considered necessary by LR, the effects of torsional moments may need to be considered. Normally this will only be required for ships with extreme hull forms, multihulls, unusual structural configurations or arrangements or particular loading conditions or operational modes which are likely to result in significant torsional stresses.

3.8 Bow flare impact global loads

3.8.1 The requirements of this Section are applicable to fast ships operating in the displacement mode that satisfy the following requirements:

speed $V_{sp} > 17,5$ knots

bow shape factor $\psi > 0,15$

where

$$\psi = \frac{100A_b k_{fr}}{L_R^{1,5} B_{WL}}$$

A_b = bow flare area, see 3.8.2

k_{fr} = bow freeboard correction factor

$$k_{fr} = \frac{6}{h_{fr}} \text{ but is to be not less than } 0,5 \text{ nor greater than } 1,5$$

h_{fr} = freeboard height to the upper deck measured at the FP, in metres

For ships with knuckles in the bow flare region above which the hull is nearly vertical or exhibits tumblehome, the values of h_{fr} and A_b are normally to be based on the bow flare region below the knuckle

L_R and B_{WL} are as defined in 1.2.1

V_{sp} is defined in Ch 3,1.3.

3.8.2 The bow flare area is normally to be derived as follows:

$$A_b = 0,05L_R (a_0 + 2a_1 + a_2) + a_0 b/2 \text{ m}^2$$

where

a_0 = projection of deck at waterline at the FP, in metres

a_1 = projection of deck at waterline at $0,9L_R$, in metres

a_2 = projection of deck at waterline at $0,8L_R$, in metres

b = projection of upper deck at waterline from the FP to stem, in metres

see Fig. 4.3.3.

L_R is given in 1.2.1.

3.8.3 The dynamic sagging bending moment due to bow flare impact loads, M_{BF} , is given by the following:

$$M_{BF} = -33D_{bf} A_b k_{fr} L_R \text{ kNm}$$

where

D_{bf} = the longitudinal distribution factor, see Table 4.3.1

A_b is given in 3.8.2

k_{fr} is given in 3.8.1

L_R is given in 1.2.1.

It is not required to consider a hogging bow flare impact bending moment.

3.8.4 If the bow flare impact bending moment, M_{BF} , is greater than the wave bending moment, M_W , see 3.3.1, at any position along the length then M_W is to be replaced by M_{BF} at these positions.

Fig. 4.3.3 Derivation of bow shape

Table 4.3.1 Longitudinal distribution factor D_{bf}

Position	Longitudinal distribution factor D_{bf}
0,0 L_R	0,00
0,4 L_R	1,00
0,5 L_R	1,00
0,6 L_R	0,98
0,7 L_R	0,95
0,8 L_R	0,81
0,9 L_R	0,44
1,0 L_R	0,00

NOTES

- Intermediate values to be obtained by interpolation.
- L_R as defined in 1.2.1.

3.8.5 The bow flare impact shear force, Q_{BF} , associated with the bow flare bending moment is to be taken as follows over the forward half length of the ship:

$$Q_{BF} = 132K_{bf} A_b k_{fr} \text{ kN}$$

where K_{bf} is to be taken as follows:

Positive shear force

$$K_{bf} = \begin{cases} 0,0 & \text{aft of } 0,5L_R \\ 0,7 & \text{between } 0,5L_R \text{ and } 0,6L_R \\ 1,0 & \text{between } 0,7L_R \text{ and } 0,85L_R \\ 0,0 & \text{at forward end of } L_R \end{cases}$$

Intermediate values are to be determined by linear interpolation.

Negative shear force

$$K_{bf} = 0,0 \text{ for the length of the ship, } L_R$$

where

$$A_b \text{ is given in 3.8.2}$$

$$k_{fr} \text{ is given in 3.8.1.}$$

3.8.6 If the bow flare impact shear force, Q_{BF} , is greater than the wave shear force, see 3.4, at any position along the length then the wave shear force, Q_W , is to be taken as Q_{BF} at these positions.

3.9 Dynamic bending moments and associated shear forces

3.9.1 The requirements of this Section are applicable to mono-hull ships when operating in the planing regime.

3.9.2 This Section gives formulae for the derivation of the high frequency dynamic bending moment, shear forces and associated pressures. The bending moment and shear force values are to be used for the global design loads if they are greater than the values derived in accordance with 3.3 and 3.4.

3.9.3 The dynamic bending moment, due to a high speed planning craft landing on a wave crest amidships, at any position along the ship, is to be calculated using the following expression:

$$M_{DW} = F_{df} D_{df} |M_d| \text{ kN/m}$$

where

$$|M_d| = 51\Delta L_R (16a_{op} - 4a_{bp} - 17a_{sp} - 5) \times 10^{-3} \text{ kN/m}$$

$$F_{df} = \begin{cases} -1,0 & \text{for sagging (negative) moment} \\ 1,0 & \text{for hogging (positive) moment} \end{cases}$$

$$D_{df} = \begin{cases} 0 & \text{at aft end of } L_R \\ 1,0 & \text{between } 0,4L_R \text{ and } 0,65L_R \\ 0 & \text{at forward end of } L_R \end{cases}$$

Intermediate values of D_{df} are to be determined by linear interpolation

$$a_{op} = \text{vertical acceleration at the LCG, in terms of } g, \text{ as defined in Ch 3,2.4}$$

$$a_{bp} = \text{vertical acceleration at forward end of } L_R, \text{ in terms of } g, \text{ Ch 3,2.4}$$

$$a_{sp} = \text{vertical acceleration at aft end of } L_R, \text{ in terms of } g, \text{ Ch 3,2.4.}$$

3.9.4 The non-dimensional vertical acceleration at the LCG, a_{op} , as defined in Ch 3,2.4, is not to be taken less than 1,0 for the purpose of determining the dynamic bending moment M_{DW} . If the values of a_{bp} and a_{sp} are unknown, the distributions given in Ch 3,2.4 are to be applied.

3.9.5 Bottom longitudinals within 0,4 L_R of amidships are subjected to the following effective pressure, P_{ds} :

$$P_{ds} = 0,14P_{dI} + 8T \text{ kN/m}^2$$

where

$$P_{dI} \text{ is as defined in Ch 3,4.5}$$

T is defined in 1.2.1.

3.9.6 Bottom plating within 0,4 L_R of amidships is subjected to the following effective pressure, P_{dp} :

$$P_{dp} = 0,175P_{dI} + 10T \text{ kN/m}^2$$

3.9.7 The dynamic shear force, Q_{DW} , at any position along the ship is given by:

$$Q_{DW} = 4K_f M_D / L_R \text{ kN}$$

where

M_D is defined in 3.9.3

K_f is defined in 3.4.1.

3.10 Hull girder design loads

3.10.1 The Rule bending moment envelope, M_R , and associated shear force envelope, Q_R , for use with the scantling determination procedures in Pt 6, Ch 3 are to be determined as follows:

- The Rule vertical bending moment envelope, M_R , is to be taken as $(M_W + M_S)$, as defined in 3.3 and 2.2, taking into account the hogging and sagging conditions.
- The Rule vertical shear force envelope, Q_R , is to be taken as $(Q_W + Q_S)$, as defined in 3.4 and 2.3, taking into account the hogging and sagging conditions.

3.10.2 The values M_W and Q_W are to be replaced by M_{BF} and Q_{BF} if these are larger, see 3.4 and 3.8.6. Similarly, the values M_W and Q_W are to be replaced by M_{DW} and Q_{DW} if these are larger.

Section 4 Extreme hull girder loads

4.1 Introduction

4.1.1 The extreme hull girder loads specified in this Section are applicable to all mono-hull naval ships for which the optional **ESA1** or **ESA2**, Extreme Strength Assessment, notation is required. The design criteria detailed in this Section are to be used in conjunction with the extreme hull girder strength assessment procedure given in Pt 6, Ch 4.3.

4.1.2 The extreme hull girder loads are typical lifetime maximum values that a ship is likely to encounter if it was to be present in an extreme seastate in sea areas associated with its service area notation.

4.2 Environmental conditions

4.2.1 The environmental design criteria for extreme design analysis given in Chapter 2 are to be used to determine the extreme hull girder loads.

4.2.2 The hull girder loads for the extreme hull girder strength assessment for unrestricted service operation, i.e. service area notation **SA1**, are typical maximum loads that are predicted for extreme winter North Atlantic conditions in head seas at low forward speed.

4.2.3 For other service area notations, the hull girder loads for the extreme hull girder strength assessment are typical maximum loads that are likely to be encountered within the restricted operational area.

4.3 Extreme vertical wave bending moments

4.3.1 For all mono-hull ships, the extreme vertical wave bending moment, M_{WEX} , at any position along the ship is given by:

$$M_{WEX} = K_{fEX} M_W \text{ kN m}$$

where

M_W is given in 3.3

K_{fEX} = extreme scaling factor
= 1,5.

4.3.2 Alternatively the extreme hull girder strength assessment wave loads may be derived using direct calculation methods, model tests or similar taking into account the likely range of wave periods and the environmental conditions specified in Chapter 2.

4.3.3 In deriving the wave loads, the longitudinal distribution of the vertical wave bending moment is to be taken in accordance with the longitudinal distribution factor, D_f , see 3.3.1. Where appropriate, the hogging and sagging correction factor, F_{fH} and F_{fS} given in 3.3.1, may be used to derive the hogging and sagging bending moments from a direct calculation.

4.3.4 Where requested by the Owner, the extreme hogging and sagging vertical wave bending moment or extreme scaling factor, K_{fEX} , may be derived from long term 'in-service' measurements from a series of ships with similar hull forms, mass distributions and areas of operation.

4.4 Extreme vertical wave shear forces

4.4.1 The extreme vertical wave shear force, Q_{WEX} , at any position along the ship is given by:

$$Q_{WEX} = K_{fEX} Q_W \text{ kN}$$

where

Q_W is given in 3.4

K_{fEX} = the extreme scaling factor, see 4.3.

4.4.2 Alternatively the method of derivation of the extreme wave shear force may be consistent with that used to derive the bending moments.

4.5 Direct calculation procedures

4.5.1 Direct calculation procedures may be used to derive the extreme hull girder loads. LR's calculation method of the extreme hull girder loads involves derivation of the short term maximum probable responses.

4.5.2 The extreme hull girder loads, M_{WEX} and Q_{WEX} , are to be based on the probable maximum values that are likely to be experienced during severe storms. The parameters of the severe seastate, i.e. significant wave height, wave period range and duration of storm, are given in Chapter 2.

4.6 Still water shear forces and bending moments

4.6.1 The still water hogging and sagging shear force and bending moment distributions for the extreme hull girder strength assessment are to be taken as the Q_S and M_S distributions defined in 2.3 and 2.2 respectively.

4.7 Extreme hull girder design loads

4.7.1 The extreme hull girder strength design bending moment, M_{REX} , and associated shear forces, Q_{REX} , for all naval ships are to be determined as follows:

- The extreme hull girder strength design bending moment, M_{REX} , is to be taken as $(M_{WEX} + M_S)$, as defined in 4.3 and 4.6, taking into account the appropriate hogging and sagging conditions.
- The extreme hull girder strength design shear force, Q_{REX} , is to be taken as $(Q_{WEX} + Q_S)$, as defined in 4.4 and 4.6, taking into account the appropriate hogging and sagging conditions.

4.7.2 It is unnecessary to consider the effects of operating at high speed on the extreme design values for extreme hull girder strength. The requirements for bow flare impact global loads may be ignored in the derivation of M_{WEX} and Q_{WEX} .

■ Section 5 Residual strength hull girder loads

5.1 Introduction

5.1.1 The residual strength hull girder loads specified in this Section are applicable to all displacement mono-hull naval ships for which the optional **RSA1**, **RSA2** or **RSA3**, Residual Strength Assessment, notation is required. The design criteria detailed in this Section are to be used in conjunction with the residual strength assessment procedure given in Pt 6, Ch 4.4.

5.1.2 The residual strength hull girder loads are used to assess the capability of the ship's global hull girder after suffering structural damage to meet specified global strength requirements. The effects of flooding, as a consequence of structural damage, on the static global bending moments and shear forces are also to be considered.

5.2 Environmental conditions

5.2.1 The environmental design criteria for residual strength analysis given in Ch 2,3 are to be used to determine the residual strength hull girder loads.

5.2.2 The global loads for the residual strength hull girder strength assessment for unrestricted service operation, i.e. service area notation **SA1**, are typical maximum loads that are predicted in North Atlantic sea conditions that have a probability of exceedance of 20 per cent. The loads predicted for the ship in head seas at low forward speed are to be considered.

5.2.3 For other service area notations, the global loads for the hull girder residual strength assessment are typical maximum loads that are likely to be encountered within the restricted operational area in sea conditions that have a 20 per cent probability of being exceeded.

5.2.4 The designer/builder may stipulate the environmental conditions to be applied to the residual strength assessment. In which case the residual strength notation will be assessed against the required performance level.

5.2.5 The residual strength area reduction factor, K_{fRS} , is given by the following:

$$K_{fRS} = 1,1 H_{rw} L_R^{-0,48}$$

where

H_{rw} is given in Ch 2,2.3.5.

5.3 Residual strength vertical wave bending moments

5.3.1 The residual strength wave loads may be derived from the formula given below. The residual strength vertical bending moment specified here is applicable to all mono-hull ships.

5.3.2 The residual strength vertical wave bending moment, M_{WRS} , at any position along the ship is given by:

$$M_{WRS} = K_{fRS} M_W \text{ kN m}$$

where

M_W is given in 3.3

K_{fRS} = Residual strength area reduction factor, see 5.2.5.

5.3.3 Alternatively the residual strength wave loads may be derived using direct calculation methods, model tests or similar taking into account the likely range of wave periods and the environmental conditions specified in 5.2.

5.3.4 In deriving the residual strength wave bending moment, the longitudinal distribution is to be taken in accordance with the longitudinal distribution factor, D_f , see 3.3.1. Where appropriate, the hogging and sagging correction factors, F_{fH} and F_{fS} may be used to derive the hogging and sagging bending moments from a direct calculation.

5.3.5 For conventional ships, it is not normally necessary to consider the effects of flooded compartments on the wave bending moments and shear forces.

5.3.6 For bottom damage assessment as a result of grounding, the residual strength vertical wave bending moment may be based on a M_W value derived using a service area factor, f_s , for a **SA4** service area notation; provided that the ship will not be required to proceed beyond sheltered water. Similarly for other damage assessments which are restricted to sheltered water environments, there is no requirement for operation outside sheltered water areas.

5.4 Residual strength vertical wave shear forces

5.4.1 The residual strength vertical wave shear force, Q_{WRS} , at any position along the ship is given by:

$$Q_{WRS} = K_{IRS} Q_W \text{ kN}$$

where

Q_W is given in 3.4

K_{IRS} = residual strength area reduction factor, see 5.2.5.

5.4.2 Alternatively the method of derivation of residual strength wave shear forces is to be consistent with that used to derive the bending moments.

5.5 Direct calculation procedures

5.5.1 Direct calculation procedures may be used to derive the residual strength hull girder loads. LR's calculation method of the residual strength hull girder loads involves derivation of the short term maximum probable responses.

5.5.2 The residual strength hull girder loads are to be based on the probable maximum values that are likely to be experienced during moderately severe sea conditions. The parameters of the seastate, i.e. significant wave height, wave period range and duration of storm, are given in Chapter 2.

5.6 Damaged still water shear forces and bending moments

5.6.1 The still water hogging and sagging shear force, Q_{SRS} , and bending moment, M_{SRS} , distributions in the damaged condition are to be calculated taking into account any flooding of the ship as a consequence of damage. If no flooding occurs then the still water values are to be taken from 2.3 and 2.2 respectively.

If no flooding occurs

$$M_{SRS} = M_S \text{ kN m}$$

$$Q_{SRS} = Q_S \text{ kN}$$

or if flooding occurs

M_{SRS} = damaged still water bending moment, sagging (negative) and hogging (positive), in kN m

Q_{SRS} = damaged still water shear force, positive and negative, in kN.

5.6.2 The loading conditions used to derive the undamaged still water shear force and bending moment curves are to be used for the assessment of the damaged still water bending moments together with the addition of flood water in damaged compartments.

5.7 Residual strength hull girder design loads

5.7.1 The residual strength design vertical bending moment, M_{RRS} , and associated shear forces, Q_{RRS} , for all naval ships are to be determined as follows:

- The residual strength design bending moment, M_{RRS} , is to be taken as $(M_{WRS} + M_{SRS})$, as defined in 5.3 and 5.6, taking into account the appropriate hogging and sagging conditions.
- The residual strength design shear forces, Q_{RRS} , is to be taken as $(Q_{WRS} + Q_{SRS})$, as defined in 5.4 and 5.6, taking into account the appropriate hogging and sagging conditions.

5.7.2 Where it is required that the ship is to be capable of operating at high speed after damage, it may also be necessary to consider the effects of dynamic bending moments and shear forces.

Section 6 Loading guidance information

6.1 General

6.1.1 Sufficient information is to be supplied to every ship to enable the Commanding Officer or Master to arrange loading and ballasting in such a way as to avoid the creation of unacceptable stresses in the ship's structure.

6.1.2 This information should include any limiting criteria that were applied to the structural design of the ship, e.g. the maximum and minimum still water bending moments, service area notation with details of service area restrictions.

6.1.3 This information is to be provided by means of a Stability Information Book or Loading Manual and in addition, where required, by means of an approved loading instrument.

6.1.4 An Operational manual which contains the ship's assigned operational envelope is to be provided on board, see Pt 1, Ch 2,2 and Ch 1,1.

6.2 Loading Manuals or Stability Information Books

6.2.1 A Loading Manual is to be supplied to all ships where longitudinal strength calculations have been required. see Pt 6, Ch 3,4.2 and Pt 6, Ch 4,2.1. The Manual is to be submitted for approval in respect of strength aspects. Where both Loading Manual and loading instrument are supplied the Loading Manual must nevertheless be approved from the strength aspect. In this case the Manual is to be endorsed to the effect that any departures from these conditions in service are to be arranged on the basis of the loading instrument and the allowable local loadings shown in the Manual.

6.2.2 The Loading Manual is to be based on the final data of the ship and is to include well-defined lightweight distribution and buoyancy data.

6.2.3 Details of the loading conditions are to be included in the manual as applicable.

6.2.4 The Loading Manual is also to contain the following:

- (a) Values of actual and permissible still water bending moments and shear forces and where applicable limitations due to torsional loads.
- (b) The allowable local loadings for the structure.
- (c) Details of the carriage of any substances where there are constraints imposed by the use of an accepted coating in association with a system of corrosion control.
- (d) Where the ship has the capability to significantly alter the draught forward by filling water ballast tanks, then a note saying: 'Scantlings approved for minimum draught forward of...m with ballast tanks No ... filled. In heavy weather conditions the forward draught is not to be less than this value. If, in the opinion of the Commanding Officer or Master, sea conditions are likely to cause regular slamming, then other appropriate measures such as change in speed, heading or an increase in draught forward may also need to be taken.'

6.2.5 Where applicable, the Manual is also to contain the procedure for ballast exchange and sediment removal at sea and the correct use of tanks.

6.2.6 Where alteration to structure, lightweight, cargo distribution or draught is proposed, revised information is to be submitted for approval.

6.3 Loading instrument

6.3.1 In addition to a Loading Manual, an approved loading instrument is to be provided for all ships where L_R is greater than 65 m except as noted below. The following ships are exempt from this requirement:

- (a) ships with very limited possibilities for variations in the distribution of cargo and ballast;
- (b) ships with a regular or fixed operational pattern.

6.3.2 The loading instrument is to be capable of calculating shear forces and bending moments, and where necessary cargo torque, in any load or ballast condition at specified readout points and is to indicate the permissible values. The instrument is to be certified in accordance with LR procedures for the approval of longitudinal strength and stability calculation programs.

6.3.3 The instrument readout points are usually selected at the position of the transverse bulkheads or other obvious boundaries. As many readout points as considered necessary by LR are to be included, e.g. between bulkheads.

6.3.4 Where the ship has the capability to significantly alter the draught forward by filling water ballast tanks, then a notice is to be displayed on the loading instrument stating: 'Scantlings approved for minimum draught forward of... m with ballast tanks No ... filled. In heavy weather conditions the forward draught is not to be less than this value. If, in the opinion of the Commanding Officer or Master, sea conditions are likely to cause regular slamming, then other appropriate measures such as change in speed, heading or an increase in draught forward may also need to be taken.'

6.3.5 Where alterations to structure are carried out which result in a change in the lightweight or deadweight distribution, the loading instrument is to be modified accordingly and details submitted for approval.

6.3.6 The operation of the loading instrument is to be verified by the Surveyor upon installation and at Annual and Periodical Surveys as required in Pt 1, Ch 3. An Operation Manual for the instrument is to be verified as being available on board.

6.3.7 Where an onboard computer system having a longitudinal strength or a stability computation capability is provided as an Owner's option, it is recommended that the system be certified in accordance with LR's document entitled Approval of Longitudinal Strength and Stability Calculation Programs.

 - 2 **General requirements**
-

■ *Section 1*
Application

1.1 General

1.1.1 The Rules apply to sea going monohull ships of normal form, proportions and speed. Although the Rules are, in general, for steel ships of all welded construction, other materials for use in hull construction will be specially considered on the basis of the Rules.

1.1.2 An overview of the structural design process is illustrated in Fig. 1.1.1.

1.2 Equivalents

1.2.1 Alternative scantlings and arrangements may be accepted as equivalent to the Rule requirements. Details of such proposals are to be submitted for consideration in accordance with Pt 3, Ch 1,3.

1.3 Symbols and definitions

1.3.1 The symbols and definitions for use throughout this Part are as defined within the appropriate Chapters and Sections.

■ Section 2 General requirements

2.1 General

2.1.1 Limitations with regard to the application of these Rules are indicated in the various Chapters for differing ship types.

2.2 Plans to be submitted

2.2.1 Plans are to be of sufficient detail for plan approval purposes. For all areas of structure listed below the submitted plans are to show all plating thickness, stiffeners sizes and spacings, bracket arrangements and connections. Where appropriate, the plans should clearly show the allowance for corrosion margin or Owner's extra. Welding, constructional arrangements and tolerances are also to be submitted and this may be in the form of a booklet.

2.2.2 In general all items of steel structure are to be shown except where they are ineffective in supporting hull girder and local loads and do not impinge on such structure.

2.2.3 Equipment seating and supports are to be shown where they require additional stiffening and support to be incorporated in items of hull structure. In such cases the loading on the seating is also to be supplied. Generally total combined equipment weights on seating less than 0,5 tonnes need not be considered.

2.2.4 Normally the plans for each item will be able to be contained on a few sheets. Unit or production drawings will not be accepted.

2.2.5 Plans covering the following items are to be submitted:

- Midship and other critical sections showing longitudinal and transverse material.
- Profile and decks.
- Shell expansion.
- Structural continuity plan showing shadow areas of openings, longitudinally effective material and primary structural continuity material.
- Oiltight and watertight bulkheads.
- Double bottom construction.
- Pillars and girders.
- Aft end construction.
- Engine room construction.
- Engine and thrust seatings.
- Fore end construction.
- Storing routes.
- Deckhouses and superstructures.
- Propeller brackets and appendages.
- Rudder, stock and tiller.
- Equipment.
- Loading Manuals and stability information booklets, preliminary and final (where applicable).
- Scheme of corrosion control (where applicable) including; location of anodes, method of attachment, details of cathodic protection system.
- Ice strengthening.
- Welding schedule.

- Hull penetration plans including scuppers, sea connections, overboard discharges, arrangements and fittings.
- Support structure for masts, derrick posts, cranes, RAS points, weapons handling/stowage or machinery lifting point and large items of equipment.
- Bilge keels showing material grades, welded connections and detail design.
- Flight deck arrangement and structure.

Additionally, for inwater survey the following plans and information are to be submitted:

- Details showing how rudder pintle and bush clearances are to be measured and how the security of the pintles in their sockets are to be verified with the ship afloat.
- Details showing how stern bush clearances are to be measured with the ship afloat.
- Details of high resistant paint, for information only.

2.2.6 The following supporting documents are to be submitted:

- General arrangement.
- Capacity plan.
- Lines plan or equivalent.
- Dry-docking plan.
- Towing and mooring arrangements.

2.2.7 The following supporting calculations are to be submitted:

- Equipment number.
- Hull girder still water and dynamic bending moments and shear forces as applicable.
- Midship section and other critical section modulus.
- Structural items in the aft end, midship and fore end regions of the ship.

2.2.8 In the process of plan approval and from Fatigue Design Assessment and Structural Design Assessment certain critical locations may be identified which require special attention. Plans and records of production are to be submitted in accordance with the construction monitoring procedures associated with the notation **CM**.

2.2.9 Where the specific notations are applied for additional plans will be required.

2.3 Plans to be supplied to the ship

2.3.1 To facilitate the ordering of materials for repairs, plans listed in 2.4.1 are to be carried on board the ship. They are to clearly indicate the disposition and grades (other than Grade A) of hull structural steel, the extent and location of higher tensile steel together with details of specification and mechanical properties, and recommendations for welding, working and treatment of these steels.

2.3.2 Similar information is to be provided where aluminium alloy or other materials are used in the construction.

2.3.3 A copy of the final Loading Manual or Stability Information booklet, when approved, is to be placed on board the ship.

2.3.4 Details of any corrosion control system fitted are to be placed on board the ship.

2.3.5 Approved plans and information covering the items detailed in 2.2.5 relating to inwater survey are to be placed on board the ship.

2.4 Novel features

2.4.1 Where the proposed construction of any part of the hull or machinery is of novel design, or involves the use of unusual material, or where experience, in the opinion of Lloyd's Register (hereinafter referred to as 'LR'), has not sufficiently justified the principle or mode of application involved, special tests or examinations before and during service may be required. In such cases a suitable notation may be entered in the *Register Book*.

2.5 Enhanced scantlings

2.5.1 Where scantlings in excess of the approved Rule requirement are fitted at defined locations as corrosion margins or for other purposes, as specified by the Owner, a notation **ES**, 'Enhanced Scantlings', will be assigned and it will be accompanied by a list giving items to which the enhancement has been applied and the increase in scantling. For example, the item 'bottom shell (strakes A, B, C, D)+2' will indicate that an extra 2 mm has been fitted to the bottom shell of the ship for the particular strakes listed, *see also* Ch 6,2.10. In addition the plans submitted for approval are to contain the enhanced scantling plan, together with the nominal thickness, less the enhancement adjacent, in brackets.

2.6 Direct calculations

2.6.1 Direct calculations may be specifically required by the Rules and may be required for ships having novel design features or in support of alternative arrangements and scantlings. LR may, when requested, undertake calculations on behalf of designers and make recommendations with regard to suitability of any required model tests.

2.7 Exceptions

2.7.1 Ships of unusual form, proportions or speed, with unusual features, or for special or restricted service, not covered specifically by the Rules, will receive individual consideration based on the general requirements of the Rules.

Section

- 1 **General**
- 2 **Structural design**
- 3 **Buckling**
- 4 **Vibration control**
- 5 **Dynamic loading**

■ Section 1 General

1.1 General

1.1.1 The guidance notes, information and formulae contained within this Chapter are to be used in the scantling determination (Chapter 3) and total load assessment.

1.2 Equivalents

1.2.1 Lloyd's Register (hereinafter referred to as 'LR') will consider direct calculations for the derivation of scantlings as an alternative and equivalent to those derived by Rule requirements in accordance with Pt 3, Ch 1,3.

1.3 Symbols and definitions

1.3.1 The symbols used in this Chapter are defined below and in the appropriate Section:

- Z = section modulus of stiffening member, in cm^3
- I = moment of inertia, in cm^4
- A_w = shear area of stiffener web, in cm^2
- l = overall length of stiffener or primary member, in metres
- l_e = effective span length, in metres, as defined in 2.6
- p = design pressure, in kN/m^2
- s = secondary stiffener spacing, in mm
- S = primary stiffener spacing, in metres
- t_p = plating thickness, in mm
- β = panel aspect ratio correction factor as defined in 2.5
- γ = convex curvature correction factor as defined in 2.4
- k_s = higher tensile steel factor for local loads, see Ch 5,2.1.1
- k_L = higher tensile steel factor for global loads, see Ch 5,2.1.2
- σ_o = guaranteed minimum yield strength of the material, in N/mm^2
- τ_o = shear strength of the material in N/mm^2
- $= \frac{\sigma_o}{\sqrt{3}}$
- E = modulus of elasticity, in N/mm^2 .

1.4 Rounding policy for Rule plating thickness

1.4.1 Where plating thicknesses as determined by the Rules require to be rounded then this should be carried out to the nearest full or half millimetre, with thicknesses 0,75 and 0,25 being rounded up.

1.5 Material properties

1.5.1 The basic grade of steel used in the determination of the Rule scantling requirements is taken as mild steel with the following mechanical properties:

- (a) Yield strength (minimum) $\sigma_o = 235 \text{ N/mm}^2$
- (b) Tensile strength = 400–490 N/mm^2
- (c) Modulus of elasticity, $E = 200 \times 10^3 \text{ N/mm}^2$.

1.6 Higher tensile steel

1.6.1 Steels having a yield stress not less than 265 N/mm^2 are regarded as higher tensile steels.

1.6.2 Where higher tensile steels are to be used, due allowance is given in the determination of the Rule requirement for plating thickness, stiffener section modulus, inertia and cross-sectional area by the use of higher tensile steel correction factors k_s and k_L or f_{hts} . Normally, this allowance is included in the appropriate scantling requirements. Where this is not the case, the following correction factors may be applied:

- (a) Plating thickness factor = $\sqrt{k_s}$ for local loads
 $\sqrt{k_L}$ for global loads
- (b) Section modulus and cross sectional area factor = k_s where
 k_s and k_L are defined in 1.3.1
 f_{hts} is defined in Ch 5,1.3.

1.6.3 Higher tensile steel may be used for both deck and bottom structures or deck structure only. Where fitted for global strength purposes, it is to be used for the whole of the longitudinal continuous material for the following vertical distances:

- (a) z_{htd} below the line of deck at side
$$z_{htd} = \left(1 - \frac{k_L}{F_D}\right) z_D \text{ m}$$
- (b) z_{htb} above the top of keel
$$z_{htb} = \left(1 - \frac{k_L}{F_B}\right) z_B \text{ m}$$

In the above formulae F_D and F_B are to be taken not less than k_L where

F_D and F_B are defined in Ch 3,3.6. Note the F_D and F_B factors derived in Ch 3,3.6 for NS1 ships may also be applied to ship types NS2 and NS3

z_D and z_B are the vertical distances, in m, from the transverse neutral axis of the hull cross-section to the uppermost continuous longitudinally effective material and to the top of the keel respectively

k_L is defined in 1.3.1.

1.6.4 The designer should note that there is no increase in fatigue performance with the use of higher tensile steels.

Section 2 Structural design

2.1 General

2.1.1 This Section gives the basic principals to be adopted in determining the Rule structural requirements given in Chapter 3.

2.1.2 For derivation of scantlings of stiffeners, beams, girders, etc., the formulae in the Rules are normally based on elastic or plastic theory using simple beam models supported at one or more points and with varying degrees of fixity at the ends, associated with an appropriate concentrated or distributed load.

2.1.3 The stiffener, beam or girder strength is defined by a section modulus and moments of inertia requirements. In addition there are local requirements for web thickness or flange thickness.

2.1.4 Some of the details given in this Section will be specially considered for ships with a military distinction notation **MD**.

2.2 Effective width of attached plating, b_e

2.2.1 The effective geometric properties of rolled or built sections are to be calculated directly from the dimensions of the section and associated effective area of attached plating. Where the web of the section is not normal to the actual plating, and the angle exceeds 20° , the properties of the section are to be determined about an axis parallel to the attached plating.

2.2.2 For stiffening members, the geometric properties of rolled or built sections are to be calculated in association with an effective area of attached load bearing plating of thickness t_p , in mm, and a breadth b_e , in mm.

2.2.3 The effective breadth of attached plating to secondary stiffener members b_e , is to be taken as:

$$b_e = 40t_p \text{ mm}$$

or 600 mm, whichever is the greater
or the actual spacing of stiffeners in mm, whichever is the lesser.

2.2.4 The effective breadth of attached plating to primary support members (girders, transverses, webs, etc.), b_e , is to be taken as:

$$b_e = 300S \left(\frac{I}{S} \right)^{2/3} \text{ mm but is not to exceed } 1000S.$$

where S and I are as defined in 1.3.1.

2.3 Section properties

2.3.1 The dimensions of rolled and built stiffeners are illustrated in Fig. 2.2.1. The section properties of stiffeners can be based on the illustrated dimensions if manufacturer's information is not available.

2.3.2 The effective section properties of a corrugation over a spacing b , see Fig. 2.2.2, is to be calculated from the dimensions and, for symmetrical corrugations, may be taken as:

Section modulus

$$Z = \frac{d_w}{6000} (3b_e t_p + c t_w) \text{ cm}^3$$

Moment of inertia

$$I = \frac{Z}{10} \left(\frac{d_w}{2} \right) \text{ cm}^4$$

Shear area

$$A_w = \frac{d_w t_w}{100} \text{ cm}^2$$

where

d_w , b_f , t_p , c and t_w are measured, in mm, and are as shown in Fig. 2.2.2. The value of b_e is to be taken not greater than b_f or:

$$50t_p \sqrt{k_s} \text{ for welded corrugations}$$

$$60t_p \sqrt{k_s} \text{ for cold formed corrugations}$$

k_s = local high strength steel factor, see 1.3.1

The value of θ is to be not less than 40° .

2.3.3 The section properties of a double skin primary member over a spacing b , see Fig. 2.2.3, may be calculated as:

Section modulus

$$Z = \frac{d_w}{6000} (6fb t_p + d_w t_w) \text{ cm}^3$$

Moment of inertia

$$I = \frac{Z}{10} \left(\frac{d_w}{2} \right) \text{ cm}^4$$

Shear area

$$A_w = \frac{d_w t_w}{100} \text{ cm}^2$$

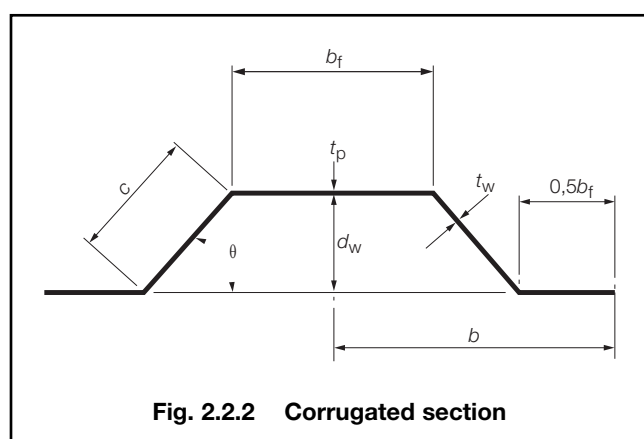

where

d_w , b , t_p and t_w are measured, in mm, and are as shown in Fig. 2.2.2

$$f = 0,3 \left(\frac{1000I}{b} \right)^{2/3} \text{ mm but is not to exceed } 1,0$$

NOTE

If the plate flanges of the double bulkhead are of unequal thicknesses, then the equations in 2.3.4 may be used with $b_e = b_f = fb$.

2.3.4 The effective section properties of a built section, see Fig. 2.2.1, may be taken as:

Section modulus of flange

$$Z_f = \frac{A_f d_w}{10} + \frac{A_w d_w}{60} \left(1 + \frac{2(A_p - A_f)}{2A_p + A_w} \right) \text{ cm}^3$$

Neutral axis of section above plating

$$x_{na} = \frac{d_w}{A} \left(\frac{A_w}{2} + A_f \right) \text{ mm}$$

Moment of inertia about neutral axis

$$I = \frac{Z_f}{10} (d_w - x_{na}) \text{ cm}^4$$

Section modulus at plate

$$Z_p = 10 \frac{I}{x_{na}} \text{ cm}^3$$

Shear area

$$A_w = \frac{d_w t_w}{100} \text{ cm}^2$$

where

- A_f = area of face plate of flange in cm^2
 A_w = area of web plating in cm^2
 A_p = area of attached plating in cm^2 , see 2.3.5
 $A = A_f + A_w + A_p$
 d_w = the depth, in mm, of the web between the inside of the face plate and the attached plating. Where the member is at right angles to a line of corrugations, the minimum depth is to be taken
 b_e = effective breadth of attached plating, in mm, see 2.2
 b_f , t_f , d_w , t_w and t_p are in mm and are illustrated in Fig. 2.2.1.

2.3.5 The geometric properties of primary support members (i.e. girders, transverses, webs, stringers, etc.) attached to corrugated bulkheads, are to be calculated in association with an effective area of attached load bearing plating, A_p , determined as follows:

- (a) For a member attached to corrugated plating and parallel to the corrugations:
 $A_p = b_f t_p / 100 \text{ cm}^2$
 (See Fig. 2.2.2).
- (b) For a member attached to corrugated plating and at right angles to the corrugations:
 A_p is to be taken as equivalent to the area of the face plate of the member.

2.4 Convex curvature correction

2.4.1 The thickness of plating as determined by the Rules may be reduced where significant curvature exists between the supporting members. In such cases a plate curvature correction factor may be applied:

- γ = plate curvature factor
 $= 1 - d_c/s_c$, and is not to be taken as less than 0,7
 d_c = the distance, in mm, measured perpendicularly from the chord length, s_c , (i.e. spacing in mm) to the highest point of the curved plating arc between the two supports, see Fig. 2.2.4.

Fig. 2.2.4 Convex curvature

2.5 Aspect ratio correction

2.5.1 The thickness of plating as determined by the Rules may be reduced when the panel aspect ratio is taken into consideration. In such cases a panel aspect ratio correction factor may be applied:

- β = aspect ratio correction factor
 $= A_R (1 - 0,25A_R)$ for $A_R \leq 2$
 $= 1$ for $A_R > 2$
 A_R = panel aspect ratio
 $= \text{panel length/panel breadth.}$

2.6 Determination of span length

2.6.1 The effective span length, l_e , of a stiffening member is generally less than the overall length, l , by an amount which depends on the design of the end connections. The span points, between which the value of l_e is measured, are to be determined as follows:

- (a) For rolled or built-up secondary stiffening members:
 The span point is to be taken at the point where the depth of the end bracket, measured from the face of the secondary stiffening member, is equal to the depth of the member, see Fig. 2.2.5. Where there is no end bracket, the span point is to be measured between primary member webs.
- (b) For primary support members:
 The span point is to be taken at a point distant, b_s , from the end of the member

$$b_s = b_b \left(1 - \frac{d_w}{d_b} \right)$$

where

b_s , b_b , d_w and d_s are as shown in Fig. 2.2.5.

2.6.2 Where the stiffening member is inclined to a vertical or horizontal axis and the inclination exceeds 10° , the span is to be measured along the member.

2.6.3 Where the stiffening member is curved then the span is to be taken as the effective chord length between span points.

2.6.4 It is assumed that the ends of stiffening members are substantially fixed against rotation and displacement. If the arrangement of supporting structure is such that this condition is not achieved, consideration will be given to the effective span to be used for the stiffener.

2.7 Plating general

2.7.1 The equation given in this sub-Section is to be used to determine the thickness of plating for NS2 and NS3 ship types. The design pressure, p , is given in the Tables in Ch 3,4 for each structural component and is to be used with the limiting stress coefficient, see Ch 5,3.1.1, to determine the required plate thickness.

2.7.2 The requirements for the thickness of plating, t_p , is, in general, to be in accordance with the following:

$$t_p = 22,4s \gamma \beta \sqrt{\frac{\rho}{f_\sigma \sigma_o}} \times 10^{-3} \text{ mm}$$

where

- ρ is the design pressure, in kN/m², given in Ch 3,4
- f_σ = limiting stress coefficient for local plate bending for the plating area under consideration given in Ch 5,3, σ_o column in Table 5.3.2, see also Ch 5,3.1.1
- $s, \gamma, \beta, \sigma_o$ are as defined in 1.3.1.

2.8 Stiffening general

2.8.1 The equations given in this sub-Section are to be used to derive the scantling requirements for stiffeners. The design pressure, ρ , is given in the Tables in Ch 3,4 for each structural component and is to be used with the limiting stress coefficient, see Ch 5,3.1.1, to determine the required section modulus, web area and inertia of the stiffeners.

2.8.2 The requirements for section modulus, inertia and web area of stiffening members subjected to pressure loads are, in general, to be in accordance with the following:

(a) For secondary members:

Section modulus:

$$Z = \frac{\phi_z \rho s l_e^2}{f_\sigma \sigma_o} \text{ cm}^3$$

Inertia:

$$I = \frac{100 \phi_I \rho s l_e^3}{f_\delta E} \text{ cm}^4$$

Web area:

$$A_w = \frac{\phi_A \rho s l_e}{100 f_\tau \tau_o} \text{ cm}^2$$

(b) For primary members:

Section modulus:

$$Z = \frac{10^3 \phi_z \rho s l_e^2}{f_\sigma \sigma_o} \text{ cm}^3$$

Inertia:

$$I = \frac{10^5 \phi_I \rho s l_e^3}{f_\delta E} \text{ cm}^4$$

Web area:

$$A_w = \frac{10 \phi_A \rho s l_e}{f_\tau \tau_o} \text{ cm}^2$$

where

- ρ is the design pressure, in kN/m², given in Ch 3,4
- ϕ_z = section modulus coefficient dependent on the loading model assumption taken from Table 2.2.1
- f_σ = limiting local stiffener bending stress coefficient for stiffening member given in Ch 5,3.1.1, column σ_x in Table 5.3.2
- ϕ_I = inertia coefficient dependent on the loading model assumption taken from Table 2.2.1
- f_δ = limiting inertia coefficient for stiffener member given in Ch 5,3.1.1, column f_δ in Table 5.3.2
- ϕ_A = web area coefficient dependent on the loading model assumption taken from Table 2.2.1
- f_τ = limiting web area coefficient for stiffener member given in Ch 5,3.1.1, column f_τ in Table 5.3.2
- E, S, s, l_e, σ_o and τ_o are as defined in 1.3.1.

2.8.3 The requirements for section modulus, inertia and web area of stiffening members subjected to point loads are, in general, to be in accordance with the following:

For primary and secondary members:

Section modulus:

$$Z = \frac{10^3 \phi_z F l_e}{f_\sigma \sigma_o} \text{ cm}^3$$

Inertia

$$I = \frac{10^5 \phi_I F l_e^2}{f_\delta E} \text{ cm}^4$$

Web area

$$A_w = \frac{10 \phi_A F}{f_\tau \tau_o} \text{ cm}^2$$

where

- F is the design point load, in kN
- ϕ_z = section modulus coefficient dependent on the loading model assumption taken from Table 2.2.1

f_σ = limiting local stiffener bending stress coefficient for stiffening member given in Ch 5,3.1.1, column σ_x in Table 5.3.2

ϕ_I = inertia coefficient dependent on the loading model assumption taken from Table 2.2.1

f_δ = limiting inertia coefficient for stiffener member given in Ch 5,3.1.1, column f_δ in Table 5.3.2

ϕ_A = web area coefficient dependent on the loading model assumption taken from Table 2.2.1

f_τ = limiting web area coefficient for stiffener member given in Ch 5,3.1.1, column f_τ in Table 5.3.2

E, l_e , and σ_o are as defined in 1.3.1.

2.8.4 Where a stiffener is subjected to a combination of loads, then the requirements are to be based on the linear superposition of those loads onto the stiffener. For example the section modulus requirement for a UDL load and a point load will be as follows:

$$Z = \frac{\phi_z \rho s l_e^2}{f_\sigma \sigma_o} + \frac{10^3 \phi_z F l_e}{f_\sigma \sigma_o} \text{ cm}^3$$

2.9 Proportions of stiffener sections

2.9.1 From structural stability and local buckling considerations, the proportions of stiffening members are, in general, to be in accordance with Table 2.2.2. For primary member minimum thickness see Table 6.5.1 in Pt 6, Ch 6.

2.9.2 Primary members of asymmetrical section are to be supported by tripping brackets at alternate secondary members. If the section is symmetrical, the tripping brackets may be four spaces apart.

2.9.3 Tripping brackets are in general required to be fitted at the toes of end brackets and in way of heavy or concentrated loads such as the heels of pillars.

2.9.4 Where the ratio of unsupported width of face plate (or flange) to its thickness exceeds 16:1, the tripping brackets are to be connected to the face plate and on members of symmetrical section, the brackets are to be fitted on both sides of the web.

2.9.5 Intermediate secondary members may be welded directly to the web or connected by lugs in accordance with Ch 6,5.3.

2.10 Grillage structures

2.10.1 For complex girder systems, a complete structural analysis using numerical methods may have to be performed to demonstrate that the stress levels are acceptable when subjected to the most severe and realistic combination of loading conditions intended.

2.10.2 General or special purpose computer programs or other analytical techniques may be used provided that the effects of bending, shear, axial and torsion are properly accounted for and the theory and idealisation used can be justified.

Table 2.2.1 Section modulus, inertia and web area coefficients for different load models (see continuation)

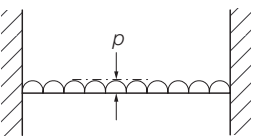

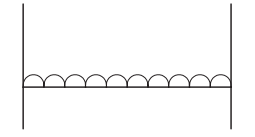

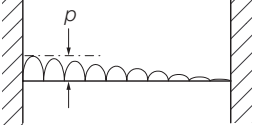

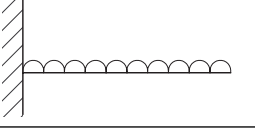

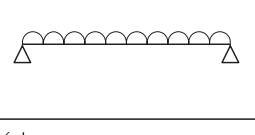

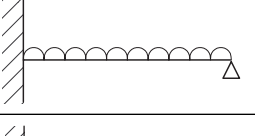

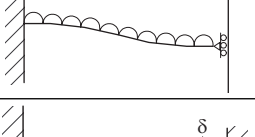

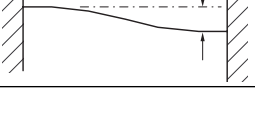

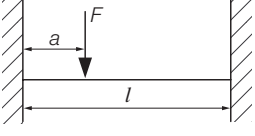

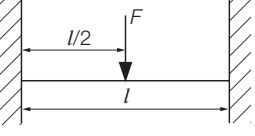

Load model	Position (j)			(j)	Web area coefficient ϕ_A	Section modulus coefficient ϕ_Z	Inertia coefficient ϕ_I	Application
	1 end	2 midspan	3 end					
(A)				1 2 3	1/2 — 1/2	1/12 -1/24 1/12	— 1/384 —	Primary and other members where the end fixity is considered encastre Uniformly distributed pressure
(B)				1 2 3	1/2 — 1/2	1/10 -1/10 1/10	— 1/288 —	Local, secondary and other members where the end fixity is considered to be partial Uniformly distributed pressure
(C)				1 2 3	7/20 — 3/20	1/20 — 1/30	— 1/764 —	Linearly varying distributed pressure Built in both ends
(D)				1 2 3	1 — —	1/2 — —	1/8 — —	Uniformly distributed pressure cantilevered beam
(E)				1 2 3	1/2 — 1/2	— 1/8 —	— 5/384 —	Uniformly distributed pressure Simply supported Hatch covers, glazing and other members where the ends are not fixed
(F)				1 2 3	5/8 — 3/8	1/8 -9/128 —	— 1/185 —	Uniformly distributed pressure Cantilever plus simple support
(G)				1 2 3	1 — —	1/3 0 1/3	0 — 1/24	Uniformly distributed pressure Built in one end. Other end free to deflect but slope restrained

(I)				1 2 3	$\frac{(l-a)^2(l+2a)}{l^3}$ — $\frac{a^2(3l-2a)}{l^3}$	$\frac{a(l-a)^2}{l^3}$ $-\frac{2a^2(l-a)^2}{l^4}$ $\frac{a^2(l-a)}{l^3}$	— $\frac{2(l-a)^2 a^3}{3(l+2a)^2 l^3}$ —	Single point load, load anywhere in the span Built in at both ends
				1 2 3	1/2 — 1/2	1/8 -1/8 1/8	— 1/192 —	Single point load in the centre of the span Built in at both ends

Table 2.2.1 Section modulus, inertia and web area coefficients for different load models (conclusion)

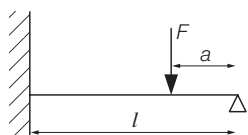

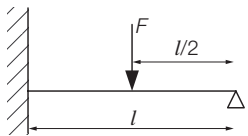

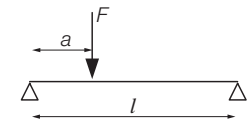

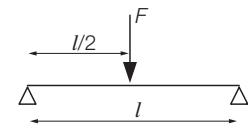

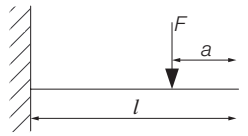

Load model	Position (j)			(j)	Web area coefficient ϕ_A	Section modulus coefficient ϕ_Z	Inertia coefficient ϕ_I	Application
	1 end	2 midspan	3 end					
(J)				1	$\frac{a(3l^2 - a^2)}{2l^3}$	$\frac{a(l^2 - a^2)}{2l^3}$	—	Single point load, load anywhere in the span
				2	—	$\frac{-a(l - a)^2(2l + a)}{2l^4}$	$\frac{a(l - a)^2}{6l^3} \left(\frac{a}{2l + a} \right)^{1/2}$	Cantilever plus simple support
				3	$\frac{(l - a)^2(2l + a)}{2l^3}$	—	—	
				1	11/16	3/16	—	Single point load in the centre of the span
				2	—	5/32	1/108	Cantilever plus simple support
				3	5/16	—	—	
(K)				1	$\frac{l - a}{l}$	—	—	Single point load, load anywhere in the span
				2	—	$\frac{-a(l - a)}{l^2}$	$\frac{a}{3l^4} \left(\frac{l^2 - a^2}{3} \right)^{3/2}$	
				3	$\frac{a}{l}$	—	—	Simply supported
				1	1/2	—	—	Single point load in the centre of the span
				2	—	-1/4	1/48	Simply supported
				3	1/2	—	—	
(L)				1	1	$\frac{(l - a)}{l}$	—	Single point load anywhere in the span
				2	—	—	—	
				3	—	—	$\frac{2l^3 - 3l^2 a + a^3}{l^3}$	Cantilevered beam
NOTE In all cases, the coefficient that results in the most pessimistic requirement is to be used in the stiffening equations in 2.8.								

Table 2.2.2 Stiffener proportions

Type of stiffener	Requirement
(1) Flat bar continuous intercostal	Minimum web thickness: $t_w = d_w/18 \geq 2,5 \text{ mm}$ $t_w = d_w/15 \geq 2,5 \text{ mm}$
(2) Rolled or built sections	(a) Minimum web thickness: $t_w = d_w/60 \geq 2,5 \text{ mm}$ (b) Maximum unsupported face plate (or flange) width: $b_f = 16t_f$
Symbols	
t_w = web thickness of stiffener with unstiffened webs, in mm d_w = web depth of stiffener, in mm b_f = face plate (or flange) unsupported width, in mm t_f = face plate (or flange) thickness, in mm	

2.10.3 In general, grillages consisting of slender girders may be idealised as frames based on beam theory provided proper account of the variations of geometric properties is taken. For cases where such an assumption is not applicable, finite element analysis or equivalent methods may have to be used.

Section 3 Buckling

3.1 General

3.1.1 This Section contains the requirements for buckling control of plate panels subject to in-plane compressive and/or shear stresses and buckling control of primary and secondary stiffening members subject to axial compressive and shear stresses.

3.1.2 The requirement for buckling control of plate panels is contained in 3.3 to 3.6. The requirements for secondary stiffening members are contained in 3.7 to 3.8. The requirements for primary members are contained in 3.9 and 3.10.

3.1.3 In general all areas of the structure are to meet the buckling strength requirements for the design stresses. The design stresses are to be taken as the global hull girder bending and shear stresses derived in accordance with Chapter 4. In addition, where the structural member is subject to local compressive loads, then the design stresses are to be based on these loads.

3.1.4 The buckling requirements are to be met using the net scantlings, hence any additional thickness for corrosion margin or Owners extra is not included in scantlings used to assess the buckling performance.

3.2 Symbols

3.2.1 The symbols used in this Section are defined below and in the appropriate sub-Section:

A_R = panel aspect ratio

$$= \frac{a}{b}$$

a = panel length, i.e. parallel to direction of compressive stress being considered, in mm

b = panel breadth, i.e. perpendicular to direction of compressive stress being considered, in mm

S_p = span of primary members, in metres

σ_e = elastic compressive buckling stress, in N/mm²

σ_c = critical compressive buckling stress, including the effects of plasticity where appropriate, in N/mm²

τ_e = elastic shear buckling stress, in N/mm²

τ_c = critical shear buckling stress, in N/mm²

$$b_{eb} = \text{lesser of } 1,9t_p \sqrt{\frac{E}{\sigma_o}} \text{ or } 0,8b \text{ mm}$$

A_{te} = cross-sectional area of secondary stiffener, in cm², including an effective breadth of attached plating, b_{eb}

s = length of shorter edge of plate panel, in mm (typically the spacing of secondary stiffeners)

l = length of longer edge of plate panel, in metres

S = spacing of primary member, in metres (measured in direction of compression)

3.3 Plate panel buckling requirements

3.3.1 The Section gives methods for evaluating the buckling strength of plate panels subjected to the following load fields:

- (a) uni-axial compressive loads;
- (b) shear loads;
- (c) bi-axial compressive loads;
- (d) uni-axial compressive loads and shear loads;
- (e) bi-axial compressive loads and shear loads.

3.3.2 The plate panel buckling requirements will be satisfied if the buckling interaction equations given in Table 2.3.2 for the above load fields are complied with.

3.3.3 The critical compressive buckling stresses and critical shear buckling stresses required for Table 2.3.2 are to be derived in accordance with 3.4.

3.3.4 The buckling factors of safety λ_σ and λ_τ required by Table 2.3.2 are to be extracted from Chapter 5 for the structural member concerned.

3.3.5 For all structural members which contribute to the hull girder strength, the plate panel buckling requirements for uni-axial compressive loads, Table 2.3.2(a), and shear loads, Table 2.3.2(b) are to be complied with.

3.3.6 In addition to 3.3.5, structural members which are subjected to local compressive loads and/or shear loads are to be verified using the plate panel buckling requirements in Table 2.3.2(c) to (e).

3.3.7 However, where some members of the structure have been designed such that elastic buckling of the plate panel between the stiffeners is allowable, then the requirements of 3.5 must be applied to the buckling analysis of the stiffeners supporting the plating. In addition, panels which do not satisfy the panel buckling requirements must be indicated on the appropriate drawing and the effect of these panels not being effective in transmitting compressive loads taken into account for the hull girder strength calculation, see Ch 4, 1.4.7 and 1.4.8.

3.3.8 In general the plate panel buckling requirements for more complex load fields, see 3.3.1(c), (d) and (e), are to be complied with. Where this is not possible, due to elastic buckling of the panel, then the critical buckling stress, σ_c , may be based on the ultimate collapse strength of the plating, σ_u from 3.5.4, instead of the elastic buckling stress, σ_e , derived in 3.3.5. In addition, the requirements of the 3.5 are to be met for the supporting secondary stiffeners and primary members.

3.4 Derivation of the buckling stress for plate panels

3.4.1 The critical compressive buckling stress, σ_c , for a plate panel subjected to uni-axial in-plane compressive loads is to be derived in accordance with Table 2.3.1(a).

3.4.2 The critical shear buckling stress, τ_c , for a plate panel subjected to pure in-plane shear load is to be derived in accordance with Table 2.3.1(b).

Table 2.3.1 Buckling stress of plate panels

Mode	Elastic buckling stress, N/mm ² see Note	
(a) Uni-axial compression: (i) Long narrow panels, loaded on the narrow edge (ii) Short broad panels, loaded on the broad edge	$A_R \geq 1$ $\sigma_e = 3,62\varphi E \left(\frac{t_p}{b} \right)^2$ $A_R < 1$ $\sigma_e = 0,9C \varphi \left(\frac{b}{a} + \frac{a}{b} \right)^2 E \left(\frac{t_p}{b} \right)^2$	
(b) Pure shear:	$\tau_e = 3,62 \left(1,335 + \left(\frac{u}{v} \right)^2 \right) E \left(\frac{t_p}{u} \right)^2$ NOTE u is to be the minimum dimension	
NOTE The critical buckling stresses, in N/mm ² , are to be derived from the elastic buckling stresses as follows: $\sigma_c = \sigma_e$ when $\sigma_e < \frac{\sigma_o}{2}$ $= \sigma_o \left(1 - \frac{\sigma_o}{4\sigma_e} \right)$ when $\sigma_e \geq \frac{\sigma_o}{2}$ $\tau_c = \tau_e$ when $\tau_e < \frac{\tau_o}{2}$ $= \tau_o \left(1 - \frac{\tau_o}{4\tau_e} \right)$ when $\tau_e \geq \frac{\tau_o}{2}$ σ_c is defined in 3.2.1 σ_o is defined in 1.3.1		
Symbols and definitions		
A_R = panel aspect ratio, see 3.2.1 σ_e = elastic compressive buckling stress, in N/mm ² τ_e = elastic shear buckling stress, in N/mm ² a and b are the panel dimensions in mm, see figures above t_p = thickness of plating, in mm φ = stress distribution factor for linearly varying compressive stress across plate width $= 0,47\mu^2 - 1,4\mu + 1,93$ for $\mu \geq 0$ $= 1$ for constant stress $\mu = \frac{\sigma_{d1}}{\sigma_{d2}}$ where σ_{d1} and σ_{d2} are the smaller and larger average compressive stresses respectively E = Young's Modulus of elasticity of material, in N/mm ² C = stiffener influence factor for panels with stiffeners perpendicular to compressive stress $= 1,3$ when plating stiffened by floors or deep girders $= 1,21$ when stiffeners are built up profiles or rolled angles $= 1,10$ when stiffeners are bulb flats $= 1,05$ when stiffeners are flat bars σ_d and τ_d are the design compressive and design shear stresses in the direction illustrated in the figures. With linearly varying stress across the plate panel, σ_d is to be taken as σ_{d2}		

3.4.3 For welded plate panels with plating thicknesses below 8 mm, the critical compressive buckling stress is to be reduced to account for the presence of residual welding stresses. The critical buckling stress for plating is to be taken as the minimum of:

$$\sigma_{cr} = \sigma_e - \sigma_r$$

σ_c derived using 3.4.1
where

$$\sigma_r = \text{reduction in compressive buckling stress due to residual welding stresses}$$

$$= \frac{2 \beta_{RS} \sigma_o}{b/t_p}$$

β_{RS} = residual stress coefficient dependent on type of weld (average value of β_{RS} to be taken as 3)

t_p and σ_o are defined in 1.3.1

σ_c is derived in 3.4.1

b is defined in 3.2.1.

3.4.4 In general the effect of lateral loading on plate panels (for example hydrostatic pressure on bottom shell plating) may be neglected and the critical buckling stresses calculated considering the in-plane stresses only.

3.4.5 Unless indicated otherwise, the effect of initial deflection on the buckling strength of plate panels may be ignored.

3.5 Additional requirements for plate panels which buckle elastically

3.5.1 Elastic buckling of plate panels between stiffeners occurs when both the following conditions are satisfied:

(a) The design compressive stress, σ_d , is greater than the elastic buckling stress of the plating, σ_e ,

$$\sigma_d > \sigma_e$$

(b) The elastic buckling stress is less than half the yield stress

$$\sigma_e \leq \frac{\sigma_o}{2}$$

3.5.2 Elastic buckling of local plating between stiffeners, including girders or floors etc, may be allowed if all of the following conditions are satisfied:

(a) The critical buckling stress of the stiffeners in all buckling modes is greater than the axial stress in the stiffeners after redistribution of the load from the elastically buckled plating into the stiffeners, hence

$$\frac{\sigma_{de}}{\sigma_{c(i)}} \leq \frac{1}{\lambda_\sigma}$$

where $i = (a), (t), (w)$ or (f)

(b) Maximum predicted loadings are used in the calculations.

(c) Functional requirements will allow a degree of plating deformation.

where

σ_{de} is the stiffener axial stress given in 3.5.5

$\sigma_{c(i)}$ is given by Table 2.3.3

i is a, t, w or f depending on the mode of buckling.

λ_σ is the buckling factor of safety given in Table 5.3.2 in Chapter 5.

3.5.3 The effective breadth of attached plating for stiffeners, girder or beams that is to be used for the determination of the critical buckling stress of the stiffeners attached to plating which buckles elastically is to be taken as follows:

$$b_{eu} = \frac{b \sigma_u}{\sigma_o} \text{ mm}$$

where

σ_u = ultimate buckling strength of plating as given in 3.5.4

σ_o is defined in 1.3.1

b_{eu} = effective panel breadth perpendicular to direction of compressive stress being considered

b is given in 3.2.1.

3.5.4 The ultimate buckling strength of plating, σ_u , which buckles elastically, may be determined as follows:

(a) shortest edge loaded, i.e. $A_R \geq 1$:

$$\sigma_u = \sigma_o \left(\frac{1,9}{\Omega} - \frac{0,8}{\Omega^2} \right) \text{ N/mm}^2$$

(b) longest edge loaded i.e. $A_R < 1$:

$$\sigma_u = \frac{1,77 \sigma_o A_R^{0,78}}{\Omega} \text{ N/mm}^2$$

where

$$\Omega = \frac{s}{t_p} \sqrt{\frac{\sigma_o}{E}}$$

A_R and s are defined in 3.2.1.

t_p, E and σ_o are defined in 1.3.1.

3.5.5 The axial stress in stiffeners attached to plating which is likely to buckle elastically is to be derived as follows:

$$\sigma_{de} = \sigma_d \frac{A_t}{A_{tb}}$$

where

σ_d is the axial stress in the stiffener when the plating can be considered fully effective

$$A_t = A_s + \frac{bt}{100} \text{ cm}^2$$

$$A_{tb} = A_s + \frac{b_{eu} t}{100} \text{ cm}^2$$

where

b and b_{eu} are given in 3.5.3

t is the plating thickness, in mm

A_s is the stiffener area in cm^2 .

3.6 Shear buckling of stiffened panels

3.6.1 The shear buckling capability of longitudinally stiffened panels between primary members is to satisfy the following condition:

$$\frac{\tau_d}{\tau_c} \leq \frac{1}{\lambda_\tau}$$

where

τ_c is derived from 3.6.3

τ_d is the design shear stress

λ_τ is given in Table 5.3.2 in Chapter 5.

3.6.2 The elastic shear buckling stress of longitudinally stiffened panels between primary members may be taken as:

$$\tau_e = K_s E \left(\frac{t}{s} \right)^2 \text{ for } A_R \geq 1$$

where

$$K_s = 4,5 \left(\left(\frac{s}{1000l} \right)^2 + \frac{1}{N^2} + \left(\frac{N^2 - 1}{N^2} \right) \left(\frac{\omega}{1 + \omega} \right)^r \right)$$

N = number of subpanels

$$= \frac{1000S_p}{s}$$

$$\omega = \frac{10I_{se}}{l t^3}$$

I_{se} = moment of inertia of a section, in cm^4 , consisting of the longitudinal stiffener and a plate flange of effective width $s/2$

$$r = 1 - 0,75 \left(\frac{s}{1000l} \right)$$

s, l, E and S_p are as defined in 3.2.1, see also Fig. 2.3.1.

3.6.3 The critical shear buckling stress, τ_c , may be determined from τ_e , see Note in Table 2.3.1.

Fig. 2.3.1
Longitudinally stiffened panels between primary members

3.7 Secondary stiffening in direction of compression

3.7.1 The buckling performance of stiffeners will be considered satisfactory if the following conditions are satisfied:

$$\frac{\sigma_d}{\sigma_{c(a)}} \leq \frac{1}{\lambda_\sigma} \quad \frac{\sigma_d}{\sigma_{c(t)}} \leq \frac{1}{\lambda_\sigma}$$

$$\frac{\sigma_d}{\sigma_{c(w)}} \leq \frac{1}{\lambda_\sigma} \quad \frac{\sigma_d}{\sigma_{c(f)}} \leq \frac{1}{\lambda_\sigma}$$

where

$\sigma_{c(a)}$, $\sigma_{c(t)}$, $\sigma_{c(w)}$ and $\sigma_{c(f)}$ are the critical buckling stress of the stiffener for each mode of failure, see 3.7.2

σ_d is the design compressive stress, see also 3.1.3 and 3.5
 λ_σ is the buckling factor of safety given in Table 5.3.2 in Chapter 5. The value of λ_σ to be chosen depends on the buckling assessment of the attached plating, see Note 3, Table 5.3.2.

3.7.2 The critical buckling stresses for the overall, torsional, web and flange buckling modes of longitudinals and secondary stiffening members under axial compressive loads are to be determined in accordance with Table 2.3.3.

3.7.3 To prevent torsional buckling of secondary stiffeners from occurring before buckling of the plating, the critical torsional buckling stress, $\sigma_{c(t)}$, is to be greater than the critical buckling stress of the attached plating as detailed in 3.4.1.

3.7.4 The critical buckling stresses of the stiffener web, $\sigma_{c(w)}$, and flange, $\sigma_{c(f)}$, are to be greater than the critical torsional buckling stress, hence:

$$\sigma_{c(w)} > \sigma_{c(t)}$$

$$\sigma_{c(f)} > \sigma_{c(t)}$$

3.7.5 To ensure that overall buckling of the stiffened panel cannot occur before local buckling of the secondary stiffener, the critical overall buckling stress $\sigma_{c(a)}$, is to be greater than the critical torsional buckling stress, hence:

$$\sigma_{c(a)} > \sigma_{c(t)}$$

3.8 Secondary stiffening perpendicular to direction of compression

3.8.1 Where a stiffened panel of plating is subjected to a compressive load perpendicular to the direction of the stiffeners, see Fig. 2.3.2, e.g. a transversely stiffened panel subject to longitudinal compressive load, the requirements of this Section are to be applied.

Fig. 2.3.2
Secondary stiffening perpendicular to direction compression

3.8.2 The minimum moment of inertia of each stiffener including attached effective plating of width, b_{eb} , to ensure that overall panel buckling does not precede plate buckling is to be taken as:

$$I_s = \frac{D s (4N_L^2 - 1)((N_L^2 - 1)^2 - 2(N_L^2 - 1)\kappa + \kappa^2)}{2(5N_L^2 + 1 - \kappa)\Pi^4 E} \text{ mm}^4$$

where

$$D = \frac{E t_p^3}{12(1 - \nu^2)}$$

$$\kappa = A_R^2 \Pi^2$$

A_R = plate panel aspect ratio

$$= \frac{s}{1000l}$$

$$\Pi = \frac{S}{l}$$

N_L = number of plate panels

$N_L - 1$ = number of stiffeners

$\nu = 0,3$

s , I and S are defined in 3.2.1 and shown in Fig. 2.3.2
 t_p and E are defined in 1.3.1.

3.9 Buckling of primary members

3.9.1 Where primary girders are subject to axial compressive loading, the buckling requirements for lateral, torsional, web and flange buckling modes detailed in 3.7 are to be satisfied.

3.9.2 To prevent global buckling from occurring before local panel buckling, transverse primary girders supporting axially loaded longitudinal stiffeners are to have a sectional moment of inertia, including attached plating, of not less than the following:

$$I_g = \frac{0,35 S_p^4 I_s}{l^3 s} \times 10^3 \text{ cm}^4$$

S_p and s are as defined in 3.2.1

I_g is the sectional moment of inertia including attached plating

I_s = moment of inertia of secondary stiffeners, in cm^4 , required to satisfy the elastic column buckling mode specified in Table 2.3.3

$$= \frac{\sigma_{ep} A_{te} l_e^2}{0,001 E}$$

where

$$\sigma_{ep} = 1,2\sigma_d \text{ N/mm}^2 \text{ for } \sigma_{e(a)} < \frac{\sigma_o}{2}$$

$$= \frac{\sigma_o^2}{4 (\sigma_o - 1,2\sigma_d)} \text{ for } \sigma_{e(a)} \geq \frac{\sigma_o}{2}$$

σ_d is design stress, in N/mm^2

σ_o and A_{te} are as defined in 3.2.1

$\sigma_{e(a)}$ is the elastic column buckling stress, see 3.7.2

E is defined in 1.3.1

l_e is defined in Table 2.3.3.

3.10 Shear buckling of girder webs

3.10.1 Local panels in girder webs subject to in-plane shear loads are to satisfy the shear buckling requirements in Table 2.3.2, item (b).

3.10.2 The critical shear buckling stress, τ_c , is to be determined using the following formula for τ_e and the Note in Table 2.3.1.

$$\tau_e = 3,62 \left(1,335 + \left(\frac{d_w}{1000 l_p} \right)^2 \right) E \left(\frac{t_p}{d_w} \right)^2 \text{ N/mm}^2$$

where

d_w = web height, in mm

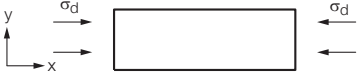

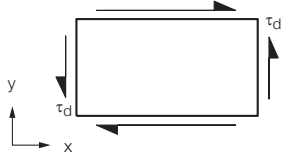

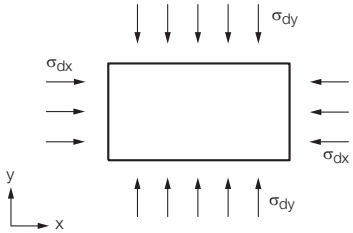

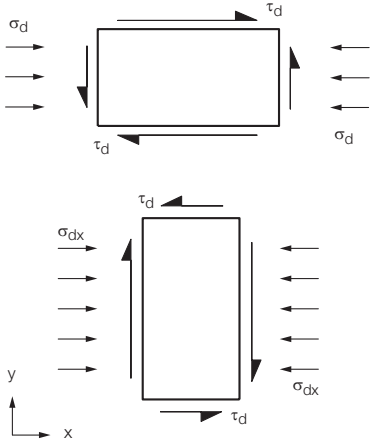

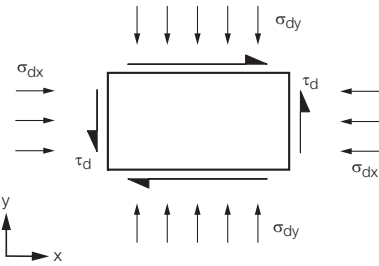

l_p = unsupported length of web, in metres

t_p and E are defined in 1.3.1.

3.11 Pillars and pillar bulkheads

3.11.1 Pillars and pillar bulkheads are to comply with the requirements of Ch 3,12.

Table 2.3.2 Plate panel buckling requirements

	Stress field	Buckling Interaction formula	
(a)	uni-axial compressive loads	$\frac{\sigma_d}{\sigma_c} \leq 1,0 \frac{1}{\lambda_\sigma}$	
(b)	shear loads	$\frac{\tau_d}{\tau_c} \leq \frac{1}{\lambda_\tau}$	
(c)	bi-axial compressive loads	for $A_R = 1,0$ $\frac{\sigma_{dx}}{\sigma_{cx}} + \frac{\sigma_{dy}}{\sigma_{cy}} \leq 1,0$ for other aspect ratios, i.e. $A_R \neq 1,0$ $\frac{\sigma_{dx}}{\sigma_{cx}} + \frac{\sigma_{dy}}{\sigma_{cy}} \leq G$ when G is taken from Fig. 2.3.3	
(d)	uni-axial compressive loads plus shear load	for $A_R > 1$ $\left(\frac{\sigma_d}{\sigma_c}\right) + \left(\frac{\tau_d}{\tau_c}\right)^2 \leq 1$ for $A_R \leq 1$ $\left(\frac{1 + 0,6A_R}{1,6}\right) \left(\frac{\sigma_d}{\sigma_c}\right) + \left(\frac{\tau_d}{\tau_c}\right)^2 \leq 1$	
(e)	bi-axial compressive loads plus shear loads	$\frac{0,625 \left(1 + \frac{0,6}{A_R}\right) \left(\frac{\sigma_{dy}}{\sigma_{cy}}\right) + \left(\frac{\tau_d}{\tau_c}\right)^2}{\left(1 - 0,625\right) \left(\frac{\sigma_{dx}}{\sigma_{cx}}\right) + 1 - \left(\frac{\sigma_{dx}}{\sigma_{cx}}\right)} \leq 1$	
Symbols			
σ_d = design compressive stress, see 3.1.3 σ_c = critical compressive buckling stress, in N/mm ² , for uniaxial compressive load acting independently, see 3.3.5 σ_{dx} = design compressive stress in x direction σ_{dy} = design compressive stress in the y direction σ_{cx} = critical compressive buckling stress in x direction, see 3.3.5 σ_{cy} = critical compressive buckling stress in y direction, see 3.3.5 λ_σ = buckling factor of safety for compressive stresses, see 3.3.4 λ_τ = buckling factor of safety for shear stresses, see 3.3.4 τ_d = design shear stress, in N/mm ² τ_c = critical shear buckling stress, in N/mm ² , acting independently, see 3.3.5			

Fig. 2.3.3
Interaction limiting stress curves of G for plate panels subject to bi-axial compression, see Table 2.3.2(c)

Table 2.3.3 Buckling stress of secondary stiffeners (see continuation)

Mode	Elastic buckling stress, N/mm ²	Critical buckling stress, N/mm ² see Note
(a) Overall buckling (perpendicular to plane of plating without rotation of cross-section)	$\sigma_{e(a)} = C_f 0,001 E \frac{I_a}{A_{te} l_e^2}$	$\sigma_{c(a)}$
(b) Torsional buckling	$\sigma_{e(t)} = \frac{0,001 E I_w}{I_p l_e^2} \left(m^2 + \frac{K}{m^2} \right) + 0,385 E \frac{I_t}{I_p}$	$\sigma_{c(t)}$
(c) Web buckling (excluding flat bar stiffeners)	$\sigma_{e(w)} = 3,8 E \left(\frac{t_w}{d_w} \right)^2$	$\sigma_{c(w)}$
(d) Flange buckling	$\sigma_{e(f)} = 3,8 E \left(\frac{t_f}{b_f} \right)^2$	$\sigma_{c(f)}$
<p>NOTE</p> <p>The critical buckling stresses are to be derived from the elastic buckling stresses as follows:</p> $\sigma_c = \sigma_e \text{ when } \sigma_e < \frac{\sigma_o}{2}$ $= \sigma_o \left(1 - \frac{\sigma_o}{4\sigma_e} \right) \text{ when } \sigma_e \geq \frac{\sigma_o}{2}$		
Symbols		
<p>d_w = web depth, in mm, (excluding flange thickness for rolled sections), see Fig. 2.2.1</p> <p>t_w = web thickness, in mm</p> <p>b_f = flange width, in mm (including web thickness)</p> <p>t_f = flange thickness, in mm. For bulb plates, the mean thickness of the bulb may be used, see Fig. 2.2.1</p> <p>l_e = effective span length of stiffener, in metres</p> <p>C_f = end constraint factor</p> <p>= 1 where both ends are pinned</p> <p>= 2 where one end is pinned and the other end fixed</p> <p>= 4 where both ends are fixed</p> <p>E = Youngs Modulus of elasticity of the material, in N/mm²</p> <p>I_a = moment of inertia, in cm⁴, of longitudinal, including attached plating of effective width b_{eb}. Table 2.3.3 Buckling stress of secondary stiffeners (conclusion)

I_t = St.Venant's moment of inertia, in cm^4 , of longitudinal (without attached plating)

$$= \frac{d_w^3 t_w^3}{3} 10^{-4} \text{ for flat bars}$$

$$= \frac{1}{3} \left[d_w^3 t_w^3 + b_f t_f^3 \left(1 - \frac{0,63 t_f}{b_f} \right) \right] 10^{-4} \text{ for built up profiles, rolled angles and bulb plates}$$

I_p = polar moment of inertia, in cm^4 , of profile about connection of stiffener to plating

$$= \frac{d_w^3 t_w^3}{3} 10^{-4} \text{ for flat bars}$$

$$= \left(\frac{d_w^3 t_w^3}{3} + d_w^2 b_f t_f \right) 10^{-4} \text{ for built up profiles, rolled angles and bulb plates}$$

I_w = sectorial moment of inertia, in cm^6 , of profile and connection of stiffener to plating

$$= \frac{d_w^3 t_w^3}{36} 10^{-6} \text{ for flat bars}$$

$$= \frac{t_f b_f^3 d_w^2}{12} 10^{-6} \text{ for 'Tee' profiles}$$

$$= \frac{b_f^3 d_w^2}{12 (b_f + d_w)^2} (t_f (b_f^2 + 2b_f d_w + 4d_w^2) + 3t_w b_f d_w) 10^{-6} \text{ for 'L' profiles, rolled angles and bulb plates}$$

C = spring stiffness exerted by supporting plate panel

$$= \frac{k_p E t_p^3}{3b \left(1 + \frac{1,33 k_p d_w t_p^3}{b t_w^3} \right)}$$

k_p = $1 - \eta_p$, and is not to be taken as less than zero. For built up profiles, rolled angles and bulb plates, k_p need not be taken less than 0,1

$$\eta_p = \frac{\sigma_d}{\sigma_{ep}}$$

σ_{ep} = elastic critical buckling stress, in N/mm^2 , of the supporting plate derived from Table 2.4.1

m is determined as follows; e.g. $m = 2$ for $K = 25$

K range	$0 \leq K < 4$	$4 \leq K < 36$	$36 \leq K < 144$	$144 \leq K < 400$	$400 \leq K < 900$	$900 \leq K < 1764$	$(m-1)^2 m^2 \leq K < m^2 (m+1)^2$
m	1	2	3	4	5	6	m

$$K = \frac{1,03 C S^4}{E I_w} 10^4$$

σ_d is the design stress, in N/mm^2

all other symbols are as defined in 3.2.1 or 1.3.1.

Section 4 Vibration control

4.1 General

4.1.1 Natural frequencies are to be investigated for local unstiffened and stiffened panels expected to be exposed to excessive structural vibrations being induced from machinery, propulsion unit or other potential excitation sources.

4.1.2 Where the structural configurations are such that basic structural elements may be modelled individually the natural frequencies may be derived in accordance with 4.3, 4.4 and 4.5, as appropriate. Under other circumstances, finite element analysis is to be employed to evaluate the vibration characteristics of the structure considered.

4.2 Frequency band

4.2.1 The natural frequency of panels is generally not to lie within a band of ± 20 per cent of a significant excitation frequency.

4.3 Natural frequency of plate

4.3.1 The natural frequency of an homogeneous clamped plate in air is given by the following:

$$f_{\text{air}} = 5537 \frac{t_p}{ls} \sqrt{\left(\frac{1000l}{s}\right)^2 + \left(\frac{s}{1000l}\right)^2 + 0,6045} \text{ Hz}$$

where

- l = panel length, in metres
- s = panel breadth, in mm
- t_p = panel thickness, in mm.

4.4 Natural frequency of plate and stiffener combination

4.4.1 The natural frequency of a plate stiffener of constant cross section in air is given by the following:

$$f_{\text{air}} = \frac{k_i}{20\pi l_b^2} \sqrt{\frac{EI}{m \left(1 + \frac{\pi^2 EI}{10^4 l_b^2 GA}\right)}} \text{ Hz}$$

where

- l_b = length of stiffener, in metres
- m = mass per unit length of the stiffener and associated plating, in kg/m
- K_i = constant where i refers to the mode of vibration as given in Table 2.4.1
- G = shear modulus of elasticity, in N/mm²
- A = shear area of stiffener, in cm²
- I = inertia of stiffener, in cm⁴
- E = modulus of elasticity, in N/mm².

Table 2.4.1 First mode of vibration constant K_i

End condition	Mode				
	1	2	3	4	5
Simply supported	9,92	—	—	—	—
Fixed ends	22,40	61,70	121,0	200,0	299,0
Simple and fixed	15,4	—	—	—	—

4.5 Effect of submergence

4.5.1 To obtain the frequency, f_{water} , of a plate with one side exposed to air and the other side exposed to a liquid, the frequency calculated in air, f_{air} , may be modified by the following formula:

$$f_{\text{water}} = f_{\text{air}} \sqrt{\frac{\kappa_p}{\kappa_p + \frac{\rho_l}{\rho_p}}}$$

where

- ρ_l = density of the liquid, in kg/m³
- ρ_p = density of the plate, in kg/m³

$$\kappa_p = \frac{\pi t_p}{ls} \sqrt{\frac{s^2}{10^6} + l^2}$$

where

l , s and t_p are as defined in 4.3.1.

Section 5 Dynamic loading

5.1 General

5.1.1 The following formulae are to be used to determine the dynamic response of plate and plate stiffener combinations. The natural frequency of structural items can be determined from Section 4 and the period T may then be determined as follows:

$$T = \frac{1}{f} \text{ seconds}$$

where

f = the natural frequency and is normally to be taken as f_{air} , see 4.3.1 for plating or 4.4.1 for plate and stiffener combination.

5.1.2 For bottom impact pressure loads and bow flare and above waterline impact pressure loads required by Ch 3,14 and 15 respectively, the impact pressure is assumed to be represented by a triangular pulse load. The rise time, t_1 , for these impact pressures is given in Pt 5, Ch 3,4.2.2 for bottom impact and Pt 5, Ch 3,4.3.2 for bow flare impact.

5.2 Gradually applied load

5.2.1 For a gradually applied load as shown in Fig. 2.5.1 the maximum dynamic load factor f_{DLF} can be calculated as from Table 2.5.1. Linear interpolation may be performed to obtain f_{DLF} values for intermediate t_1/T values.

Fig. 2.5.1 Gradually applied load

5.2.2 The time to maximum response can be calculated from Table 2.5.1 with intermediate values determined by linear interpolation.

5.3 Instantaneous load

5.3.1 For an instantaneous applied load as shown in Fig. 2.5.2 the maximum dynamic load factor f_{DLF} can be calculated as from Table 2.5.1. Linear interpolation may be performed to obtain f_{DLF} values for intermediate t_1/T values. The t_1 time value is given in the same section that the impulsive pressure load is specified.

5.3.2 The time to maximum response can be calculated from Table 2.5.1 with intermediate values determined by linear interpolation.

5.4 Triangular pulse load

5.4.1 For a triangular pulse load as shown in Fig. 2.5.3, the maximum dynamic load factor DLF can be calculated from Table 2.5.1. Linear interpolation may be performed to obtain DLF values for intermediate t_1/T values. The t_1 time value is given in the same section that the impulsive pressure load is specified.

5.4.2 The time to maximum response can be calculated from Table 2.5.1 with intermediate values determined by linear interpolation.

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter are applicable to monohull craft of steel construction as defined in Pt 1, Ch 2.2.

1.1.2 All NS1, NS2 and NS3 ships as defined in Part 1 are to comply with the minimum requirements of Section 2 and general structural requirements of Sections 5 to 15.

1.1.3 The basic structural scantlings of NS1 ships are to be determined in accordance with Section 3 and supported where necessary by direct calculations.

1.1.4 The basic structural scantlings of NS2 and NS3 ships are to be determined in accordance with Section 4 and supported by direct calculations where necessary.

1.2 General

1.2.1 The formulae used in this Chapter are to be used in conjunction with the design loadings from Part 5 and design tools in Chapter 2 to determine the rule scantling requirements.

1.2.2 All references to longitudinal locations in the Rules are to be taken as forward of the aft end of L_R unless otherwise stated, e.g. $0,75L_R$ is 75 per cent of L_R forward of the aft end of L_R

where

L_R is defined in Pt 3, Ch 1,5.2.

1.3 Direct calculations

1.3.1 The extent of direct calculation required will depend on the ship structural configuration and operational requirements and is to be agreed between the designer, Owner and Lloyd's Register (hereinafter referred to as 'LR') at an early stage in the plan approval process.

1.3.2 In addition, where the ship is of unusual design, form, proportion or has operational requirements such as very high speed, the scantlings will be specially considered and may require direct calculation.

1.4 Equivalents

1.4.1 LR will consider direct calculations for the derivation of scantlings as an alternative and equivalent to those derived by rule requirements in accordance with Pt 3, Ch 1,2 and 3.

■ Section 2 Minimum structural requirements

2.1 General

2.1.1 The requirements of this Section, unless specified otherwise, are applicable to all ship types, NS1, NS2 and NS3.

2.1.2 The scantlings of plating and stiffeners determined from the Rule scantling requirements are not to be less than that given in Table 3.2.1 for the ship type. Due consideration is to be given to the vessel type correction factor, ω , as defined in Table 3.2.2.

2.1.3 In addition, where plating contributes to the global strength of the ship, the thickness is to be not less than that required to satisfy the global strength requirements detailed in Chapter 4.

2.2 Corrosion margin

2.2.1 The minimum thicknesses given in Table 3.2.1 are based on the assumption that there is negligible loss in strength by corrosion. Where this is not the case the minimum thickness will be specially considered. Requirements for corrosion margin are given in Pt 6, Ch 6,2.10.

Scantling Determination

Volume 1, Part 6, Chapter 3

Section 2

Table 3.2.1 Minimum structural requirements (see continuation)

Item	Minimum scantling		
Shell envelope			
Bottom shell and bilge plating	$\sqrt{k_{ms}} (0,4 \sqrt{L_R} + 2)$ mm	$\geq 5,0\omega$	
Side shell plating	$\sqrt{k_{ms}} (0,38 \sqrt{L_R} + 1,2)$ mm	$\geq 4,0\omega$	
Breadth of keel plate, if fitted	$7L_R + 340$ mm	≥ 750	See Note 1
Keel plate thickness, if fitted	$\omega \sqrt{k_{ms}} 1,35L_1^{0,45}$ mm		See Note 2
Breadth of stem plate	$7L_R + 340$ mm	≥ 600	See Note 2
Stem plate thickness	$\omega (5 + 0,083L_2) \sqrt{k_{ms}}$ mm		
Bar keel area, if fitted	$\omega k_{ms} L_R^{1,1}$ cm ²		
Bar keel thickness, if fitted	$\omega \sqrt{k_{ms}} (0,6L_R + 6)$ mm		See Note 2
Single bottom structure			
Centre girder web thickness	$\sqrt{k_{ms}} (\sqrt{L_R} + 1)$ mm	$\geq 4,0\omega$	
Side girder web thickness	$\sqrt{(k_{ms} L_R)}$ mm	$\geq 3,5\omega$	
Floor web thickness	$\omega \sqrt{k_{ms}} (0,03L_R + 3,5)$ mm	$\geq 3,5\omega$	
Centreline girder face flat area	$\omega 0,5 L_R k_{ms}$ cm ²		
Floor face flat area	$4,5 T k_{ms} \left(1 - \frac{2,5}{B}\right)$ cm ²		See Note 3
Depth of floors, d_f	$35 (1,6B + T) - 75$ mm		
Double bottom structure			
Inner bottom plating thickness	$\sqrt{k_{ms}} (0,4 \sqrt{L_R} + 1,5)$ mm	$\geq 4,0\omega$	
Centreline girder web thickness	$\sqrt{k_{ms}} (0,9 \sqrt{L_R} + 1)$ mm	$\geq 4,0\omega$	
Side girder web thickness	$\sqrt{k_{ms}} 0,72 \sqrt{L_R}$ mm	$\geq 3,5\omega$	
Floor web thickness	$\sqrt{k_{ms}} (0,03L_R + 3,5)$ mm	$\geq 3,5\omega$	
Depth of double bottom, d_{DB}	$28B + 205 \sqrt{T}$ mm	≥ 630	
Watertight bulkheads			
Plating thickness	$\omega \sqrt{k_{ms}} (0,33 \sqrt{L_R} + 1,0)$ mm	$\geq 3,5\omega$	
Deep tank bulkheads			
Plating thickness	$\omega \sqrt{k_{ms}} (0,38 \sqrt{L_R} + 1,2)$ mm	$\geq 4,0\omega$	
Deck structure			
Strength deck	$\omega \sqrt{k_{ms}} (0,38 \sqrt{L_R} + 1,2)$ mm	$\geq 4,0\omega$	
Internal and lower decks	$\omega \sqrt{k_{ms}} (0,18 \sqrt{L_R} + 1,7)$ mm	$\geq 3,0\omega$	
Exposed deck plating thickness, fwd of $0,75L_R$	$\omega \sqrt{k_{ms}} (0,015L_R + 5,5)$ mm	$\geq 5,0\omega$	
Exposed deck plating thickness, aft of $0,75L_R$	$\omega \sqrt{k_{ms}} (0,38 \sqrt{L_R} + 1,2)$ mm	$\geq 4,0\omega$	

Scantling Determination

Volume 1, Part 6, Chapter 3

Section 2

Table 3.2.1 Minimum structural requirements (conclusion)

Item	Minimum scantling	
Superstructure and deckhouses		
Deck plating thickness	$\omega \sqrt{k_{ms}} (0,18 \sqrt{L_R} + 1,7) \text{ mm}$	$\geq 3,0\omega$
Side plating thickness	$\omega \sqrt{k_{ms}} (0,3 \sqrt{L_R} + 1) \text{ mm}$	$\geq 3,0\omega$
Front plating thickness, fwd of $0,75L_R$	$\omega \sqrt{k_{ms}} (0,3 \sqrt{L_R} + 2) \text{ mm}$	$\geq 5,0\omega$
Front plating thickness, aft of $0,75L_R$	$\omega \sqrt{k_{ms}} (0,25 \sqrt{L_R} + 2) \text{ mm}$	$\geq 4,0\omega$
Back plating thickness	$\omega \sqrt{k_{ms}} (0,25 \sqrt{L_R} + 2) \text{ mm}$	$\geq 3,0\omega$
Machinery casing plating thickness	$\omega \sqrt{k_{ms}} (0,25 \sqrt{L_R} + 2) \text{ mm}$	$\geq 3,0\omega$
Pillars		
Wall thickness of tubular pillars	$\omega \sqrt{k_{ms}} 0,05d_p \text{ mm}$	$\geq 2,5\omega$
Wall thickness of rectangular pillars	$\omega \sqrt{k_{ms}} 0,05b_p \text{ mm}$	$\geq 2,5\omega$
Plated mast structures which are not structurally effective		
Deck, side and back plating	3 mm	
Front plating thickness, fwd of $0,75L_R$	5 mm	
Front plating thickness, aft of $0,75L_R$	4 mm	
Symbols		
L_1 = L_R but need not be taken greater than 190 m	σ_u = specified minimum ultimate tensile strength of the material, in N/mm ²	
L_2 = L_R but need not be taken greater than 215 m	b_p = minimum breadth of cross section of hollow rectangle pillar, in mm	
ω = vessel type correction factor as determined from Table 3.2.2	d_p = outside diameter of tubular pillar, in mm	
k_{ms} = $635/(\sigma_o + \sigma_u)$	L_R, B and T are defined in Pt 3, Ch 1,5.2	
σ_o = specified minimum yield strength of the material, in N/mm ²		
NOTES		
1. Maximum keel breadth 1800 mm.		
2. Not to be less than adjacent shell plate. Above the design waterline the bar keel may be the same as the adjacent shell.		
3. Face plate thickness not to be less than floor thickness.		

Table 3.2.2 Vessel type correction factor (ω)

Vessel type	ω
Bottom structure of ships operating aground	1,2
NS1	1,1
NS2 and 3	1,0

2.3 Impact consideration

2.3.1 Due consideration is to be given to the scantlings of all structure which may be subject to local impact loadings. For example decks in workshops. Impact testing may be required to be carried out at the discretion of LR to demonstrate the suitability of the proposed scantlings for a particular application.

2.4 Sheathing

2.4.1 Areas of shell and deck which are subject to additional wear by abrasion from, i.e. removal or stores routes, working areas, forefoot region, etc., are to be suitably protected by local reinforcement or sheathing. This sheathing may be of timber, rubber, steel, additional layers of reinforcement, etc., as appropriate. Details of such sheathing and the method of attachment are to be submitted for consideration.

2.4.2 The attachment of sheathing by mechanical means such as bolting or other methods is not to impair the watertight integrity of the ship. Through bolting of the hull is to be kept to a minimum and avoided where practicable. The design arrangements in way of any through bolting are to be such that damage to the sheathing will not impair the watertight integrity of the hull.

Scantling Determination

Volume 1, Part 6, Chapter 3

Sections 2 & 3

2.4.3 When decks that are not structurally effective or subject to significant inplane stresses are fitted with approved sheathing, the thickness derived may be reduced by 10 per cent for a 50 mm sheathing thickness, or five per cent for 25 mm, with intermediate values in proportion. The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck. Inside deckhouses the thickness may be reduced by a further 10 per cent.

2.5 Special considerations

2.5.1 Flight decks and structures in way of launcher ramps, gun platforms, etc., will be subject to special consideration.

2.5.2 The minimum plating thickness of ships intended for operation in ice conditions will be specially considered.

2.5.3 Ships with shock enhanced notation are not to be fitted with bar keels. Docking arrangements are to be specially considered.

2.5.4 For large or novel ships, the scantlings of the stem will be specially considered.

2.5.5 Where water jet or sterndrive units are fitted, the scantlings of the plating in way of the nozzles and connections will be specially considered.

2.6 Direct calculations

2.6.1 The thickness requirements derived from Table 3.2.1 may be specially considered, where direct calculation procedures are adopted to demonstrate the suitability of the proposed alternative, e.g. shear buckling analysis may be performed on girder or floor webs.

Section 3 NS1 scantling determination

3.1 General

3.1.1 The scantlings for NS1 ships may be determined from the global and local requirements defined in this Section. In addition the general requirements of Sections 5 to 15 are to be complied with.

3.1.2 The scantlings given in this Section are based on the assumption that there is negligible loss in strength by corrosion.

3.1.3 The corrosion margins specified in Ch 6,2.10 are to be applied to the derived scantlings as appropriate, see also Ch 1,2.2.1.

3.2 Symbols

3.2.1 The symbols used in this Section are defined as follows:

F_B = local scantling reduction factor for hull members below the neutral axis, see 3.6

F_D = local scantling reduction factor for hull members above the neutral axis, see 3.6

I_{min} = minimum moment of inertia, of the hull midship section about the transverse neutral axis, in m^4

Z_D, Z_B = actual hull section moduli, in m^3 , at strength deck and keel respectively, see Ch 4,2

Z_{min} = minimum hull midship section modulus about the transverse neutral axis, in m^3

σ_p = permissible combined stress (still water plus wave), in N/mm^2 , see Ch 4,2

σ_o = yield strength of material in N/mm^2

σ_D, σ_B = maximum hull vertical bending stress at strength deck and keel respectively, in N/mm^2 determined from Ch 4,2

k_L = longitudinal high strength steel factor, see Ch 5,2.1.2

k_s = the local high strength steel factor, see Ch 5,2.1.1

L_1 = L_R but need not be taken greater than 190 m

L_2 = L_R but need not be greater than 215 m

s = spacing of secondary stiffeners, in mm

S = spacing of primary members, in metres

ρ = relative density (specific gravity) of a liquid carried in a tank not to be taken less than 1,025

$$f = \frac{1}{1 + \left(\frac{s}{1000S}\right)^2} \text{ transverse framing aspect ratio correction}$$

L_R is as defined in Pt 3, Ch 1,5.2.

3.3 Hull girder strength

3.3.1 For all ships, the hull girder strength requirements of Ch 4,2 are to be complied with.

3.3.2 As required by Ch 4,2, the hull girder bending and shear stresses for all longitudinally effective material is to be verified against the permissible stresses and the buckling requirements of Ch 2,3. In addition, the lateral and torsional stability of all effective longitudinals together with the web and flange buckling criteria are to be verified in accordance with Ch 2,3.

3.3.3 In addition, the minimum requirements of 3.4 and 3.5 are to be satisfied.

3.4 Minimum hull section modulus

3.4.1 The hull midship section modulus about the transverse neutral axis, at the deck or the keel, is to be not less than:

$$Z_{min} = 0,95k_L M_o \times 10^{-5} \text{ m}^3$$

where

M_o is given in Pt 5, Ch 4,3.3.1

k_L is as defined in 3.2.1.

Scantling Determination

Volume 1, Part 6, Chapter 3

Section 3

3.5 Minimum hull moment of inertia

3.5.1 The hull midship section moment of inertia about the transverse neutral axis is to be not less than the following using the maximum total bending moment, sagging or hogging:

$$I_{\min} = 3,0L_R M_R / 175 \times 10^{-5} \text{ m}^4$$

where

M_R = design bending moment, sagging (negative) and hogging (positive), in kN m, to be taken negative or positive according to the convention given in Pt 5, Ch 4,3.10.

3.6 Local reduction factors

3.6.1 Where the maximum hull vertical bending stress at deck or keel is less than the permissible combined stress, σ_p , reductions in local scantlings within $0,3L_R$ to $0,7L_R$ may be permitted. The reduction factors are defined as follows:

For hull members above the neutral axis

$$F_D = \sigma_D / \sigma_p$$

For hull members below the neutral axis

$$F_B = \sigma_B / \sigma_p$$

In general the values of σ_D and σ_B to be used are the greater of the sagging or hogging stresses, and F_D and F_B are not to be taken less than 0,67 for plating and 0,75 for longitudinal stiffeners. σ_B , σ_D and σ_p are defined in 3.2.1.

3.6.2 Where higher tensile steel is used in the hull structure, the values of F_D and F_B for the mild steel part are to be taken as not less than z/z_M

where

z = vertical distance from the hull transverse neutral axis to the position considered, in metres

z_M = vertical distance, in metres, from the hull transverse neutral axis to the minimum limit of higher tensile steel, above or below the neutral axis as appropriate.

3.7 Taper requirements for hull envelope

3.7.1 The scantlings determined at amidships are to be maintained between $0,3L_R$ and $0,7L_R$. Outside of this region and forward of $0,075L_R$ and aft of $0,925L_R$ the scantling requirements for the following structural items are to be determined by linear interpolation between the midship section and the forward or after ends as appropriate, see Fig. 3.3.1.

- Strength deck plating.
- Deck longitudinals.
- Shell envelope.

3.7.2 The taper requirement does not apply to ships where there are large openings in the decks such that the torsional rigidity of the hull is significantly reduced.

3.7.3 The thickness may need to be increased above the taper thickness by military features, special features or other requirements such as bottom slamming or bow flare impact.

3.7.4 The formulae for the taper values are based on the assumption that the yield values of steel is the same at amidships and ends. Where higher tensile steel is used in the midship region and mild steel at the ends, the taper values should be calculated for both yield values of steel. In way of the transition from higher tensile to mild steel, the thickness may be determined in accordance with Fig. 3.3.1. The aft end thickness is to be tapered in a similar manner.

3.7.5 Where the higher tensile steel longitudinals extend beyond the point of transition from higher tensile to mild steel plating, the modulus of the composite section is to be greater than the required mild steel value at the deck plate flange, and k_L times the mild steel value at the higher tensile flange.

3.8 Grouped stiffeners

3.8.1 Where stiffeners are arranged in groups of the same scantling, the section modulus requirement of each group is to be based on the greater of the following:

- the mean value of the section modulus required for individual stiffeners within the group;
- 90 per cent of the maximum section modulus required for individual stiffeners within the group.

3.9 Shell envelope plating

3.9.1 Shell envelope plating for both longitudinally and transversely framed ships is to comply with the requirements of Table 3.3.1.

3.9.2 The thickness of the shell envelope plating is in no case to be less than the appropriate minimum requirement given in Section 2.

Scantling Determination

Volume 1, Part 6, Chapter 3

Section 3

Table 3.3.1 Shell envelope plating (see continuation)

Location	Minimum thickness, in mm, see also 5.3.1	
	Longitudinal framing	Transverse framing
(1) Bottom plating and bilge where framed $0,3L_R$ to $0,7L_R$ (see Notes 3, 4 and 5)	<p>The greater of the following:</p> <p>(a) $t = 9,0s_1 (0,043L_1 + 10) \sqrt{\frac{F_B}{k_L}} \times 10^{-4}$</p> <p>(b) $t = 4,7s_1 \sqrt{\frac{h_{T2} k_s}{1,8 - F_B}} \times 10^{-3}$</p>	<p>The greater of the following:</p> <p>(a) $t = 0,001s_1 f (0,056L_1 + 16,7) \sqrt{\frac{F_B}{k_L}}$</p> <p>(see Note 4)</p> <p>(b) $t = 5,7s_1 \sqrt{\frac{h_{T2} k_s}{1,8 - F_B}} \times 10^{-3}$</p>
(2) Bottom plating and bilge fwd of $0,925L_R$ (see Note 2) aft of $0,075L_R$	$t = (6,0 + 0,03L_R) \sqrt{\frac{k_s s_1}{s_b}}$	
(3) Side shell clear of sheerstrake $0,3L_R$ to $0,7L_R$ (see Notes 1 and 5)	<p>(a) Above $\frac{D}{2}$ from base:</p> <p>The greater of the following:</p> <p>(i) $t = 9,0s_1 (0,059L_1 + 7) \sqrt{\frac{F_D}{k_L}} \times 10^{-4}$</p> <p>(ii) $t = 3,8s_1 \sqrt{h_{T1} k_s} \times 10^{-3}$</p>	<p>(a) Within $\frac{D}{4}$ from the gunwale:</p> <p>The greater of the following:</p> <p>(i) $t = 0,00085s_1 f (0,083L_1 + 10) \sqrt{\frac{F_D}{k_L}}$</p> <p>(ii) $t = 3,8s_1 \sqrt{h_{T1} k_s} \times 10^{-3}$</p>
	<p>(b) At upper turn of bilge:</p> <p>The greater of the following:</p> <p>(i) $t = 9,0s_1 (0,059L_1 + 7) \sqrt{\frac{F_B}{k_L}} \times 10^{-4}$</p> <p>(ii) $t = 4,9s_1 \sqrt{\frac{h_{T2} k_s}{2 - F_B}} \times 10^{-3}$</p>	<p>(b) Within $\frac{D}{4}$ from mid-depth:</p> <p>The greater of the following:</p> <p>(i) $t = 9,0s_1 (0,059L_1 + 7) \sqrt{\frac{F_M}{k_L}} \times 10^{-4}$</p> <p>(ii) $t = 4,6s_1 \sqrt{h_{T1} k_s} \times 10^{-3}$</p>
	<p>(c) Between upper turn of bilge and $\frac{D}{2}$ from base:</p> <p>The greater of the following:</p> <p>(i) t from (b)(i)</p> <p>(ii) t from interpolation between (a)(ii) and (b)(ii)</p>	<p>(c) Within $\frac{D}{4}$ from base (excluding bilge plating) see Note 1</p> <p>The greater of the following:</p> <p>(i) $t = 0,00085s_1 f (0,083L_1 + 10) \sqrt{\frac{F_B}{k_L}}$</p> <p>(ii) $t = 5,7s_1 \sqrt{\frac{h_{T2} k_s}{1,8 - F_B}} \times 10^{-3}$</p>
(4) Side shell fwd of $0,925L_R$ aft of $0,075L_R$	$t = (6,0 + 0,03L_R) \sqrt{\frac{k_s s_1}{s_b}}$	
(5) Sheerstrake	$0,00075s_1 \sqrt{L_R k_s} + 1,5$ <p>but not less than the thickness of the adjacent side plating.</p>	

3.9.3 Additional requirements for shell envelope plating are indicated in Section 5.

3.10 Shell envelope framing

3.10.1 Shell envelope framing for both longitudinally and transversely framed ships is to comply with the requirements of Tables 3.3.2 and 3.3.3.

Scantling Determination

Volume 1, Part 6, Chapter 3

Section 3

Table 3.3.1 Shell envelope plating (conclusion)

Symbols	
F_B, F_D are as defined in 3.6	$s_1 = s$, but is not to be taken less than s_b
L_R, D, T are as defined in Pt 3, Ch 1,5.2	$s_b = 600 \text{ mm}$ fwd of $0,95L_R$
$L_1, L_2, \rho, s, S, f, k_L, k_s$ are as defined in 3.2.1	$= 700 \text{ mm}$ $0,95L_R$ to $0,7L_R$
$C_{WL} =$ a wave head in metres $= 0,0771L_R e^{-0,0044L_R}$	$= 700 \text{ mm}$ $0,7L_R$ to $0,05L_R$
where $L_R > 227 \text{ m}$, C_{WL} is not to be taken less than $6,446 \text{ m}$	$= 600 \text{ mm}$ aft of $0,05L_R$
$h_{T1} = T + C_{WL}$, in metres but need not be taken greater than $1,367 \text{ m}$	$F_M =$ the greater of F_B and F_D
$h_{T2} = (T + 0,5C_{WL})$, in metres but need not be taken greater than $1,27 \text{ m}$	$e =$ base of natural logarithms, $2,7183$
NOTES	
1. Outside the vertical extent of higher tensile steel as defined in Ch 2,1.6.3 the value of k_L may be taken as 1,0.	
2. See also Sections 14 and 15 for requirements for bottom slamming and bow flare impact.	
3. For keel plate thickness and breadth, see Table 3.2.1.	
4. Unframed bilge plating will be specially considered.	
5. Shell envelope plating from $0,075L_R$ to $0,3L_R$ and $0,7L_R$ to $0,925L_R$ is to be determined by assuming a linear taper from the midship value given by (1) or (3) as appropriate to $t = (6,0 + 0,03L_R) \sqrt{k_s}$ at $0,075L_R$ and $0,925L_R$. The plating thickness determined is not to be less than the value given by (2) or (4) as appropriate. See also 3.7.	

3.10.2 Shell envelope primary structure for both longitudinally and transversely framed ships is to comply with the requirements of Table 3.3.4.

3.10.3 Additional requirements for shell envelope framing are indicated in Section 6.

3.11 Watertight bulkheads and deep tanks

3.11.1 Watertight bulkhead and deep tank scantlings are to comply with the requirements of Table 3.3.5. Factors for the stiffener end connection type are given in Fig. 3.3.3.

3.11.2 The thickness of the watertight bulkhead and deep tank plating is in no case to be less than the appropriate minimum requirements given in Section 2.

3.11.3 Additional requirements for watertight bulkhead and deep tank scantlings are indicated in Pt 3, Ch 2,4 and Pt 3, Ch 2,3 respectively.

3.12 Deck structures

3.12.1 Deck plating for both longitudinally and transversely framed ships is to comply with the requirements of Table 3.3.6.

3.12.2 Deck framing for both longitudinally and transversely framed ships is to comply with the requirements of Table 3.3.7 and for transversely framed ships Table 3.3.8.

3.12.3 Deck primary structure for both longitudinally and transversely framed ships is to comply with the following requirements:

(a) Girders and transverses or deep beams in way of dry spaces:

(a) supporting up to three point loads Z to be determined using calculations based on a stress of $123,5/k_s \text{ N/mm}^2$, assuming fixed ends and the inertia given as follows:

$$I = \frac{1,85}{k_s} l_e Z \text{ cm}^4$$

(b) supporting four or more point loads or a uniformly distributed load

$$Z = 4,75k_s S H_g l_e^2 \text{ cm}^3$$

$$I = \frac{1,85}{k_s} l_e Z \text{ cm}^4$$

(b) Girders and transverses in way of the crown or bottom of a tank

$$Z = 11,7k_s h_4 S l_e^2 \text{ cm}^3$$

$$I = \frac{2,8}{k_s} l_e Z \text{ cm}^4$$

where

$H_g =$ weather head h_1 , or deck pressure head h_2 , in metres as given in Table 3.3.7

$h_4 =$ tank head, in metres

$l_e =$ effective span length in metres as defined in Ch 2,2.6

S, k_s are as defined in 3.2.1.

3.12.4 The thickness of the deck plating is in no case to be less than the appropriate minimum requirements given in Section 2.

3.12.5 Additional requirements for deck structures are indicated in Section 10.

Scantling Determination

Volume 1, Part 6, Chapter 3

Section 3

Table 3.3.2 Shell envelope framing (0,2L_R to 0,8L_R)

Longitudinal framing	Modulus, in cm ³	
(1) Side longitudinals in way of dry spaces, including double skin construction (see Note 1)	The lesser of the following: (a) $Z = 0,05 s k_s h_{T1} l_e^2 F_s F_1$ (b) Z from (3)(a) evaluated using s and l_e for the longitudinal under consideration and the remaining parameters evaluated at the base line	
(2) Side longitudinals in way of wet spaces or deep tanks	The greater of the following: (a) Z as from (1) (b) As required by Table 3.3.5 for deep tanks, using h_{T3} instead of h_4 , but need not exceed Z from (3)(b) evaluated using l_{e1} , s and l_e for the longitudinal under consideration and the remaining parameters evaluated at the base line	
(3) Bottom and bilge longitudinals	The greater of the following: (a) $Z = (0,002l_{e1} + 0,042) s k_s h_{T2} l_e^2 F_s F_1$ (b) $Z = (0,002l_{e1} + 0,042) s k_s h_{T3} l_e^2 F_s F_1$	
Transverse framing	Modulus, in cm ³	Inertia, in cm ⁴
(4) Side frames in dry spaces	The greater of the following: (a) $Z = C s k_s h_{T1} H^2 \times 10^{-3}$ (b) $Z = 8,2 s k_s D_1 \times 10^{-3}$	$I = \frac{3,2}{k_s} H Z$
(5) Side frames in way of wet spaces or deep tanks	The greater of the following: (a) $1,15 \times Z$ from (4) (b) $Z = 6 s k_s h H^2 \times 10^{-3}$	$I = \frac{3,2}{k_s} H Z$
(6) Frames supporting hatch end beams or deck transverses (see Note 3)	The greater of the following: (a) Z from (4) (b) $Z = 2,2 (0,2l_s^2 + H^2) k_s S H_9$	$I = \frac{3,2}{k_s} H Z$
(7) Bottom transverse frames (see Note 4)	$Z = 2 s k_s T l_e \times 10^{-2}$	—
Symbols		
<p>$\rho, L_1, L_2, s, k_s, S$ are as defined in 3.2.1 L_R, D, T are as defined in Pt 3, Ch 1,5.2 C_{WLIS} as defined in Table 3.3.1 F_B, F_D is as defined in 3.6 l_e = as defined in Ch 2,2.6, but is not to be taken less than 1,5 m except in way of the centre girder brackets required by 8.5.3 where a minimum span of 1,25 m may be used l_{e1} = l_e in metres, but is not to be taken less than 2,5 m and need not be taken greater than 5,0 m F_s is a fatigue factor for side longitudinals defined in Table 3.3.3</p> <div style="display: flex; align-items: center;"> <div style="margin-right: 20px;"> $C_1 = \frac{60}{225 - 165F_D} \text{ at deck}$ $= 1,0 \text{ at } \frac{D}{2}$ $= \frac{75}{225 - 150F_B} \text{ at base line}$ </div> <div style="font-size: 3em; margin-right: 20px;">}</div> <div>Intermediate values by interpolation</div> </div> <div style="display: flex; align-items: center; margin-top: 10px;"> <div style="margin-right: 20px;"> $F_1 = \frac{D C_1}{4D + 20h_5} \text{ for side longitudinals above } \frac{D}{2}$ $= \frac{D C_1}{25D - 20h_5} \text{ for side longitudinals below } \frac{D}{2}$ </div> <div style="font-size: 3em; margin-right: 20px;">}</div> <div>minimum $F_1 = 0,14$</div> </div> <p>and bottom longitudinals</p> <p>where</p> <div style="display: flex; justify-content: space-between;"> <div style="width: 45%;"> <p>z = height above base, in metres</p> <p>f_{cw} = 0,5 at base line</p> <div style="display: flex; align-items: center;"> <p>$= 1,0$ at T</p> <div style="font-size: 2em; margin: 0 10px;">}</div> <p>Intermediate values by interpolation</p> </div> <p>H_9 = weather head, h_1, or stores head, h_2, in metres, as defined in Table 3.3.7, whichever is applicable</p> </div> <div style="width: 45%;"> <p>D_1 = 1,6T but not less than 10 or greater than 16 (see Note 1)</p> <p>H = vertical framing depth in m, but not less than 2,5 m, see Note 2</p> <p>h_{T1} = $(T - z + f_{cw} C_{WL}) F_\lambda$ below T $= f_{cw} C_{WL} F_\lambda$ above T but not less than the greater of $F_\lambda L_1/70$ or 1,2 m</p> <p>h_{T2} = $(T + 0,5C_{WL}) F_\lambda$</p> <p>$h_{T1}$ and h_{T2} need not exceed $(1,6T - z + D_1/8)$ below 1,6T and $(z - 1,6T + D_1/8)$ above 1,6T</p> <p>h_{T3} = $0,9h_4 - 0,25T$, in metres, at the base line $= 0,9h_4$, in metres, at and above $T/4$ from the base line, intermediate values by linear interpolation</p> <p>h_4 = load head required by Table 3.3.5 for deep tanks</p> <p>h_5 = measured from the mid length of the stiffener to the strength deck at side</p> <p>h = h_4 or h_5 whichever is greater</p> <p>F_λ = 1,0 for $L_R \leq 200$ m $= [1,0 + 0,0023(L_R - 200)]$ for $L_R > 200$ m</p> <p>C = end connection factor $= 3,1$ where two Rule standard brackets are fitted $= 3,1 (1,8 - 0,8l_a/l_b)$ where one Rule standard bracket and one reduced bracket fitted $= 3,1 (2,15 - 1,15l_{am}/l_b)$ where two reduced brackets are fitted $= 5,5$ where one Rule standard bracket is fitted $= 5,5 (1,2 - 0,2l_a/l_b)$ where one reduced bracket is fitted $= 6,4$ where no bracket is fitted</p> <p>The requirements for frames where brackets larger than Rule standard are fitted will be specially considered</p> <p>l_a = equivalent arm length, in mm, as derived from Ch 6,5.4.5</p> <p>l_b = as defined in Ch 6,5.4.5</p> <p>l_{am} = mean equivalent arm length, in mm, for both brackets</p> <p>l_s = span of supported beam or transverse in metres</p> </div> </div>		
<p>NOTES</p> <ol style="list-style-type: none"> The scantlings of members above $D/2$ may require special consideration on the basis of structural configuration and the distribution of bending stress at the section concerned. Where frames are inclined at more than 15° to the vertical, H, is to be measured along a chord between span points of the frame. If the modulus obtained from (6) for frames under deck transverses exceeds that obtained from (4) and (5), the intermediate frames may be reduced provided that the combined modulus is maintained and the reduction in any intermediate frame is not greater than 35 per cent. The reduced modulus is to be not less than that given by (4)(b). For single bottom structure a plate floor is to be fitted at every frame.

Table 3.3.3 Shell envelope framing forward and aft

Location		Modulus, in cm ³	
Longitudinal framing			
(1) Side longitudinals in way of dry spaces including double skin construction (see Note 3): (a) Forward of the collision bulkhead (b) Aft of the aft peak bulkhead (c) Between the collision bulkhead and 0,8L and between aft peak bulkhead and 0,2L		$Z = 0,0065s k_s h_{T1} l_e^2 F_s$ but not less than $Z = 0,007s k_s l_e^2 (0,6 + 0,167D_2)$ $Z = 0,008s k_s h_{T1} l_e^2 F_s$ but not less than $Z = 0,007s k_s l_e^2 (0,6 + 0,167D_2)$ $Z = 0,0065s k_s h_{T1} l_e^2 F_s$ or as required in the midship region whichever is the greater, but not less than $Z = 0,007s k_s l_e^2 (0,6 + 0,167D_2)$	
(2) Side longitudinals in way of double skin or deep tanks		As required in the midship region	
(3) Bottom and bilge longitudinals (see Note 4)		As required in the midship region	
Transverse framing		Inertia, in cm ⁴	
(4) Side frames fwd of collision bulkhead and aft of aft peak bulkhead		The greater of (a) $Z = 1,85s k_s T D_2 S_1 \times 10^{-3}$ (b) $Z = 0,007s k_s l_e^2 (0,6 + 0,167D_2)$	$I = f_1 S_1 Z/k_s$
(5) All other frames in dry spaces forward of 0,8L and aft 0,2L (see Note 2)		The greater of the following (a) $Z = C s k_s h_{T1} H^2 \times 10^{-3}$ (b) $Z = 8,2s k_s D_2 \times 10^{-3}$ (c) $Z = 0,007s k_s l_e^2 (0,6 + 0,167D_2)$	$I = f_1 S_1 Z/k_s$
(6) Panting stringer		Web depth, d_w , same depth as frames Web thickness, $t = 5 + 0,025L_2$ mm Face area, $A = k_s S_2 (H + 1)$ cm ²	
(7) Main and 'tween deck frames elsewhere		As required in the midship region	
Symbols			
L_1, L_2, s, k_s are as defined in 3.2.1 L_R, D, T are as defined in Pt 3, Ch 1,5.2 C_{WL} as defined in Table 3.3.1 F_λ as defined in Table 3.3.2 l_e = as defined in Ch 2,2.6 but is to be taken not less than 1,5 m D_2 = $T + H_b$ metres, where H_b is the minimum bow height, in metres, obtained from Pt 3, Ch 2,5.3 H = vertical framing depth, in metres, of sideframes, but is to be taken not less than 2,5 m (see Note 1) S_1 = vertical spacing of peak stringers or height of lower deck above the peak, in metres S_2 = vertical spacing of panting stringers, in metres \bar{C} = end connection factor, see Table 3.3.2 f_L = 1,32 aft of 0,15 L_R = 1,0 from 0,2 L_R to 0,8 L_R = 1,71 fwd of 0,85 L_R Intermediate positions by interpolation z = height above baseline in metres		$h_{T1} = (T - z + f_L f_{CW} C_{WL}) F_\lambda$ below T = $f_L f_{CW} C_{WL}, F_\lambda$ above T but not less than $f_L F_\lambda L_1/70$ f_{CW} = 0,5 at baseline = 1,0 at 0,65 D_2 and above Intermediate positions by interpolation (see Note 5) f_1 = 3,5 forward and 3,2 aft F_s = fatigue factor for side longitudinals for built symmetric sections, flat bars, bulbs and T bars = 1,05 at keel, 1,1 at T , 1,0 at 1,6 T and above for angle bars = $0,5 \left(1 + \frac{1,1}{k_s} \right)$ at keel = $\frac{1,1}{k_s}$ at $\frac{D}{2}$ = 1,0 at 1,6 T and above built asymmetric sections will be specially considered. Intermediate values by linear interpolation	
NOTES			
1. Where frames are inclined at more than 15° to the vertical, H is to be measured along a chord between the span points of the frame.			
2. The modulus for these members need not exceed that derived from (4) using H in place of S_1 .			
3. Where struts are fitted midway between transverses in double skin construction, the modulus of the side longitudinals may be reduced by 50k per cent from that obtained for locations (2) and (3) as applicable.			
4. Shell framing is also to comply with the requirements for bottom slamming and bow flare impact in Sections 14 and 15 respectively.			
5. For ships where $T > 0,65D_1$, the distribution of f_{CW} will be specially considered.

(1) Side transverse web frames in dry spaces	$Z = 9,0k_s S h_{T1} l_e^2$	—
(2) Side transverse web frames in deep tanks (a) midships (b) aft of $0,2L_R$ (c) fwd of $0,8L_R$	$Z = 9,4k_s S h_4 l_e^2$ $Z = 11,0k_s S h_4 l_e^2$ $Z = 11,0k_s S h_4 l_e^2 f_\gamma$ or as (1) above, whichever is the greater	$I = \frac{2,5}{k_s} l_e Z$
(3) Side transverses in dry spaces above $1,6T$ (see Note 2)	$Z = C_2 k_s S T H \sqrt{D}$	—
Transverse framing system:		
(4) Side stringers in dry spaces	$Z = 7,0k_s S h_{T1} l_e^2$	—
(5) Side stringers in deep tanks	$Z = 9,4k_s S h_4 l_e^2$ or as (4) above, whichever is the greater	$I = \frac{2,5}{k_s} l_e Z$
(6) Web frames in dry spaces above $1,6T$ (see Note 2)	$Z = C_3 k_s S T H \sqrt{D}$	—
(7) Web frames supporting side stringers	Z determined from calculation based on following assumptions: (a) fixed ends (b) point loadings (c) head $f_\gamma h_4$ or $f_\gamma h_{T1}$ as applicable (d) bending stress $\frac{100}{k_s}$ N/mm ² (e) shear stress $\frac{90}{k_s}$ N/mm ²	$I = \frac{2,5}{k_s} l_e Z$
Symbols		
<p>p, s, S, k_s are as defined in 3.2.1 D, T, L_R are as defined in Pt 3, Ch 1,5.2 h_4 = tank head, in metres, as defined in Table 3.3.6 L = load head, in metres, measured from mid-point of span to upper deck at side amidships l_e = effective length of stiffening member, in metres, see Ch 2,2.6 h_{T1} = as defined in Table 3.3.3</p>		
<p>f_γ = measured at midspan of member fwd of $0,8L_R$ = 1,0 at base line = B_f at $0,6D$ above base = $0,5(B_f - 1) + 1$ at D above base = 1,0 at any depth aft of $0,8L_R$ B_f = see Fig. 3.3.2 for frame members fwd of $0,8L_R$ = 1 for framing members aft of $0,8L_R$ C_2, C_3 = from Fig. 3.3.4 H = vertical height between decks in metres</p>		
<p>intermediate values by linear interpolation</p>		
<p>NOTES</p>		
<p>1. For primary structure in way of machinery spaces and also forward of $0,8L_R$ the minimum web depth is not to be less than 2,5 times the depth of adjacent frames or longitudinals as appropriate. Stringers forward of $0,8L_R$ may be 2,2 times the depth of the adjacent stiffener.</p>		
<p>2. For stringers and webs in fore peak tanks or deep tanks, see Pt 3, Ch 2,3.8.</p>		
<p>3. The breadths and effective length should be measured along the line of the shell.</p>		

Scantling Determination

Volume 1, Part 6, Chapter 3

Section 3

**Table 3.3.5 Watertight and deep tank bulkhead and deck scantlings**

Item and requirement	Watertight bulkheads and decks	Deep tank bulkheads, decks and collision bulkheads
Plating		
(1) Plating thickness for plane, symmetrically corrugated and double plate bulkheads	$t = 0,004s \beta \sqrt{h_4 k_s}$ mm but not less than 5,0 mm	$t = 0,0057s \beta \sqrt{h_4 k_s}$ mm but not less than 6,0 mm
Secondary stiffening		
(2) Modulus of rolled and built stiffeners, swedges, double plate bulkheads and symmetrical corrugations	$Z = \frac{s k_s h_4 l_e^2}{71 f_s (\omega_1 + \omega_2 + 2)}$ cm ³	$Z = \frac{s k_s h_4 l_e^2}{22 f_s (\omega_1 + \omega_2 + 2)}$ cm ³
(3) Inertia of rolled and built stiffeners and swedges	—	$I = \frac{2,3}{k_s} l_e Z$ cm ⁴
Primary stiffening		
(4) Stringers or webs supporting vertical or horizontal stiffening: (a) Modulus (b) Inertia	$Z = 5,0 k_s h_4 S l_e^2$ cm ³ —	$Z = 10,5 k_s h_4 S l_e^2$ cm ³ $I = \frac{2,5}{k_s} l_e Z$ cm ⁴
Symbols		
s, S, k_s are as defined in Table 3.2.1 l_e = effective length of stiffening member in metres and for bulkhead stiffeners, see Fig. 3.3.3 f_s = 1,4 for rolled or built sections and double plate bulkheads = 1,6 for flat bars = 1,1 for symmetrical corrugations of deep tank bulkheads = 1,0 for symmetrical corrugations of watertight bulkheads		
h_4 = $0,1P_{bhp}$ for deep tank and watertight bulkhead plating = $0,1P_{bhs}$ for deep tank and watertight stiffening P_{bhp} and P_{bhs} are the bulkhead design pressures as defined in Pt 5, Ch 3,5.8 ω_1 and ω_2 are bulkhead end constraint factors, see Fig. 3.3.3 β = aspect ratio correction factor, see Ch 2,2.5.1		
NOTES 1. In no case are the scantlings of deep tank bulkheads to be less than the requirements for watertight bulkheads where watertight bulkheads are required by Pt 3, Ch 2,4. 2. Corrugated bulkheads are to comply with the requirements of Ch 2,2.3. Both the plate panels and section inertia and modulus requirements are to be assessed.		

Fig. 3.3.3 Bulkhead end constraint factors

Scantling Determination

Volume 1, Part 6, Chapter 3

Section 3

**Table 3.3.6 Deck plating**

Location	Minimum thickness, in mm, <i>see also</i> Ch 3,2.2	
	Longitudinal framing	Transverse framing
(1) Strength deck $0,3L_R$ to $0,7L_R$ (<i>see</i> Notes 1, 2 and 6)	The greater of the following: (a) $t = 9,0s_1 (0,059L_1 + 7) \sqrt{\frac{F_D}{k_L}} \times 10^{-4}$ (b) $t = (7,4s_1 \sqrt{L_R k_S} \times 10^{-4}) + 1,5$	The greater of the following: (a) $t = s_1 f (0,083L_1 + 10) \sqrt{\frac{F_D}{k_L}} \times 10^{-4}$ (b) $t = 0,001s_1 \sqrt{L_R k_S} + 2,0$
(2) Weather deck and exposed decks (<i>see</i> Note 2)	$t = (7,4s_1 \sqrt{L_R k_S} \times 10^{-4}) + 1,5$	$t = (7,4s_1 \sqrt{L_R k_S} \times 10^{-4}) + 1,0$
(3) Lower decks (a) effective (continuous) (b) non effective	$t = 0,011s_1 \sqrt{k_S}$ $t = 0,009s_1 \sqrt{k_S}$	
(4) Strength deck forward of $0,925L_R$ and aft of $0,075L_R$	$t = (5,0 + 0,018L_R) \sqrt{\frac{k_S s_1}{s_b}}$	
(5) Plating forming the upper flange of underdeck girders	Clear of deck openings, $t = \sqrt{\frac{A_f}{2,2k_S}}$ In way of deck openings, $t = 1,1 \sqrt{\frac{A_f}{2,2k_S}}$ Minimum breadth, $b = 760$ mm	
Symbols		
$s, S, L_1, p, k_L, k_S, f$ are as defined in 3.2.1 L_R as defined in Pt 3, Ch 1,5.2 s_1 as defined in Table 3.3.1 b = breadth of increased plating, in mm		
s_b = as defined in Table 3.3.1, except of aft of $0,05L_R$ equal to 850 mm F_D = as defined in 3.6 A_f = girder face area in cm^2		
NOTES		
1. The thickness derived in accordance with (1) is also to satisfy the buckling requirements of Ch 2,3 and minimum thickness requirements.		
2. The deck thickness is to be not less than the basic end deck thickness as given in (4).		
3. Where a deck loading exceeds $43,2 \text{ kN/m}^2$, the thickness of plating will be specially considered.		
4. The exposed deck taper thickness is to extend into a forecastle or poop for at least one third of the beam, B , from the superstructure end bulkhead.		
5. For decks forming the boundary of a tank the plating thickness is to be 1,0 mm in excess of the requirements in Table 3.3.5 (1) for deep tanks.		
6. Strength deck plating from $0,075L_R$ to $0,3L_R$ and $0,7L_R$ to $0,925L_R$ is to be determined by assuming a linear taper from the midship value (1) to $t = (5,0 + 0,018L_R) \sqrt{k_S}$ at $0,075L_R$ and $0,925L_R$. The plating thickness determined is not to be less than (4). The total area of strength deck plating at $0,075L_R$ and $0,925L_R$ is not to be less than 30 per cent of the midship value, <i>see</i> 3.7.		

Scantling Determination

Volume 1, Part 6, Chapter 3

Section 3

Table 3.3.7 Deck longitudinals (longitudinal framing)

Location	Modulus, in cm ³
(1) Strength deck 0,3L _R to 0,7L _R	$Z = 0,039 s k_s h_{T1} l_e^2 F_1$
(2) Weather deck and exposed deck (a) 0,075L _R to 0,8L _R (b) Weather deck fwd of 0,8L _R (see Note 3) (c) Weather deck aft of 0,075L _R	$Z = s k_s (360h_1 + 0,0045 (l_e L_2)^2) \times 10^{-4}$ $Z = f_L s k_s (360h_1 + 0,0045 (l_e L_1)^2) \times 10^{-4}$ $Z = 0,0067 s k_s h_1 l_e^2$ or (a) above whichever is greater
(3) Lower decks (a) Stores, machinery and hangar decks (i) effective (ii) non effective (b) Accommodation decks (see Note 1) (i) effective (ii) non effective	$Z = s k_s (5,4L_1 + 23h_2 l_e^2) \times 10^{-4}$ $Z = 0,0045 s k_s h_2 l_e^2$ $Z = s k_s (4,7L_1 + 23h_2 l_e^2) \times 10^{-4}$ $Z = 0,0039 s k_s h_2 l_e^2$
(4) Strength deck in way of superstructure	To be specially considered
Symbols	
ρ, L_1, L_2, s, k_s are as defined in 3.2.1 D, T, L_R are as defined in Pt 3, Ch 1.5.2 F_D = as defined in 3.6 $C_1 = \frac{60}{225 - 165F_D}$ d_w = web depth of longitudinal, in mm, see Note 2 $F_1 = 0,25C_1$ l_e = as defined in Ch 2.2.6, but not to be taken less than 1,5 m h_{T1} = the greater of $\frac{L_1}{70}$ or 1,20 m $f_{FB} = \frac{0,0914 + 0,003L_R}{D - T} - 0,15$	h_2 = deck pressure head (see Note 4) = 2,6 for machinery spaces, workshops or hangers = 2,0 for stores = 1,2 for accommodation decks and void spaces = h_m for general cargo spaces h_m = general cargo deck pressure head, to be taken as equivalent to the pressure head produced by filling the hold to its full depth at a stowage rate of 1,39 m ³ /tonne, unless specified otherwise, (see Note 6). fwd of 0,925L _R $f_L = 1,57$ $h_1 = 1,8$ from 0,88L _R to 0,925L _R $f_L = 1,43$ $h_1 = 1,5$ aft of 0,88L _R $f_L = 1,23$ (see Note 3) $h_1 = 1,2 + 2,04f_{FB}$
NOTES 1. Where weather decks are intended to carry deck equipment and the load is in excess of 8,5 kN/m ² , the scantlings of longitudinals will be specially considered. 2. The web depth of longitudinals, d_w is to be not less than 60 mm. 3. For taper end modulus calculation $f_L = 1,23$ at 0,925L _R . 4. Where the deck forms the boundary of a tank, the additional requirements of Table 3.3.5 for deep tanks are to be applied. 5. The modulus of strength deck longitudinals from 0,075L _R to 0,3L _R and 0,7L _R to 0,925L _R is to be determined by assuming a linear taper from the midship value (1) to the basic weather deck value (2) at 0,075L _R and 0,925L _R . The modulus determined is not to be less than 2(b) or 2(c), as appropriate, see 3.7. The total area of longitudinals at 0,075L _R is not to be less than 50 per cent of the midships value. 6. If the hold does not have a uniform cross-section the breadth and/or length averaged over the averaged depth, to an equivalent rectangular section, may be used when determining the volume of the hold.	

3.13 Superstructures, deckhouses and bulwarks

3.13.1 The thickness of deck plating is to be as required by Table 3.3.9.

3.13.2 The scantlings of deckhouse and superstructure side, ends and deck stiffening are to comply with the requirements of Table 3.3.10.

3.13.3 The section modulus of deck girders and transverses is to be in accordance with the requirements of 3.12.3 using H_g equal to 0,1P_{wd}, 0,1P_{dh} or 0,1P_{in} as appropriate, where P_{wd}, P_{dh} and P_{in} are defined in Pt 5, Ch 3.3.5.

3.13.4 The thickness of the superstructures and deckhouses is in no case to be less than the appropriate minimum requirements given in Section 2.

3.13.5 Additional requirements for superstructures, deckhouses and bulwarks are indicated in Section 11.

3.13.6 Superstructure deckhouse and bulwark stiffeners are to be continuous or efficiently bracketed top and bottom. Where this is impractical the modulus is to be increased by 20 per cent and the ends welded to the deck all round.

NOTES																					
1. Where weather decks are intended to carry deck cargo and the load is in excess of 8,5 kN/m ² , the scantlings of beams may be required to be increased to comply with the requirements for location (2). 2. The web depth of beams, d_w , is to be not less than 60 mm. 3. Where decks form the boundary of a tank, the additional requirements of Table 3.3.5 for deep tanks is to be applied.																					

3.14 Single and double bottom structures

3.14.1 Single bottom scantlings are to comply with the appropriate minimum requirements given in Section 2. For the forward region, the requirements of Table 3.3.12 are to be complied with.

3.14.2 Double bottom scantlings are to comply with Table 3.3.11 and the appropriate minimum requirements given in Section 2.

3.14.3 In the forward region, the requirements of Table 3.3.13 are to be complied with.

3.14.4 Additional requirements for single and double bottom structures are indicated in Section 7 and 8.

3.14.5 Where there are large unsupported areas of double bottom and single bottom structure, the designers calculations are to be submitted.

Table 3.3.9 Superstructure plating

Location	Thickness, in mm
(1) Superstructure and deckhouse fronts, sides and backs	$t = 0,00126 s \beta \sqrt{k_s P_{dh}}$
(2) Exposed decks on superstructures	$t = 0,00126 s \beta \sqrt{k_s P_{wd}} + 1,5$
(3) Internal decks in superstructures and deckhouses	$t = 0,0017 s \beta \sqrt{k_s P_{in}}$
Symbols	
<p>s, f, k_s are as defined in 3.2.1 P_{dh} = deckhouse pressure, see Pt 5, Ch 3,5.5 P_{wd} = weather deck pressure, see Pt 5, Ch 3,3.5 P_{in} = internal deck pressure, see Pt 5, Ch 3,5.3 β = aspect ratio correction factor, see Ch 2,2.5.1</p>	
NOTE	
Deckhouses and superstructures subjected to hull girder stress are to comply with the buckling requirements of Ch 2,3.	

Table 3.3.10 Superstructure framing

Location	Modulus, in cm ³
Superstructure and deckhouse fronts, sides and backs: side longitudinals and side frames (see Note 1)	$Z = 0,0006 P_{dh} s k_s l_e^2$
Exposed decks: deck beams and deck longitudinals, (see Note 2)	The greater of the following: (a) $Z = 0,0006 P_{wd} s k_s l_e^2$ (b) $Z = 0,025 s$
Internal decks: deck beams and deck longitudinals	The greater of the following: (a) $Z = 0,0006 P_{in} s k_s l_e^2$ (b) $Z = 0,025 s$
Symbols	
<p>s, k_s as defined in 3.2.1 l_e = effective length of stiffening member as defined in Ch 2,2.6 f_{FB} = see Table 3.3.7 P_{dh} = deckhouse pressure, see Pt 5, Ch 3,3.5 P_{wd} = weatherdeck pressure, see Pt 5, Ch 3,3.5 P_{in} = internal deck pressure, see Pt 5, Ch 3,5.3</p>	
NOTES	
<p>1. The section modulus of side frames forming part of the side shell are to comply with the requirements for shell envelope framing. 2. The section modulus of superstructure stiffening is not to be less than that required by Table 3.3.7 and 3.3.8 for full width superstructures.</p>	

Scantling Determination

Volume 1, Part 6, Chapter 3

Section 3

**Table 3.3.11 Double bottom requirements
(0,2L_R to 0,8L_R)**

Location	Thickness, in mm
Inner bottom plating, (see Note)	$t = 0,00122(s + 660) (k_s^2 L_R T)^{0,25}$
Longitudinal framing	modulus, in cm ³
Inner bottom longitudinals	The greater of the following: (a) $Z = (0,0017l_{e1} + 0,035)sk_s h_{T2} l_e^2 F_s F_1$ (b) $Z = (0,0017l_{e1} + 0,035)sk_s h_{T3} l_e^2 F_s F_1$
Transverse framing	
Inner bottom transverse frames	$Z = 1,7s k_s T l_e \times 10^{-2}$
Symbols	
s, k_s , are as defined in 3.2.1 L_R, T are as defined in Pt 3, Ch 1,5.2 $l_{e1}, l_e, h_{T2}, h_{T3}, F_1$ are as defined in Table 3.3.2 F_s is as defined in Table 3.3.3	
NOTE The thickness of the margin plate where fitted, is to be increased by 20 per cent.	

3.15 Fore peak structure

3.15.1 Internal structure in the fore peak is to comply with the requirements of Table 3.3.14.

3.16 Magazine structure

3.16.1 Magazine structure which is assessed in accordance with Pt 4, Ch 1,6.4 is to comply with the requirements of Table 3.3.15.

Scantling Determination

Volume 1, Part 6, Chapter 3

Section 3

Table 3.3.12 Single bottom construction forward, minimum requirements

Area	Item	Requirement
Longitudinal framing minimum requirements		
Centreline girder:	Thickness, in mm	$t = (0,007d_f + 1)\sqrt{k_s}$
Floors and Girders	Thickness, in mm Depth (d_f), in mm	$t = (0,006d_f + 1)\sqrt{k_s}$ but need not exceed $12\sqrt{k_s}$ As midship region, see Table 3.2.1
Bottom Transverses	Spacing, in metres	See Pt 3, Ch 2,3.4.4
Transverse framing minimum requirements		
Centreline girder	Thickness, in mm Modulus, in cm ³ Inertia, in cm ⁴	$t = 0,95\sqrt{L_R k_s}$ but not less than 6 mm forward of $0,925L_R$. Between $0,925L_R$ and $0,7L_R$, the thickness may taper to the midship thickness the greater of: $Z = 8k_s S h_5 l_e^2$ $Z = 8k_s S h_4 l_e^2$ $I = \frac{2,5l_e^2 Z}{k_s}$
Floors in tanks	Spacing Depth, in mm Thickness, in mm Face plate area, in cm ²	every frame $d_f = 83D + 150$ or 1400 whichever is the lesser $t = (5,5 + 0,23L_2)\sqrt{s_2/800}$ $A_f = 0,8S k_s B$
Girders in tanks	Spacing, in metres Depth, in mm Scantlings	$0,003s_f$ as for floors as midship region, see Table 3.2.1
Floors in dry spaces	Spacing Scantlings	every frame as midship region, see Table 3.2.1
Girders in dry spaces	Spacing, in mm Scantlings	$0,003s_f$ as midship region, see Table 3.2.1
Symbols		
L_2, S, s, k_s, ρ are as defined in 3.2.1 L_R, B, D are as defined in Pt 3, Ch 1,5.2 l_e = effective length of stiffening member h_4 = tank head, in metres, as defined in Table 3.3.5 h_5 = distance, in metres, from mid-point of span to the following positions: (a) forward of $0,85L_R$: 3 m above the deck height obtained from Pt 3, Ch 2,5.3 (b) at $0,8L_R$: the upper deck at side (c) between $0,85L_R$ and $0,8L_R$, by interpolation between (a) and (b) s_F = transverse frame spacing, in mm s_2 = spacing of stiffener, in mm, but to be taken not less than 800 mm		
NOTES 1. For ships having one or more longitudinal bulkheads the maximum spacing may be increased but is not to exceed that for the midship region. 2. Frame structure is to comply with the requirements of Table 3.3.5. 3. See also the requirements for bottom slamming and bow flare impact.		

Scantling Determination**Volume 1, Part 6, Chapter 3**

Section 3

Table 3.3.13 Double bottom construction forward

Item and parameter	Requirements	
	Transverse framing	Longitudinal framing
(1) Centreline girder: (a) Thickness forward of $0,075L_R$ from the F.P.	$t = (0,007d_{DB} + 2)\sqrt{k_s}$ mm (see Note 2)	
(2) Plate floors: (a) Maximum spacing forward of $0,8L_R$ (b) Maximum spacing aft of $0,8L_R$ (c) Scantlings	$0,002s_F$ m As for midship region As for midship region	2,5 m As for midship region, see Table 3.2.1 As for midship region, see Table 3.2.1
(3) Watertight floors and bracket floors	As for midship region	As for midship region
(4) Side girders (see Note 1): (a) Maximum spacing forward of $0,8L_R$ (b) Maximum spacing aft of $0,8L_R$ (c) Scantlings	$0,003s_F$ m As for midship region As for midship region	$0,004s_L$ or 3,7 m whichever is the lesser As for midship region, see Table 3.2.1 As for midship region, see Table 3.2.1
